W. R. TOWNSEND (*Amer. Journ. of Orthop. Surg.*, August, 1908) says the prevention of deformity has always been considered by orthopaedic surgeons as of the utmost importance, but in most diseases they have been able to accomplish but little in a practical way as they have rarely been permitted to see cases until after the deformity has occurred. This statement applies with particular force to the deformities following infantile paralysis. A recent epidemic in New York, probably the largest in numbers ever known, has provided the author with an opportunity for a study of these cases from the onset. Whereas in 1906 but 39 cases were seen at the hospital for ruptured and crippled, in 1907 387 applied which had been stricken with the disease that year. The first fact of importance noticed was the large number applying during the early stages of the disease. The plan followed was to advise complete rest until all symptoms of hyperaesthesia and of the weakness following the attack had passed. Many did not believe that the proper way to regain the lost power was to keep the limb quiet, and that this was beneficial was a most difficult matter to impress on them. That the cases so treated have done far better than the others is the firm belief of the writer. Warm coverings to the affected part were advised and some limbs were immobilized for a time in plaster-of-Paris. Later the galvanic current was given together with massage and salt baths, and a very gradual return to use of the muscles affected. As soon as it could be clearly made out that the paralysis of any muscle would, if not treated by orthopaedic measures, result sooner or later in a deformity, suitable apparatus was applied. The conclusions to be drawn from the study of these cases are that infantile paralysis if not treated suitably at the commencement is, in the majority of instances, followed by deformity and that practically all these deformities can be prevented by appropriate treatment. The prevention of the primary deformities tends to a greater degree of recovery and prevents the occurrence of secondary deformities.

OBSTETRICS.

146. Modern Treatment of the Puerperium.

OPITZ (*Med. Klin.*, January 3rd and 10th, 1909) has treated 235 puerperal women by Küstner's method of letting them get up very early. Unless contraindications—that is, sutured perineum, operations on the placenta, fever, great weakness, cardiac defects, or similar troubles—exist, he allows the women to get up as soon as they have thoroughly rested—that is, when one night has elapsed since delivery. They sit and walk about as they like, only after mid-day they must go to bed for a few hours. None are forced to get up early, and the unanimous opinion of cultured women treated thus was that they felt incomparably better and recovered quicker when they were able to quit bed earlier. Opitz attributes the pallor, languor, and dizziness on getting up at the end of fourteen days and many cases of thrombus to the long lying in bed of the old treatment. Immediately after delivery each patient receives a firm body bandage fastened by straps, and a strap passes between the legs to keep up any protrusion of the genitalia. Gymnastic exercises, according to the individual strength, are usually undertaken from the second day—that is, rising up from the back without help from the arms, exercises for the perineal muscles, etc. The perineum is also played upon by tepid and cold sprays. Of 235 women, 56 got up on the first day, 65 on the second, 27 on the third, 52 from the fourth to sixth days, 21 on the seventh and eighth days, and 14 later. In the cases getting up from the fourth to sixth days special reasons—ruptured perineum, etc.—prevented them getting up earlier. The three chief dangers, according to the opponents of the treatment, are: (1) Embolism,

(2) uterine displacement, (3) interruption of convalescence. (1) In the clinics where this treatment has been tried emboli have not occurred; the longer bed is kept the greater the retardation of the blood stream and the easier thrombus formation. (Where a thrombus exists, absolute rest in bed is, of course, urgently indicated.) (2) Küstner and others have long proved that in the upright position ante flexion of the uterus is increased. Opitz's statistics show that getting up early does not favour retroflexion, and slack abdominal walls are the exception. Involution is satisfactory. Of the 121 examined on the tenth or eleventh days, and who had got up from the first to third days, the uterus was the size of a fist or larger in 33, about the size of a goose-egg in 58, smaller than this down to almost normal size in 30 cases. (3) Convalescence was in no way interrupted, and no increased tendency to puerperal infection was shown by those getting up on the earlier days, though existing infection may certainly be made much worse by early movement. Opitz observed no marked effect of the getting up early on the pulse, and his cases do not bear out Stöckel's opinion that scopolamin is a cause of rapid pulse. The chief difficulty is to prevent the newly-delivered woman from leaving hospital, and this method is more risky in private, where such exact observation of the patient is not possible. It is very important that the mind should be quite at rest, and no household duties should be undertaken, and very few visits received. Only 5 of the 235 women developed mastitis, in every case slight. The prophylactic treatment during the last six weeks of pregnancy consists in thoroughly cleansing the breasts with warm water and soap every other night, drying them and touching them with 10 per cent. tannin spirit. Later, after each feed the nipple is covered with lanolin ointment, which is washed off, before the child is put to the breast, with boracic lotion or boiled water. Cases treated with gaudanin were not so successful. If rhagades appear the child is put to the breast with a nipple shield. In the 1.28 per cent. cases in which mastitis occurred (compared with 3.18 per cent. of Olshausen's cases) the child was not put to the breast any more; the breast was bandaged up and packed with an aluminium acetate compress. No further treatment was required. Whenever possible only one breast is used at one feed, a quarter of an hour being the maximum time allowed. At night the children are all separated from their mothers. As regards Wassermann's syphilis reaction, of 135 mothers, 12 gave positive results, while only 7 children gave the serum diagnosis. In few of these cases did either mother or child show any clinical signs of syphilis. Of 163 women on whom Wolf-Eisner's ophthalmic reaction for tuberculosis was tried, 39 reacted positively, while only 2 showed clinical signs of the disease. Pirquet's skin reaction remained negative in the corresponding infants. Opitz allowed the mothers to suckle unless the tuberculosis seemed to be progressive, which only occurred once. He takes Walcher's standpoint, and anticipates better nutrition and sometimes dying-out of the tuberculosis when they are allowed to suckle. He allows ordinary diet, but articles likely to cause flatulence are avoided. The children are first put to the breast at the end of twenty-four hours, and in few cases did the nourishment prove insufficient. From the outset only six meals are allowed, at 6, 9, 12.30, 4, 7, and 10 o'clock. During the night the children are not fed at all. After birth 1 per cent. of silver nitrate is dropped into the eyes of each infant, but after Herff's experience Opitz will change to sophol. The treatment of the navel consists in ligaturing the cord about 2 c.cm. from the umbilicus. After the bath, the navel is dabbed with alcohol, covered with sterile gauze, and a gauze bandage wrapped round the body. If the navel is soiled with urine the bandage is changed, and after dabbing with alcohol powdered xeroform is employed. The remains of the cord fall off between the fifth and ninth days, occasionally not till the tenth. Until this occurs the baby is washed but not put in a bath.

GYNAECOLOGY.

147. Haematometra after Pregnancy.

BRINDEAU (*Annales de Gyn. et d'Obst.*, February, 1909) reports two cases of acquired haematometra—a condition much less frequent than the congenital type. A young woman was delivered early in 1904, and suffered from puerperal complications. The periods reappeared, and then ceased; but, when due, violent hypogastric pains set in with a sensation of weight in the perineum. There was always obstinate constipation at the same time. These

disturbances subsided in two or three days, but a tenderness in the abdomen persisted. In the summer of 1908 Brindeau examined the patient and defined a spherical tumour like a pregnant uterus, which reached up to the pubes above, and bulged inferiorly into the vagina, coming down to within an inch of the vulvar cleft. The tumour was smooth and tense, and no trace of a cervix or external os could be detected. On palpation it was found to be of an hour-glass shape, as though the uterine cavity and cervical canal were distended separately; and, further, the cervix was separated from the uterus by a sharp angle—a marked ante flexion. The round ligaments could be felt to be very tense. An incision was made in the middle of the vaginal part of the tumour, and a tumblerful of a black, syrupy, odourless liquid came away. The incision was enlarged, and then it was found that the cervical canal was the seat of the distension, the upper lobe of the tumour being the uterus, firm and retracted, seated on the top of the cervix converted into a blood cyst. The cavity was plugged with a strip of gauze. Ten days after the operation the catamenia set in, and were painless. Three months later the patient was well, and the periods were regular. The second patient had contracted pelvis and albuminuria. Basiotripsy had to be performed in labour, and the puerperium was complicated. The periods did not return, and six months later a haematometra developed. It was treated like the first case, and with similar success.

148. The Revival of the Vaginal Surfaces in Colporrhaphy.

YAUVERTS (*Le Nord Méd.*, November 1st, 1908) points out a little modification which he has employed for the purpose of facilitating the removal of the strip of mucous membrane in the repair of the perineum. Having marked out the extent of the denudation, he seizes the upper corner of the patch with artery forceps, and places the left index finger underneath, folding the mucous membrane over it. In this way it is easily and safely removed, by means of either bistoury or scissors, care being taken not to leave any islands of intact mucous membrane to prevent accurate adhesion of the raw surfaces.

THERAPEUTICS.

149. Collargol Enemata in Typhoid Fever.

T. MIRONESCU (*Berl. Klin. Woch.*, January 4th, 1909) finds that serumtherapy has not yet gained a firm foothold in practice, and that Brand's cold water treatment is still the classical method of treating typhoid fever. It has reduced the mortality considerably. Modern teaching has shown that this disease is a general and not a local condition, and that the intestinal symptoms are only prominent, while the causal microbe is to be found elsewhere as well. It can be regarded as a septicaemia, especially in the early stages, and for this reason it is rational to deal with it as other forms of septicaemia are dealt with. Collargol has proved itself of value in the treatment of the various forms, and indeed this drug has also been tried in typhoid fever. It has been warmly recommended by a number of observers; but on the whole the results have been disappointing, which the author believes to be due to the fact that comparatively small doses were employed. Large doses of collargol have been given in septicaemia by Seidel as enemata, and good results were obtained. For this reason the author has treated cases of typhoid fever with collargol enemata. Each patient was given one or two enemata daily containing 5 grams of collargol in 100 grams of water. A cleansing enema was given first. When the collargol enemata were not retained, 10 to 12 drops of tincture of opium were added to them. When even these were not retained, he gave collargol by the mouth in capsules containing 1 gram each. The effect was much more marked when given in large doses per rectum than when given by the mouth. Even when 10 grams were given daily for from ten to twelve days no intoxication was produced. In all, 17 cases were treated in this way, and the results were compared with those obtained by cold water treatment alone. The cases were taken at random, and included severe instances of typhoid fever. The fever was beneficially influenced, the general condition was improved, the duration of the illness was shortened, and the frequency of complications was diminished. As a rule, the temperature fell gradually, and only when the enemata were given late was there anything approaching a critical fall. With regard to the cutting short of the attack, he states that the fever lasted from ten to fifteen days longer

in the cases treated by cold water than in the cases treated with collargol emenata. In a certain number of cases the initial leucopenia disappeared after the treatment. Among the 17 patients treated with cold water 4 died, while none died who had been treated with collargol. He is therefore inclined to regard the collargol emenata treatment of typhoid fever as a very effective one.

150. Intravenous Arsenic and Tuberculin Treatment.

F. MENDEL considers that since the organism loses its power progressively to manufacture antibodies in tuberculosis, and since all attempts to immunize in a passive manner have failed, all the methods of curing the disease specifically have been unavailing (*Munch. med. Woch.*, January 5th, 1909). It therefore becomes necessary to employ the specific products of the bacilli in order to obtain a curative action in such a way as not to produce deleterious effects, and at the same time to improve the nutrition and raise the resistance. For this purpose he believes that a combined treatment with tuberculin and arsenic can be recommended. Whatever the views are in connexion with the value of tuberculin in the treatment of tuberculosis, he claims that when properly applied it can assist the organism in forming those protective substances which tend to counteract the poison of the disease. Koch showed in 1901 that when given intravenously, even in minimal doses, tuberculin (T.O.) raises the agglutinating power of the serum of tuberculous subjects rapidly. This may not be accepted as absolute evidence in favour of the increase of the above-mentioned protective substances, but other facts tend to support this view. Tuberculin produces an inflammatory stimulation in the neighbourhood of the tuberculous foci, which stimulation if not excessive induces an active hyperaemia in the perituberculous zone. Mendel conceives the idea of utilizing this perituberculous inflammation in his combined treatment without relying on the tuberculin to cure the disease. It is known that certain drugs are attracted and deposited in preference by inflammatory stimulation. If one can succeed in producing a perituberculous inflammatory reaction of mild degree by means of very small doses of tuberculin, a simultaneous application of arsenic will lead to the attraction of this metal to the foci and the formation of a nutritive stimulation, which should form an adequate protection against the process going on in the diseased foci. He chose atoxyl for this purpose, and, using a 15 per cent. solution, injected 0.05 gram, increasing to 0.3 gram. These doses do not produce any toxic symptoms when applied intravenously. The atoxyl injections were repeated every two days, but it was found unnecessary and undesirable to increase the tuberculin doses more frequently than every week. Severe febrile reactions should be avoided, but moderate general reactions with slight fever increase the activity of the treatment. The patients treated in this way were suffering from the first or second stage of the disease. The general condition of the patients improved during the treatment, the appetite improved, the weight increased, the night sweats diminished, and the cough got better. The number of rales diminished and the quantity of sputum also was lessened, while the character was changed from a purulent to a clear type. He considers that the combined treatment is adapted for cases which do not improve under the ordinary sanatorium treatment, and also to ambulatory patients who are well enough to visit the physician at his house.

151. Phtysoremid.

UNDER the fancy name of "phtysoremid" Krause has introduced Koch's bacillary emulsion in capsule form, which he warmly recommends for internal treatment of tuberculosis. F. Köhler has tried this remedy in a series of 42 cases. He had previously tried old tuberculin in pill form without obtaining satisfactory results (*Munch. med. Woch.*, January 26th, 1909). His results with phtysoremid were as follows: 7 patients were cured—that is, showed no signs of disease after the treatment; 7 were nearly cured, 14 were not benefited, and 13 got worse. The last patient interrupted the treatment before a definite conclusion could be formed. Two out of the 13 patients who got worse died. The results were therefore not at all good, and he is satisfied that when given by the mouth bacillary emulsion is not useful. He notes, however, that while the patients were not doing well, as far as the clinical signs were concerned, they put on weight in an extraordinary manner. This leads him to the conclusion that more care should be exercised before a prognosis is based on increase of weight. In mild cases phtysoremid may be given as an

adjunct to the usual treatment, provided that too much is not expected. He begins with one "weak" capsule daily, and increases this to three or four. Then he gradually goes on to the "strong" capsules. The patient should take from 100 to 200 capsules during the treatment.

PATHOLOGY.

152. Variations of Catalase Ferment in Disease.

WINTERSTERN and MELOT (*Journ. of Exper. Med.*, November, 1908) have investigated the presence in the human body of catalase, which is a ferment characterized by its power of decomposing hydrogen peroxide. In nephritis they find a diminution in the amount of this ferment in all the tissues examined—namely, kidney, blood, lung, liver, and spleen—but the reduction is most marked in the renal tissue. This reduction varies directly with the severity of the pathological lesions in the kidneys and the clinical symptoms. The urine also in cases of nephritis shows a much greater inhibiting power than normal urine. "This may be accounted for by the reaction of the urine, and subsequent work must prove whether or not the kidney takes any more active part in nephritis and secretes into the blood and urine a substance which manifests itself by a reduction in the catalytic activity." In the two cases of eclampsia which the authors have examined the catalytic activity of the blood was not reduced. They consider that these last observations may prove to be of great importance, because, if substantiated by a sufficient number of further cases, they will establish the use of a ready method for differentiating during life between eclampsia and nephritis. In pneumonia they find that during the stage of red hepatization the lung has an increased catalytic activity. This increase varies directly with the number of intact red blood corpuscles in the exudate and in the engorged capillaries. This influence of the red corpuscles is also shown in fresh haemorrhagic infarcts, where the increase of catalytic activity is very great. In grey hepatization, on the other hand, there is no increase. In tuberculosis the lung shows a decreased activity, probably owing to the lack of blood in the diseased area, while the lowered activity found in the other organs may also be explained by the anaemia and emaciation associated with the disease. In the cases of diabetes mellitus and jaundice which the authors investigated there was no increase of catalytic activity. One case of asphyxiation by illuminating gas and also one case of congenital syphilis, showed a marked lowering of catalytic activity. The diminution effected by *post-mortem* change is only slight, and does not affect the results recorded. There is no marked change in the catalytic activity due to age.

153. Agglutination Studies in Tuberculosis.

H. R. M. LANDIS (*Proc. of the Path. Soc. of Philadelphia*, 1907) says that although the existence of agglutinins in a serum is not regarded as having any part in the phenomenon of immunity, it is believed that their presence affords an index to the degree of immunity present, and that as the agglutination test is high or low, or subject to an increase or a decrease, we may determine the resistance of the organism to the special bacterium tested for. Recent work on agglutination in tuberculosis has been devoted to determining its value in estimating the degree of immunity obtained by means of specific or other forms of treatment, and in forming a prognosis. Under specific treatment with tuberculin the agglutination reaction can be greatly increased, and a decrease in the agglutination power or failure to increase is usually attended by an unfavourable outcome. The author has continued the study of the agglutination reaction as met with in cases of advanced tuberculosis at the Phipps Institute, and in cases under treatment at the White Haven Sanatorium, and in negroes in the wards of the Philadelphia Hospital. The test was also applied to effusions of various kinds obtained during life, and to fluids obtained from the serous cavities shortly after death. Further studies along these lines may throw additional light on the complex question of immunity in tuberculosis. In so far as the agglutination is concerned, our knowledge may be summarized as follows:—(1) That the reaction is valueless as a diagnostic agent. (2) That it forms an available means of estimating the degree of immunity attained in tuberculosis by means of tuberculin and other forms of treatment. (3) That the absence of the agglutinating reaction in fluids containing but little albumen, such as cerebro-spinal fluid, renders it highly probable that the agglutinins are closely allied to the albumens.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

154. Pleuritic Effusion.

F. LOMMEL (*Medizin. Klinik*, No. 4, Jahrgang v) reviews the recent advances made in the study of pleuritic effusion, advances which are partly of theoretical, partly of practical interest. The importance of the diminution of vocal thrill as a sign of pleural effusion has, perhaps, somewhat diminished. Arneith, as a result of the examination of 117 cases of pneumonia, arrived at the conclusion that, as a rule, vocal thrill was absent in the second stage of pneumonia; while Wolter supported Arneith in so far as he found the increased vocal thrill of pneumonia not constant, and observed an increased vocal fremitus in pleuritic exudate. A more recently observed physical sign of value in diagnosis, first described by Grocco, is the presence of a triangular area of diminished resonance on percussion situated on the sound side near the spine, with its apex at about the height of the upper limit of the effusion. Ranchfuss explains the area of dullness on the sound side as due to the fluid-filled recess arching over like a sac in front of the vertebral column; Rather, on the other hand, looks upon it as due to a weakening of the pleximeter action of the spine from an accumulation of fluid. On the affected side Krönig's recent description would make the three-cornered resonant area smaller than that formed by Garland's S-shaped upper boundary: the anatomical reason for this resonant area on the affected side is the drawing back of the lung still containing air on to its hilum. Illumination by Roentgen rays may clear up the diagnosis in cases of pleural effusion. By means of it the presence of small effusions which only fill up the pleural sinus can be demonstrated, and also effusions situated between the lobes of the lung, the effusion in the latter case being differentiated from abscess in the lung by the absence of elastic fibres in the sputum. Thickenings of the pleurae can be differentiated from effusions by the fact that the shadow due to thickening varies in intensity according to the distance from the screen, and thus, for example, a thickening of the posterior pleura will cast a more distinct shadow if the screen is behind than in front. The upper limit of a pleural effusion as tested by percussion may appear to be different from that obtained by Roentgen-ray illumination; but this does not necessarily show inaccuracy in percussion, because an effusion with a horizontal upper limit may throw a shadow whose upper line rises from within outwards as a result of the increased amount of fluid through which the lateral rays have to pass, and partly also because of the lateral part of the lungs being more readily compressed by fluid than the part near the root. In practice, the great question as to the course of a pleurisy is whether it is or is not tuberculous. The disadvantage of many of the methods of attempting to determine whether or not the fluid is tuberculous in origin by means of culture media or inoculations of animals, is the length of time which must elapse before certainty is arrived at. Thus Vetter uses a peptone glycerine water as culture medium, and finds the method more reliable than that of animal inoculations, but the time needed is from twenty-one to twenty-five days. When guinea-pigs are used and inoculations made into the peritoneal cavity, according to Grober, from three to four weeks is needed. Bloch shortens the time to from ten to fourteen days by injecting fluid into the bend of the groin, and injuring the lymph glands by pressure between the fingers. Weber arrives at much the same result in time by using subcutaneous injections. Nattan-Larrier inoculates a suckling guinea-pig at the base of the lacteal gland, and finds bacilli present in the milk at the end of five days; the only disadvantage of this plan is that, even in the larger institutes, there is not a constant supply of such animals. In a more restricted number of cases cyto-diagnosis is of great value. In general it may be said that an excess of lymphocytes as compared with polymorphonuclear leucocytes in an acute febrile condition denotes with great certainty a tuberculous affection, but the absence of lymphocytes does not exclude the possibility of tubercle. The question as to whether an effusion is essentially pleuritic or of the nature of a transudation does not, as a rule, present much difficulty, except where an inflammatory process is combined with a hydraemic transudation: in this connexion may be mentioned those obstinate right-sided pleural exudates which are not infrequently found in

combination with diseases of the cardiac muscle, and to which attention has been specially called by Gerhardt. Here the absence or insignificance of other pathological collections of fluid, the obstinate course and the tendency to relapse even where good diuresis is maintained, all go against the diagnosis of simple transudation. In considering the question of paracentesis in the case of serous or sero-fibrinous exudates, too narrow a constriction is not to be put on the vital indication. Gerhardt has shown how the injurious effect of a pleural exudate upon the lesser circulation is minimized by deepening of the inspirations, so that the intrapleural pressure in cases of recent exudation, where the pleurae are not much thickened, may be even more strongly negative than in health; the powerful muscular action needed to accomplish this may, however, suddenly fail through exhaustion, and thus cases of sudden death may be explained.

155. Diseases associated with Dentition.

HUTINEL in the *Annales de Médecine et Chirurgie* for March discusses the question, is dentition a cause of infantile disease? The opinion that it is has been held for centuries, but for the last fifty years it has been in dispute. Guersant maintains that the period of dentition is a time when the physical powers of resisting disease is at a low ebb, and he compares it to the menstrual, the puerperium, and the climacteric periods, when disease is easily acquired. He quotes Magitot, Politzer, and especially Dr. Comby, as holding the same view. But he also points out that one cannot by a stroke of the pen destroy the result of observations made by many physicians and maintained by the ancients. The ideas that the ancients had concerning cold have lost nothing of their accuracy, notwithstanding the discovery of the pathological agent of pneumonia; we have found, however, that cold lights up their virulence. Progress in medicine does not take place in one direct line—there are too many difficulties for that; it is by a series of zigzags that the ultimate goal is reached. Teething is accompanied by pain; this is manifested by the cries and the habit of biting in infants. The same can be seen in animals, such as a young dog. Delabarre proved fifty years ago that irritation of the nerves of the gum causes hyperaemia, redness and swelling of the tissues, and prolonged vasomotor trouble. This irritation of the gums is accompanied by increased secretion from the salivary glands, and also increase in the secretions of the whole of the intestinal tract, for the parts are intimately connected. The congestion disappears as soon as the tooth makes its appearance, and the retraction of the mucous membrane enables the tooth to grow rapidly. The turgescence favours infection. An infant just born, and during the first few days of life, is not infected; this comes with time. Hutinel proceeds to quote Drs. Rillet and Barthez as authorities who believe that diseases accompanying dentition are due to infection, and he states that this opinion is supported by Trousseau. Children suffer from diarrhoea because the infection starting at the mouth passes along the whole length of the intestinal tract. But to conclude that dentition apart from infection could, *per se*, cause serious diarrhoea, or infantile cholera, would be absurd. The pathological state has for its commencement a vicious alimentation, dentition further reduces the power of resistance, thus is produced a morbid congestion, which paves the way for bronchopneumonia. The diminution of the resisting powers is shown locally by stomatitis and aphthous patches in the month. The local infection is declared at a distance by the enlargement of the glands of the neck. But the first signs of infection may show themselves in the chest. Hutinel has frequently seen congestion and bronchitis both disappear with the first appearance of the teeth. Syphilis is readily contracted at this period of life. It is due to want of care on the part of attendants; it is seen at the anus, where may be found enormous mucous plaques; they may disappear by a few days' treatment. In childhood it is dentition that is the chief means of infection; in the adult it is decay of the teeth. The evolution of the teeth at any period constitutes a period of danger.

156. *Ascaris Lumbricoides* Escaping through Ear.

HOLM (*Ugeskrift for Læger*, No. 6, 1909) reports the case of an *Ascaris lumbricoides* passing through the Eustachian tube and out of the ear in a child 3½ years old. According

to the mother's account, the child whilst playing began suddenly to sneeze and scratch her nose, and after a few moments to scream in agonizing pain, holding her hand to her ear. The mother, thinking that the child, who had for some time been suffering from post-scarlatinal otitis media, was seized with sudden pain, began to syringe out the ear, when she noticed a worm trying to work its way out of the ear. She managed to pull it out, and brought it with her for inspection. The child was found to have a large defect in the tympanic membrane, but otherwise nothing abnormal was detected in the fauces.

SURGERY.

157. The Surgical Treatment of Suppurative Pericarditis.

ELIOT (*Annals of Surgery*, January, 1909), in concluding a review of 22 collected cases of suppurative pericarditis, holds that it cannot be too strongly emphasized that every case of this affection in which the patient is not moribund should be treated by an operation which, when a general anaesthetic cannot be tolerated, may yet be successfully carried out under some local anaesthetic. Puncture alone affords in most cases at the best but temporary relief, and, as a rule, the removal of pus in this way is but partial, and its reaccumulation is rapid. The use of this method should, it is urged, be exclusively restricted to diagnostic purposes. The author objects to the formation of a musculo-cartilaginous flap, including two or more costal cartilages, and also to Allingham's "epigastric" operation, which, though it offers the advantages of a dependent outlet, and of diminished risk of opening the left pleural cavity, is likely in its performance to take up too much time. The simplest and most rapid exposure of the pericardium is accomplished, the author states, by resection of the inner part of either the fifth or the sixth costal cartilage through an oblique incision of the skin made parallel to its long axis. After division of the perichondrium and the trianglularis sterni, the pleural angle in the absence of adhesions is pushed outwards without, if possible, any extension of the skin incision. If obliteration of the pleural cavity has taken place, the underlying pericardium may readily be opened without danger of exposing the left lung. The presenting pericardium should be divided by scissors between two pairs of forceps, the opening being of sufficient size to permit the passage of a finger. Irrigation with either a saline or a weak antiseptic solution is thought to be desirable, but it is pointed out that inadequate provision for the free exit of the injected fluid from the interior of the pericardium may determine a fatal issue. The irrigation may be dispensed with if the patient's condition be so bad as to indicate a speedy ending of the operation. The edges of the opening in the pericardium should, whenever it be possible, be sewn to the margins of the wound in the skin. Drainage, which is undoubtedly favoured by the movements of the heart, may be further assisted by the insertion of a rubber tube or of a capillary gauze drain. In a case under the care of the author drainage was kept up for several weeks without causing any trouble, but, as has been pointed out by Riedel, the presence of a rubber tube may excite stormy and irregular action of the heart. In cases of recovery subsequent impairment and irregularity of the heart's action are, the author asserts, marked exceptions, nor is the patient likely to suffer from any future indication of cardiac displacement. Such satisfactory result, however, it is pointed out, cannot always be expected. In 7 of the 22 cases collected by the author full details are wanting in regard either to the nature of the effused fluid or to the definite results of the treatment. In the remaining 15 cases resection of one or more costal cartilages resulted in 9 instances in recovery and in 6 in death. These results may be regarded as satisfactory, as suppurative pericarditis is in a great majority of instances a secondary infective disease. The fact that recovery may occur even when pyopericarditis is part of a general sepsis certainly warrants, the author believes, surgical interference under all circumstances in which the patient is not moribund as the best and, indeed, the only means of averting a fatal issue.

158. Bier's Methods of Surgical Treatment.

DEBIEZ (*Archiv. Prov. de Chirurg.*, No. 1, 1909) gives the results of his experience of Bier's method of treatment by blood stasis in some branches of surgical work, reserving his views on the application of this method to tuberculous

affections and diseases of bone for a future paper. In order to carry out this treatment properly and efficiently surgeons, it is held, should not trust to printed information but endeavour to acquire direct experience of the complicated technique of the method in Bier's own clinic. Arterial hyperaemia, the author reports, has given good results in the treatment of chilblains and in some cases of articular stiffness, but failed in cases of varicose ulcer and of chronic articular effusion of non-tuberculous origin. Venous hyperaemia, it was found, did not simplify the treatment of boils and whitlow. This latter method by hindering the development of infection exerts a favourable influence on soiled wounds, but it is difficult in such cases to estimate exactly the part played by Bier's method of establishing stasis, as stasis is usually applied under such circumstances by other means. In most cases of gonorrhoeal arthritis, even in its most severe forms, venous stasis will lead to a complete restoration of the function of the affected joint. The main condition of success in the application of the method of such cases is a thorough practical knowledge of its technical details. The most satisfactory results obtained by the author from venous stasis have followed its use in the serious cases of acute purulent arthritis of traumatic origin and due to streptococcal infection. In other cases of acute purulent arthritis no good results have been obtained. It is pointed out that in the treatment of articular affections exact immobilization of the diseased joint is incompatible with the application of stasis in accordance with Bier's principles, and that, consequently, it often happens that in subjecting articular disease to venous stasis with the hope of preserving complete mobility of the affected joint, a very unsatisfactory result is obtained, the articular surfaces being displaced and the patient after the treatment being left with a limb less useful than one in which ankylosis has taken place with the bones in good position. In concluding his paper the author asserts that venous stasis is capable in many cases of modifying rapidly and to a considerable extent the evolution of acute infective lesions, this action being manifested by favourable changes in the nature and amount of the secretion from the wound.

159. Cataract following Electric Shock.

M. TERRIEN, at the Ophthalmological Society of Paris (*Rec. d'Oph.*, November, 1908), described a case in which cataract in one eye came on two months after the patient had received a discharge of 500 volts, having accidentally touched a conductor with his hand. He remained unconscious for two hours, and was badly burnt about the forehead. Such cases are not infrequent, but must be distinguished from fulguration and direct lightning stroke. They have been carefully studied by Gonin (*Annales d'Oculistique*, 1904, t. cxxxi, p. 81). The cataract in Terrien's case was a soft one with moderate swelling of the lens, and matured rapidly. There can be little doubt that it was caused by the electric discharge.

OBSTETRICS.

160. Vaginal Thrombosis in Pregnancy.

FUNCK-BRENTANO (*Comptes Rendus de la Soc. d'Obstét. et Gynéc. et de Pédiat. de Paris*, etc., January, 1909) reports a case where a single woman, aged 22, became pregnant for the first time. Gestation, closely observed in the later months, proceeded normally; but one day very near term the patient felt something coming out of the vulva when she was raising the leg of a heavy table to disengage the corner of a table-cloth. She declared that she had not strained herself before during the pregnancy, and that the last coitus was in the third month. The patient was sent into a lying-in hospital, as it was suspected that the head of the child presented. Funck-Brentano found that an oval pedunculated body, of the size of a hen's egg, projected from the vulva. It somewhat resembled a loop of strangulated intestine, and blood oozed from its surface. The pedicle was short, but very distinct; it consisted of a fold of vaginal mucosa attached over an area $1\frac{1}{2}$ in. in diameter to the posterior column of the vagina, coming down at its lowest point to within $\frac{3}{4}$ in. from the fourchette. When it protruded it made a retrocele, which disappeared when it was reduced. The patient had varices of the labia and both lower extremities. The tumour was removed by division of the pedicle close to its attachment, a small artery was divided and ligatured. Labour set in five days later, and ended spontaneously. The tumour was examined under the microscope, and was reported to be a collection

of blood amidst a varicose plexus of veins in the substance of the vaginal mucosa. Brindeau described in 1903 a case where a pedunculated thrombus of the size of a cherry was detected two days after a normal labour. It was attached to the posterior column of the vagina, and in consistence resembled a testicle. It was not removed, and had most probably developed before labour. In all other recorded cases of vaginal thrombus associated with pregnancy the tumour made its appearance in the later months of pregnancy. In 12 out of 14 cases the patients were primiparae, and in 2 secundiparae; thus this tumour has never been observed in multiparae, and, besides, the patients were nearly all young, only 3 being over 24 years old. In 8 cases, at least, there were adjacent varices, and in only 1 was it specified that this complication was entirely absent. After the reading of Funck-Brentano's report there was some discussion as to whether the term "thrombus" was correct.

161. Glycosuria in Pregnant Women.

WILLIAMS (*Amer. Journ. of Med. Sci.*, January, 1909), in considering the clinical significance of glycosuria in pregnancy, points out the importance of determining whether the sugar in the urine indicates a true diabetes, or a transient, alimentary, or recurrent glycosuria, or merely a lactosuria. If no sugar occurs as lactose it is without clinical significance, and is probably associated with premature activity of the breasts. If a glycosuria of the alimentary type is present its clinical significance is also unimportant. The mere reduction of Fehling's solution is therefore an insufficient guide to the prognosis of any particular case, as it is essential to determine whether the sugar is present in the form of glucose or lactose. Practically this may be ascertained by using the fermentation saccharometer, as glucose ferments readily while lactose does not. If the glycosuria appears late in the pregnancy, does not exceed 2 per cent. in amount, and is not accompanied by symptoms, it is most probably transient and may disappear spontaneously or persist throughout the pregnancy, but in either event its clinical significance is slight, though the patient should be carefully watched. A more serious condition is that in which the sugar appears early in large amounts, as it may not be possible to make a positive diagnosis between glycosuria and a true diabetes until after delivery. Pregnancy occurring in diabetic women and diabetes manifesting itself during pregnancy are serious complications, though the prognosis is not so alarming as is usually stated, for the majority do perfectly well, and in only a smaller proportion is the condition fatal. If the amount of sugar is large and uncontrolled by treatment, the induction of abortion is indicated even in the absence of other serious symptoms.

GYNAECOLOGY.

162. Fibroids and Pregnancy.

BOSSI (*La Ginecolog. Mod.*, January, 1909) publishes some cases illustrating some of the complications and dangers associated with pregnancy and labour in the presence of fibroids. From a consideration of these and other cases he feels justified in the following conclusions. As a general guide to conduct in these cases one ought, as far as possible, to preserve the powers of procreation and their respective organs, not blindly, but with scrupulous and careful consideration of the merits in each individual case. Care should be taken to note whether pregnancy unduly accelerates the growth of the fibroid so as to indicate the necessity of induced labour. If it is decided to let the pregnancy go on, special attention should be paid to the circulatory, urinary, and hepatic systems. The question whether pregnancy should be allowed to go to full term or interrupted at some period short of that, but permitting a living child, must be determined by the judgement of the medical man. The presence of a fibroid need not condemn a woman to sterility either natural or forced, and *ceteris paribus* one ought to encourage rather than disparage fecundation in these cases. In many cases fibroids do not interfere in any way with the normal progress of a pregnancy, in others a viable premature child may be obtained and satisfactorily reared, and further, gestation seems in some cases to indirectly prove useful in the cure of a fibroid, for this shares in the general uterine involution which occurs in the puerperium, and sometimes to such an extent that subsequent pregnancy may occur without danger. On the other hand, sterility undoubtedly favours the development of uterine fibroids.

THERAPEUTICS.

163. Fresh Air in the Treatment of Disease.

EVIDENCE that fresh air is an important factor in the successful treatment of disease continues to accumulate. Dr. Edwin Graham (*Archives of Paediatrics*, February, 1909) relates his experience gained in the wards of the Philadelphia Hospital. Before adopting the open-air method he was puzzled to account for so many deaths among infants in his wards in spite of every care in diet and nursing. In his private practice, the same type of infants were doing well, almost without exception. He finally decided to try the open-air method for his hospital patients; even in the month of January he had the children placed for two hours each day on the fire-escapes. Towels were pinned over the top of each crib to shield the child from wind. The infant mortality began to lessen immediately. Dr. Graham continued this practice for two or three years with the greatest benefits to the children. New wards have since been constructed in the hospital, and for the last five years his patients have had an abundance of fresh air both by night and day. He is no longer a pessimist when in the infants' ward, but an optimist. In the Jefferson Hospital Dr. Graham uses the roof garden all the year round both summer and winter. He now treats all cases of bronchopneumonia and lobar pneumonia by the fresh-air treatment. The plan has been so much more successful than the older methods of treatment that he has lost more or less his dread of pneumonia as a hospital disease. The same line of treatment he adopts for typhoid patients, and his patients have done so much better that nothing would induce him to revert to the older methods. The special wards have large windows on both sides and an open door at the end; these are always open and the air of the wards is always cool, except once in two or three hours when the windows are closed whilst the children are examined for cleanliness. An effort is made to keep the hands and feet of the infants warm by means of gloves, stockings, and hot-water bottles. Dr. Graham has for the last five years adopted the open-air method of treatment for his private patients. On his first visit he instils into the mind of the mother that fresh air differs as much from stale air as fresh milk differs from impure milk. If the physician is enthusiastic the mother will be easily convinced. He finds rickets, scrofulosis, gastrointestinal disease, and all conditions, benefited by the fresh-air method of treatment. If possible, the temperature in which a child lies should be "indifferent"—that is to say, 75° F. in summer with summer clothing, and 65° F. in winter with winter clothing. Children stand cold air very well provided their bodies are kept warm. High altitudes are useful in children with incipient tuberculosis or an inherited tendency; there is increase in heat production and an augmented metabolism, proved by the larger amount of carbonic acid given off by the lungs, and as a rule there is an increase in the red blood corpuscles. Seaside air is indicated in children convalescing from severe illnesses, especially gastro-intestinal in type. Dr. Graham exhorts all medical men to unite in preaching fresh air, vote for open squares, endorse roof gardens, and the removal of adenoids and tonsils.

164. Meat Broth for Infants.

W. STOLTZNER (*Medizin. Klinik*, February 7th, 1909) has obtained excellent results, in the case of infants brought to him with gastro-intestinal symptoms due to a diet of flour foods and sugar, by putting them on to a mixture of milk and meat broth. Bretonneau in 1818 first attempted to feed young infants suffering from atrophic chronic gastro-intestinal symptoms on milk mixed with broth instead of with water; since that time the system of infant feeding has never fallen into absolute disuse. In France, some doctors recommending it, as did Bretonneau, only for atrophic infants, others for any infants for whom breast feeding was not obtainable. In Austria Mayer in 1850, Monti and v. Huttenbrenner later, have all advocated the dilution of milk by broth, Monti for children with rickets, and v. Huttenbrenner even for newborn children. In Germany A. Steffen recommends a mixture composed of 50 grams of milk, 50 grams of meat broth, 1 teaspoonful of cream, and 3.8 grams of milk sugar, as an infant food, failing human milk. Although from time to time the use of meat broths as a diluent of milk for infants has been recommended, it has never become widely popular. Stoltzner, in the present article, describes his own experience and finds that meat broth is indicated for cases of "tabes mesenterica," or atrophy, caused by a flour-food diet. He reports on 14 such cases, one of them dating back to 1905, the other 13 belonging to the

years 1907 and 1908. The broth used was made from beef or veal, and was of ordinary medium strength; sugar was never added to the mixture. The relative strength of milk and of broth in the mixture varied according to the case. The average age of the children was five months, with an average weight of 4.055 grams (9 lb. approximately). Seven of the children had never been breast-fed, the other 7 had been breast-fed on an average for 2.7 months. The length of time of feeding on flour food was not less on an average than two and a half months. Eight children during the whole of this time had not been given any milk at all; 6 had received small amounts of milk along with the carbohydrates; to this group belonged 1 child fed on Nestlé's food and 3 on condensed Swiss milk; 8 out of the 14 children suffered at the beginning of treatment from diarrhoea, which in some cases had persisted for weeks and months; 6 children were in an especially serious condition, 2 of them showed pronounced myotonia, 1 obstinately refused food; 1 child at 3 months weighed only 2.970 grams ($\frac{6}{16}$ lb. approximately). Unfortunately, in 9 cases the treatment was only carried out for a short time; but even these cases served to show that diarrhoea, when present, quickly stopped when feeding with the mixture of milk and broth was begun. In 6 out of the 9 cases a gratifying increase in weight became evident; of the remaining 3, 1 child during the time of the diet suffered from an influenza-like feverish attack, a second did not take enough food, a third soon after the beginning of the treatment began to have dry, crumbling stools. The course, in the 5 cases which remained longer under treatment, was very favourable: immediately or soon after the beginning of treatment the weight in each case began to go up, and the further increase left nothing to be desired. Although the whole number of cases is not large and they all belong to the hospital class, yet the results were so clear that the author finds himself justified in considering that the symptoms due to a flour-food diet form an indication for the milk and meat-broth diet. Further information is needed as to how long the diet should be persisted in. Two of the cases appeared to indicate that the milk and broth mixture was only of value for a few days, and that some children could after that return to milk and flour mixtures.

165. Injections of Morphine in Acute Laryngeal Spasm in Infants.

SARGNON, BARLATIER, and MASTIER (*Ann. de Méd. et Chir.*, February 15th, 1909) quote Lesage and Clérét, who have had favourable results from the following minimum doses in cases of laryngeal spasm where operative interference seemed urgent. Respiratory difficulty vanished at once, and was, as a rule, followed by six or seven hours' peaceful sleep. There were no bad after-effects, and the writers now tend to give larger doses. Those reported are: $\frac{1}{2}$ c.cm. of $\frac{1}{100}$ per cent. solution of morphine hydrochlorate in the first year of life, $\frac{1}{2}$ c.cm. in the second year, and 1 c.cm. in the third. The same treatment has been carried out where intubation had been required, shortening the period during which the instrument was necessary and preventing renewed intubation where removal had been followed by an exacerbation of the symptoms. Treboullet and G. Bozé publish 13 cases of croup treated by injections varying from $\frac{1}{2}$ to $\frac{1}{4}$ cg. with the following results: Two deaths in children of 18 and 19 months, where there had been intubations and tracheotomy. One uncertain case; recovery following intubation and injections. Ten successes in children from 21 months to 10 years. Difficulty of breathing vanished in twelve hours at latest. These authors administered as much as $\frac{1}{2}$ cg. in children of 6 months without ill-effects, and obtained good results from the same doses in whooping-cough uncomplicated by bronchopneumonia. They counsel strict attention to diet and frequent examination of the urine. Sargnon, Barlatier, and Mastier publish the following observation of their own after dwelling on the bad results of tracheotomy—from which Rankin gives a mortality of 95 per cent. in children under 1 year and 75 per cent. in those under 2—urging the desirability of trying any safe form of medication tending to do away with the necessity of operative interference; they, however, emphasize the fact that the value of this treatment consists in its application to pure cases of spasm, and that it is contraindicated where there is mechanical obstruction, or where spasm is complicated by bronchopneumonia: A child, aged 14 months, had slight cough; no dyspnoea; temperature 39.9° in the morning, rise of temperature to 40.5° at night; pulse-rate, 108; no other symptoms. Intense difficulty in breathing the following night; rapid respiration-rate; no chest symptoms;

no false membranes. Preparations were made for intubation and tracheotomy, the diagnosis being non-diphtheritic laryngitis. A precautionary dose of serum was administered (10 c.cm.), followed by that of $\frac{1}{2}$ c.cm. of a $\frac{1}{10}$ per cent. solution of morphine. The patient settled in about ten minutes and slept for six hours. Uninterrupted recovery ensued. Cultures revealed staphylococci and streptococci, but no Klebs-Loeffler bacilli.

PATHOLOGY.

166. The Toxicology of Nickel Carbonyl.

H. W. ARMIT (*Journ. of Hygiene*, November, 1908) continues his investigation of nickel carbonyl poisoning by experimentation on rabbits, cats, and other laboratory animals, and arrives at the following conclusions. Nickel carbonyl poisoning is a particular instance of nickel poisoning. The lethal dose of nickel varies according to the method of application. When given subcutaneously the physical condition of the compound influences the rate of absorption, and therefore relatively large quantities may be required; in rabbits the lethal dose is about $\frac{7}{8}$ mg. per kilo of body weight, and in cats it is about 12½ mg. per kilo. When applied intraperitoneally the absorbing surface is considerably larger, and consequently the minimal fatal dose is smaller, being less than 7 mg. for a rabbit. When applied in the form of nickel carbonyl vapour the conditions are still more favourable for rapid absorption, the fatal dose for rabbits being from 3 to 4 mg. per kilo, and for cats about 8½ mg. Nickel carbonyl is dissociated in the lungs, and a nickel compound, probably the hydrated subcarbonate, is deposited. The nickel is dissolved from the respiratory surface by the tissue fluids, and is then taken up by the blood and enters into complex combination with some constituent of the body. Some of the nickel finds its way directly through the lymphatic channels into the bronchial glands. The brain, the adrenals, and the lungs appear to exercise a selective absorption of the nickel which is brought in contact with them, but the poison only stays for a short time in these organs. The specific pathological changes produced are primarily a degeneration of the endothelial cells of the capillary vessels, and it is possible that some further primary action is exercised on the ganglion cells in the brain and on the parenchyma cells of the adrenals. As the result of fatty degeneration of the vessel walls, haemorrhages follow, and secondary changes result from the effects of the haemorrhages. The nickel is excreted by the kidneys and intestines. The method of poisoning with iron carbonyl is similar to that of nickel poisoning, but the amount necessary to kill in the former case is larger. Iron acts in a similar manner to nickel on the walls of capillary vessels, but the author has obtained no evidence of selection by any special tissues. Cobalt has a toxicological action which is identical with that of nickel, but the lethal dose is higher, though smaller than the lethal dose of iron. After the inhalation of a quantity of nickel or iron carbonyl greater than the minimum required to kill, no form of treatment was found to avert death.

167. Catalysis and Oxydasis in Normal and Carcinomatous Liver.

BLUMENTHAL and BRAHM (*Méd. Klin.*, January 3rd, 1909) take normal human liver, as fresh as possible, and equally fresh carcinomatous liver, and let them undergo autodigestion with chloroform water in an incubator at 37° C. The autodigestion mixtures are pipetted off after a fixed time, and the amount of oxygen set free from hydrogen peroxide—that is, the action of catalysis and oxydasis in the autodigested mixtures is tested quantitatively, as follows: A measured amount of H_2O_2 is added in excess to the autodigested liquid, removed with a pipette, and when the development of gas has quite ceased, the amount of unaltered H_2O_2 is determined by titration with a $\frac{1}{10}$ normal solution of $K.MnO_4$, dilute H_2SO_4 being added. Fresh carcinoma of the liver sets free a considerable amount of O from H_2O_2 , but always decidedly less than normal liver. The amount of O set free decreases rapidly in carcinoma, while in normal liver it remains constant for many weeks. This corresponds with the rapid decrease in oxygen-liberating ferment action in the case of carcinomatous as opposed to healthy liver. Pieces of liver, macroscopically normal, were further examined in this way, and figures obtained which lay between those for normal and carcinomatous liver: this shows the influence of the diseased parts on the healthy by means of the ferment in question.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

169.

The Parathyroid and Tetany.

UNDER the title of "the parathyroid gland and its relation to the pathogenesis of tetany," Bruno Glaserfeld sums up our knowledge with regard to the physiology of the parathyroid and to the symptoms produced by disturbances of its functions (*Berl. klin. Woch.*, January 18th, 1909). Sandström first described the parathyroid gland in 1880. Anatomically, the gland has been found to vary in size, shape, and position not inconsiderably. In man it is usually placed directly touching the posterior surface of the thyroid gland, toward the lower and median border of the lateral lobes, and therefore lies in close proximity with the oesophagus and trachea. It is usually rounded or flattened, and resembles a lymphatic gland macroscopically. Its colour is brownish-red. More than one pair of parathyroid glands have not yet been seen in man, but occasionally only one gland has been found. Apart from this gland, an internal epithelial body situated in the structure of the thyroid gland has been seen in some animals, but it appears to be doubtful whether this occurs in man as a normal condition. Histologically, the glands consist of epithelial cells forming a compact contiguous mass, without reticulum, merely separated by septa carrying the vessels, but at times well-marked connective tissue septa are met with. The cells are partly large epithelial cells, with well-developed nuclei, which stain intensely, and almost structureless protoplasm, and partly large epithelial cells with small nuclei, very sharp edges, and granular, well-differentiated protoplasm. The idea which Sandström first expressed that the parathyroids were embryonal thyroid glands—has been disproved, and it is now almost certain that these structures are independent, and arise from the third and fourth branchial arches. With regard to the pathology of these glands, Schmorl has described amyloid degeneration and miliary tubercles affecting them. Haemorrhages in the glands as well as hyperplasia have been described in connexion with tetany, while necrosis, tumour, and other changes have been met with on rare occasions. The experimental removal of the parathyroids in animals leads to the development of tetany. If some parathyroid tissue is left, the tetanic convulsions are mild, and only last for a short time, while recovery soon takes place. Some observers have attempted to dispute this, but it may be stated that the dependence of tetany on operative disturbance of the parathyroids has been proved. It is wrong to speak of a *tetania strumipriva*; *tetania parathyropriva* is the proper term. The parathyroid gland is absolutely necessary for life, and no animal has been kept alive after the complete removal of this organ. Its functions may be said to regulate the proper balance of the motor nerve function. Glaserfeld inquires into the question whether tetany is always produced by some lesion of the parathyroid gland. Tetany is known to arise, apart from operative removal of goitre, in certain occupations, in acute infectious diseases, in pregnancy, in chronic gastric affections, and in early childhood. The idea that these forms are primarily due to an insufficiency of the gland is accepted by many astute observers. Experimentally the tetany of pregnancy alone has been dealt with. Thaler has removed the parathyroids of a rat, leaving one-half of one gland intact. No symptoms were seen, but tetany occurred as soon as the animal became pregnant. This experiment has been repeated in various forms with similar results, so that it may be accepted that pregnancy tetany is due to insufficiency of the gland. Tetany of childhood cannot be experimentally studied, but it has been found in a large proportion of the autopsies that haemorrhages in the parathyroids was present. With regard to the other forms, one very significant fact is emphasized. Tropic disturbances, especially affecting the skin, nails, etc., are frequently met with in these cases, and similar trophic disturbances were described by Erdheim in experimental tetany. The author considers, therefore, that it is justifiable to regard human tetany as a condition which stands in relationship with affections of the parathyroid. So far no defined tetany toxin has been discovered, and, although various theories with regard to the way in which tetany is produced have been brought forward, no actual evidence in this direction is available. Tetany has been treated by means of animal parathyroid gland or some preparation of

the same. Löwenthal, Wiebrecht, and MacCallum report on favourable results, while in tetany of childhood no benefit has yet been obtained.

169. The Sign of "Tapotage" in Pulmonary Phthisis.

IN 1904 Erni described a symptom which frequently exists in pulmonary tuberculosis. In certain cases percussion—above all in the subclavicular region—will excite immediate cough and expectoration. Molle (*Lyon Méd.*, February 7th, 1909) has observed this sign of tapotage in several cases, and disagrees with Erni's opinion that the sign is distinctive of a subjacent pulmonary cavity. He found it in one case of early tuberculous infiltration in which cavitation was extremely improbable, and was not shown by any other sign. On the other hand, "tapotage" is frequently absent where a cavity undoubtedly exists. Nevertheless, the sign is by no means without diagnostic value. Molle has found that it is associated with the neuro-muscular hemiparesis, such as Weil and Jaquet have described in pulmonary tuberculosis; it presents the same characteristic variability and inconstancy, and is due to a hyperaesthesia of the subjacent pulmonary parenchyma, the area of which is the same as the area of hyperaesthesia of the relatively superficial structures such as the muscles and nerves. The cough is, then, reflex rather than of mechanical causation.

170. Diagnosis of the Functional Capacity of the Kidney.

ZAGARI (*Rif. Med.*, February 22nd, 1909) points out that it is often more important to know whether a kidney is functioning adequately than to know whether it is diseased. A diseased kidney, like a diseased heart, may still perform its functions sufficiently well so as to be of less danger than a kidney less diseased but functionally compromised. Hence the importance of tests which may be relied on to indicate faulty function on the part of the kidney at early stages. The author has made trial of most of the recognized methods for his purpose, and briefly gives his experience. On the whole, he believes most may be learnt from a careful examination of the way in which chloride of sodium is eliminated. If the kidney is not working well there is almost certainly some retardation, or even retention, of the salt. In a healthy or compensated kidney salt is readily eliminated. In a definitely diseased kidney less than a quarter of the salt is eliminated, and this proportion holds good relatively in milder degrees of disease. In a healthy kidney the salt (meaning in every case a small excess over the normal diet) is quickly eliminated within the first hour, and the earlier the time the quicker the rate of elimination; all this is altered and retarded in kidneys that are not working well. This retarded elimination in diseased kidneys is a valuable indication. The author is alive to the fact that it may not be safe to test the total functional capacity of a kidney by the elimination of one particular solid constituent of the urine, but of the methods tried by him or suggested by others he has found his practically the most useful.

SURGERY.

171. Mobilization of Left Colon in Removal of Cancer of the Sigmoid Flexure and Upper Part of the Rectum.

JAVAILLON and CHALIER (*Lyon Chir.*, Tome I, No. 4, 1909) describe at length a complicated operation which they have practised on the cadaver, with the expectation that in its application to the living subject it may enable the surgeon to avoid some difficulties, and also the inconvenient result with regard to a false anus, in the removal of large and adherent cancer of the sigmoid flexure and the upper part of the rectum. It has been found by the authors that it is anatomically possible to drag down through a perineal wound the whole of the sigmoid flexure, and to attach the lower part of the descending colon to the margin of the skin wound in this region, after having mobilized the whole of this portion of the intestine. In the first and abdominal stage of this operation the descending colon, together with the splenic

and sigmoid flexures, is, after exposure by left lateral laparotomy, rendered free and floating like small intestine by careful section of the suspensory ligaments of the splenic flexure, of the peritoneal investment along the outer margin of the descending colon, and of the mesenteric attachment of the sigmoid flexure. In the second stage, following complete closure of the abdominal wound, the coccyx is resected and the rectum set free by the usual perineal operation. The sigmoid flexure, and, indeed, most of the descending colon, can now be drawn into the wound. After removal of the growth the lower end of the divided colon can be sutured to the margin of the anus or to that of the rectum, if the lower portion of the gut can be saved. The performance of this operation may, the authors believe, be justified from a physiological point of view by the following considerations: It is a fact that at the present time very extensive resection, and even complete occlusion, of the large intestine may be practised without causing any serious inconvenience. In the second place, the different manœuvres of loosening the attachments of the splenic flexure and the descending portion of the colon are not accompanied by any vascular division capable of impairing the vitality of this portion of the intestine. Perineal displacement of the descending colon does not exert on the blood vessels of this portion of intestine such a degree of traction as might interfere with or even seriously compromise its nutrition. Finally, steps taken before closing the abdomen to fix by sutures the loose and depressed portion of colon would serve to prevent any flexure or faulty position that might ultimately cause any mechanical troubles of the intestine and symptoms of obstruction. This proposed method of dealing with recto-sigmoid cancer is not likely, it is held, to be more severe than the combined abdominal and perineal operation now usually practised in such cases, and it has the great advantage over the latter of saving the patient from the infirmity of an artificial anus in the groin.

172. Endoscopy in Cicatricial Stricture of Oesophagus.

GUISEZ (*Bull. de la Soc. de l'Internat. des Hôpitaux de Paris*, No. 9, 1908) reports very favourably of oesophagoscopy as an aid to the direct treatment of cicatricial stenosis of the oesophagus. By exposing to view the seat of obstruction the surgeon is enabled to deal with any diverticulum that may exist, to find the entrance to the stricture, which has often an eccentric situation, and to treat with good prospects of success a narrow constriction that could not have been dealt with by ordinary means. A very fine bougie having been passed through the stricture under oesophagoscopic control, the further treatment in the author's practice consists, according to the nature and extent of the lesion, either in gradual dilatation, in section of the stricture, or in dilatation by electrolysis. The author describes the results of his treatment in 31 cases of narrow and difficult oesophageal stricture, in 6 of which gastrostomy had been performed. In 25 cases he has succeeded in restoring the calibre of the oesophagus, and in rendering the patients capable of normal or almost normal alimentation. In the cases in which the treatment failed the stenosis was complete, or the author was unable to find the very minute entrance to the stricture. The results obtained in the successful cases are regarded as complete and durable, several patients having passed over intervals of from two to three years without presenting any signs of relapse. The prognosis is better in cases of recent stricture than in those of stenosis of long duration in which the cicatricial tissue is tough and fibrous. The most favourable cases, it is pointed out, are those of short and valvular stricture. Multiplicity of the strictures is not an obstacle to endoscopy, provided each be dilated successively. Long strictures with longitudinal infiltration of the oesophageal walls are very difficult to traverse, and, even if permeable, necessitate for their treatment frequent endoscopic sittings. The author holds that his results have been very satisfactory, as they indicate that a cure can be effected in 80 per cent. of cases in which gastrostomy is the only alternative.

173. Iodoform Amblyopia.

M. ROCHON-DUVIGNEAUD brought a case before the Paris Ophthalmological Society (*Recueil d'Ophthal.*, November, 1903) in which symptoms of retrolubular neuritis followed the injection of 20 c.cm. of glycerine emulsion of iodoform into a psoas abscess. Eight or ten days later the patient began to taste iodoform and have a smell of it in his nose. He had a heavy feeling in his head, but no vomiting or vertigo. Thirty-seven days later amblyopia came on.

A double optic neuritis was present, with later a central scotoma for green and red. There was also some peripheral contraction of the fields for these colours. Valude and Terson have published similar results from saturation with iodoform. Both these cases resulted in permanent partial optic atrophy. Sauveau, during the discussion which followed, stated that he had had a similar case in his practice.

OBSTETRICS.

174. The Induction of Premature Labour.

In order to determine which method is the best for inducing premature labour, Otto von Herff (*Muench. med. Woch.*, December 15th, 1908) first considers what results have been obtained by hebstectomy at full time; 664 cases published were found to be available for this purpose. Of these, 4.9 per cent. of the mothers and 9.6 per cent. of the children died; and even when the mothers recovered it was found that a considerable proportion of those examined at a later date showed serious disturbances, which could be ascribed to the operation. In comparing the conditions applying to induced labour, he states that the maternal mortality is less than 1 per cent., although that of the children is 20 per cent. Bumm has succeeded in diminishing the infantile mortality to 13.2 per cent., but at the same time maternal mortality rose to 1.9 per cent. He believes that hebstectomy must disappear from the list of operations of selection, and only be retained for those cases of urgent necessity in which no doubt exists that the method is sufficient for the case. Every general practitioner should be able to induce premature labour with safety, but, inasmuch as the unfavourable conditions of the private house with regard to antisepsis and asepsis as compared with the clinic might affect his results, it is necessary to introduce the simplest method of inducing labour, in order to keep the maternal mortality as low as possible. The simplest method, undoubtedly, is rupture of the membranes. It is rapidly performed; the armamentarium required is limited to a suitable membrane "Sprengrer" (the ordinary pointed probe may be insufficient), and it never fails. As a rule the pains set in after from six to twelve hours, while occasionally a somewhat longer interval may intervene. The patient is kept in bed during this period, and in some cases vaginal douches should be given. No further interference is required, so that the risk of infection becomes almost nil. Von Herff gives the statistical results obtained in his clinic by inducing labour prematurely by rupturing the membranes. Among 12,400 births, 5.7 per cent. were so induced. The pain set in on an average eighteen hours after the rupture. The birth itself usually occupied a shorter period than at full time. Only in 3.9 per cent. of the cases were the pains "too weak." Part-partum haemorrhages were not more frequent than when the birth took place spontaneously at full time. The placenta had to be artificially assisted in rather more cases than is usual, but this is probably due to the fact that the induction of premature labour was performed for contracted pelvis. Prolapse of the cord was met with nine times. The infantile mortality was 2.8 per cent. Turning to the condition of pelvis for which premature labour had to be induced, he finds that in 4 cases osteomalacia was present, in 3 cases there was a "filter" shaped pelvis, and in 1 case each there was a transversely contracted, a coxalgic obliquely, and a kyphotic obliquely contracted pelvis. In all the rest there were simple flattened, general contracted, or general irregular contracted pelvis. The conjugate measured from $7\frac{1}{2}$ cm. to $8\frac{1}{2}$ cm. in 73 per cent. of the cases. More important was the estimation of the actual size of the inside of the pelvis in relation to the fetal head. The labour was induced at or after the thirty-fifth week whenever this was possible. Out of 100 such births undertaken by the author at the lying-in hospital one woman died; all the other mothers recovered. Of the 100 children of these mothers, 85 were born alive, while 5 died during the early days of their lives. The remaining 80, however, left the hospital in good condition and with an excellent prospect of life. He compares these results with the results obtained in contracted pelvis when the labour was allowed to go to full time; 68 mothers brought their babies into the world without further help, but 30 per cent. of these babies were lost. Forceps were used in 30 per cent. of the cases, with an infantile mortality of 36 per cent.; version yielded an infantile mortality of 76 per cent., while all the operative-born children taken together included 55 per cent. dead children. The whole series showed a loss of infant life to the extent of 45 per cent. This, he claims, speaks

most eloquently in favour of inducing premature labour by rupturing the membranes according to Scheel, at the proper time, for contracted pelvis.

GYNAECOLOGY.

175.

Laparo-colpohysterotomy.

A. DÜHRSSSEN records a new method of dealing with labour complicated by contracted pelvis (*Berl. klin. Woch.*, February 1st, 1909). The means hitherto at our disposal in such cases have been summed up by Hegar as boring a hole in the head of the fetus, or sitting up the mother's belly, both of which he considers to be inhuman and rough. Sawing through a pelvic bone in the mother is not less objectionable, and should not be performed. Hegar further considers that the classical gynaecological operations are forceps, version, and Dührssen's vaginal Caesarean section. The author agrees that symphysiotomy and pubiotomy will disappear from the list, but he thinks that a new operation—which his assistant, Solms, has devised—will replace it. This is a combination of Ritgen's gastro-elytrotomy and vaginal Caesarean section. This operation was performed on a 3-para, whose conjugata vera measured 10 cm.—that is, nearly 4 in. She had lost her two babies during the former births. At the end of pregnancy, after dilating for one hour with a bag, an incision was made above Poupart's ligament on the left side, through the abdominal muscles and fascia transversalis. The bladder was then pushed forward, and the peritoneum was separated from the uterus and pushed upwards. In this way the lower uterine segment was exposed. Very little haemorrhage was experienced, as the inferior epigastric artery was tied in two situations and divided between the ligatures. The next step consisted in incising the anterior vaginal and cervical wall in the manner of anterior colpohysterotomy. The child was lying in the first vertex position. Forceps were applied through the flank wound, and the child was easily delivered through the two openings—that is, that in the vagina and cervix and that in the flank—alive and well. The placenta was expressed *per vias naturales*. Then the vaginal-cervical wound was closed through the vagina, and the flank wound was suture in several layers. The wounds healed by first intention. The uterus underwent a normal involution, and was found three weeks after to be anteфлекed, as against a slight retroflexion which was present early in the pregnancy. In discussing the operation, Dührssen states that it was actually extraperitoneal, although the medial incisions do not permit of extraperitoneal access to the uterus. The peritoneum is considerably less firmly fixed laterally than it is in the middle line. No raising of the pelvis is required, so that the danger of air embolus is not present. He mentions that it can be undertaken on any table, and does not need a special operating table with mechanism for tilting the patient upside down. An excellent drainage is provided by the vaginal hysterotomy. Since many cases of contracted pelvis are not seen by the surgeon until attempts have been made to deliver, and since these attempts include the introduction of the faultily disinfected hand into the genital canal, a considerable proportion of the cases will not be free from some infection, and for this reason good drainage is of paramount importance. He further discusses in some detail the advantages of his operation over Frank-Sellheim's Caesarean section. E. Solms adds a short description of the operation itself, and deals with the technique of the same.

THERAPEUTICS.

176.

Karell's Milk Cure.

L. ROEMHELD (*Monatsschr. f. d. physikal.-diätetischen Heilmethoden*, January, 1909) describes Karell's milk cure, with its modifications and the widened indications for its use. Karell in 1865 reported on 200 cases in which he had employed a milk cure for the purpose of unloading the system generally and especially the circulatory organs; his method was to administer the milk at first three or four times a day, later at four-hourly intervals, the quantity allowed being half or a whole coffee-cupful of skim milk to be taken in sips. Recently Jacob has given a report of Karell's cure as systematically employed by Lenhart during fifteen years in the treatment of chronic bronchitis, of heart disease with failure of compensation, and of obesity with an overtaxed heart. Under Lenhart the patient was absolutely at rest in bed, and for the first five to seven days of treatment received four times a day 200 c.cm. of milk. During the next two to six days an egg,

Zwieback, and later minced meat and vegetables, etc., were added, so that after about twelve days there was a return to a full mixed diet. During the treatment special attention was given to securing a regular evacuation of the bowels. In cases where the heart had sufficient reserve power the effect of the treatment was seen in greatly increased diuresis, in loss of weight, and in re-establishment of cardiac compensation; in some cases it was advisable to administer digitalis during the period. Where the cure failed it was, as a rule, a sign of advanced degeneration of the cardiac muscle. Roemheld and also Moritz, without knowledge of Karell's cure, have recently recommended milk cures for obesity. Roemheld arrived at the treatment from a consideration of the diuretic action of a salt-free diet. He puts his patients on to milk for two or more days of each week throughout the whole cure; on "milk days" he allows 1,000 to 1,200 c.cm. of milk; on other days a mixed diet such as to afford two-fifths to three-fifths of the necessary calories. The diet is especially suited for patients suffering from heart disease, gout, or nephritis. The "milk days" are especially effective at the beginning of a cure where there is failure of compensation. At the end of a cure a patient may keep his weight down for an indefinite time if he will continue to have two of the "milk days" each week. Moritz goes further than Roemheld, and recommends a pure milk cure to be continued for weeks. On his system the amount of milk required is calculated on the normal weight of the patient, and varies from $1\frac{1}{2}$ to 2½ litres a day. Moritz claims that the cure is the simplest one for obesity: the patient loses on an average 200 grams of weight a day without suffering from thirst or great hunger. As a rule the patient can go about his work during the cure, but he must be under medical observation. A consideration of Karell's original cure suggests that its good effects are due, first, to the sparing of the heart as a result of underfeeding and rest, and, secondly, to the diuretic action of the milk with its small percentage of NaCl. Roemheld would therefore recommend the original cure in cases of failure of compensation, whether as a result of heart or kidney lesion or of chronic bronchitis. In cases of obesity he would combine his own and Moritz's cure, beginning with a pure milk cure, and later, in order to avoid monotony, going on to a mixed diet of lower than normal caloric value with the systematic use of certain "milk days" each week; when the cure is ended he would still recommend the "milk days" as a means of making the results of the cure more lasting. Emphasis is laid on the fact that any cure for obesity which involves underfeeding should be carried out under medical supervision and should be adapted to the individual case.

177.

Veronal Sodium.

H. WINTERNITZ points out that Meick and Bayer, who manufacture veronal, have brought out a sodium diethylbarbiturate, which they quite properly call "sodium veronal," while Schering produces the same combination under the artificial name of *medinal* (*Munch. med. Woch.*, December 15th, 1908). This double patenting of the same substance reveals a peculiarity of the German patent law. Sodium veronal is far more soluble than is veronal, 1 part of the former being soluble in 5 parts of cold water, while 1 part of the latter is only dissolved in 145 parts of cold water. The author states that sodium veronal is split up in the acid contents of the stomach into veronal, but on reaching the alkaline intestines the sodium salt is again formed. The only advantage of the sodium salt over ordinary veronal is therefore its solubility, but since the stomach usually contains sufficient fluid to dissolve a dose of veronal, the rapidity of action is usually the same in both cases. When administered per rectum in the form of suppositories, the sodium salt has advantages over veronal, but the action is not reliable. Applied subcutaneously or intramuscularly, sodium veronal is rapidly absorbed. The author has given it in 10 per cent. solution, of which he injected from 5 c.cm. to 10 c.cm. He was unable to try the hypnotic effect in cases of excitement or intractable sleeplessness, but in cases of sleeplessness following sciatica and intercostal neuralgia, he gave both forms of injection, and was surprised to find that the hypnotic action was very slight. Sleep only set in after from three to four hours, was not deep, and only lasted for a short time. When applied intramuscularly during the daytime, no hypnotic effect appeared at all; $\frac{1}{2}$ gram of sodium veronal given internally acted more powerfully in inducing sleep than 1 gram given subcutaneously. On the other hand, in neuralgic pains, the intramuscular injections acted exceedingly well in relieving the pain. This he was able to test in six cases of sciatica and one of alcoholic intercostal neuralgia. He

points out, however, that we possess local anaesthetics which are more powerful and better adapted to local pain-stilling. He concludes by relating the rough data of some experiments which, in his opinion, show that the respiratory centre requires a considerably more powerful stimulation to produce increased work during sleep (including hypnotic sleep) than in the waking condition. The diminution of the respiratory activity during sleep is produced by a diminution or cessation of sensory and psychic stimuli on the centre as well as by a diminution of the excitability of the respiratory centre. This applies to sleep induced by veronal, amylene hydrate, chloral hydrate, etc., as well as to natural sleep.

178.

Neuroprin.

ROASENDA (*Gazz. degli Osped.*, No. 21. February, 1909) has noticed good results in the treatment of certain convulsive types of nervous disease by means of neuroprin, which is an extract of nervous tissue, and has been compared to digitalis in as far as its tonic action on the nervous system is concerned—as digitalis is a cardiac tonic, so neuroprin is a specific nerve tonic. The author has used the drug with success in epileptics, in epileptoid attacks, in neurasthenia (especially when marked by insomnia, mental and physical excitability followed by speedy exhaustion), in Graves's disease, and in one case of paralysis agitans. From his experience he believes that neuroprin is a good nerve sedative and tonic, and may in certain cases prove a useful substitute for the bromides and other cortical sedatives. He has not observed any ill-effects from its use.

179.

Atoxylate of Mercury in Spirochaetal Diseases.

UHLÉNTHUTH AND MANTEUFEL (*Mediz. Klinik*, October 25th, 1908) have found the mercury salt of p-amido-phenylarsenic acid, or mercury atoxylate, more efficacious than either mercury or atoxyl alone in the treatment of syphilis. (1) Mercury atoxylate, given in a single injection in doses well below the toxic, kills fowl spirochaetes in the organism with certainty. A single intramuscular injection affords sure protection against subsequent infection by fowl spirochaetes, even when this occurs only one or two days afterwards. (2) In the treatment of syphilis in rabbits, mercury atoxylate has shown itself superior to all other mercury and atoxyl preparations. A single injection in all Uhlenhuth's and Mantefuel's cases caused the disappearance of severe corneal syphilis in from five to six days. So far relapses have not been observed. (3) The preparation acts also on the spirochaetes in the recurrent infection of rats. The slight resistance of rats towards the preparation makes a true judgement difficult. The application of this preparation to monkeys and human beings will further elucidate its efficacy. (4) In trypanosome infections (dourine, sleeping sickness) the preparation has a good effect. The introduction of mercury into the atoxyl group seems to raise in a very marked manner its spirochaetal-destroying property. (5) In a test tube the preparation is distinguished from atoxyl by the fact that though it is with difficulty soluble in water, it rapidly kills trypanosomes and spirochaetes. The surprising results in rabbit syphilis induced the writers to recommend mercury atoxylate in the local and general treatment of human syphilis; they hope by this preparation to simplify and accelerate treatment, and suitable trials are already being carried out.

PATHOLOGY.

180.

The Development of Sarcoma after Transplantation of a Carcinoma.

BASHFORD, MURRAY, AND HAALAND recently described the development of a sarcomatous tumour out of carcinoma of a white mouse. Ehrlich and Apolant have also been able to describe this phenomenon in their mice. Loeb has been able to observe a similar alteration in the type of growth, and reports briefly some of the more important points in connexion with this case, while he reserves the full description together with the microscopical appearances for a future publication (*Deut. med. Woch.*, January 1st, 1908). The case was one of an adeno-carcinoma of a Japanese mouse, thus differing from the other cases which affected white mice. The primary tumour was characterized by the plentiful presence of vacuole cells. The primary tumour was situated in the submaxillary gland. At first there was no reason for regarding the tumour as a mixed tumour, and it was only after the successive inoculation that the type changed to that of a sarcoma. The sarcomatous type appeared first in the second generation,

which proves that the change was not due to a stimulus which arose after the repeated transplantations or to an increase of virulence obtained by several passages. The sarcomatous element was found in all the replanted tumours which were obtained from the first sarcomatous tumour. It therefore appears that the sarcoma formation does not depend on a constitutional peculiarity of the animal into which the tumour is grafted, nor does it depend on any accidental circumstance in connexion with the transplantation. Loeb shows that such a transformation does not require a special virulence of the original carcinoma; indeed, he finds that considerable variations in the inoculability of the tumours have been met with. In his series he obtained 100 per cent. of successful implantations, as against the 50 per cent. which Bashford and his colleagues obtained. He argues that the development of sarcoma depends on the overgrowth of the connective tissue of the animal into which the tumour is implanted. In support of this he states that in his cases, in the first generation, he found that the connective tissue of the implanted growth showed degeneration, while the epithelial elements proliferated. At the time strands of newly-formed connective tissue were seen which stood in direct connexion with the connective tissue of the host. Further, he found that the sarcomatous elements were situated at the periphery of the growths and not among the carcinoma nests. In some of the tumours of subsequent generations he found three types of growth: (1) Large sarcomatous growths situated apart from large carcinomatous growths in the same animal. (2) The sarcomatous tissue invaded the carcinomatous growth. (3) The growth was chiefly sarcomatous, but small nests of carcinoma were included in the tumour. He proceeds to describe certain changes which were met with in the structure of both elements. The chief changes in the carcinomatous portions consisted in the decrease and eventual disappearance of the vacuolated cells. As far as the sarcomatous elements were concerned, here again he found that the structure tended to become much more simple. At first there was a well-marked polymorphous character of the cells, but this was absent in subsequent generations. He found that while the first sarcomatous tumours tended to grow slowly, later on the transplanted tumours became more rapid in their growth, and, speaking generally, he states that quick-growing recurrent sarcomatous tumours were richer in cells than the slow-growing primary sarcoma. While he realizes that one is not in a position to explain the occurrence of sarcomatous elements after transplantation of carcinoma, he suggests that it is possible that some micro-organisms may be transferred from the epithelial cells to the connective cells. This theory would not clash with the finds of the other workers, but it must be understood that so far it is a mere hypothesis.

181.

Ichthyosis Fetalis.

COSTON (*Amer. Journ. Obstet.*, October, 1908) has published a report of another case of this disease, issued almost at the same time as Henneberg's paper in the *Ann. de Gynéc. et d'Obstét.*, September, 1908, with a good synopsis of earlier literature on the subject. In Coston's case the parents were a healthy country couple, the father aged 21, the mother 17, a Birmingham, Alabama, and all their antecedents and surroundings were satisfactory. Pregnancy speedily followed marriage. In the fifth month, when the patient was in perfect general health, and free from pain, a copious sero-sanguinolent discharge set in. The uterus was as big as it normally is in the seventh month; the fetal heart sounds were audible. He applied the tampon when an attack of flooding occurred. Seven days later labour came on, the breech presenting. Delivery was easy; the membranes were preserved intact until the breech was passing the vulva, when they ruptured spontaneously. A considerable portion of the placenta was torn off by the advance of the head. The fetus made feeble attempts to breathe. The placenta was of enormous dimensions, a fact which accounted for the great distension of the uterus, and for the haemorrhages; it extended from the fundus almost to the os internum, and measured 34 in. at its thickest part. Ichthyotic patches were detected on the surface of the umbilical cord, and on the amnion, which was of extreme thickness. During delivery, Coston noticed that the fetal limbs were rough and scaly. The fetus was covered from head to foot with characteristic rough scales, separated by fissures. The feet and hands were clubbed, and the nose and eyes deformed; there were no abnormalities in the ano-genital region. The thickening of the skin caused considerable rigidity of the trunk and limbs.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

182.

Cancer of the Stomach.

IN a clinical lecture, L. Kuttner (*Deut. med. Woch.*, January 14th, 1909) estimates the value of the various signs and symptoms associated with gastric carcinoma, and gives indications for making a correct diagnosis. In a large number of cases no difficulty in diagnosis presents itself; but cases not infrequently occur in which the opposite holds good. The fact that the only chance for the patient lies in an early diagnosis, during a time when operative treatment is still possible, renders it imperative for the general practitioner to be in a position either to make the diagnosis himself, or at all events to be suspicious of the nature of the disease, and therefore call on the specialist to confirm or refute his suspicions. While cancer of the stomach may give rise to no symptoms until a sudden hæmorrhage—either in the form of hæmatemesis or melaena—appears, the vast majority of cases show an insidious onset, and usually present the symptoms of acute dyspepsia or chronic catarrh of the stomach. The course at first may be extremely gradual, and the most marked symptom is the loss of appetite, together with a dislike to certain forms of food (usually meat). This symptom is important, although it must be recognized that some cancer patients retain their appetite until the end. Next Kuttner deals with the general predisposition. Age is an important factor, but young persons are not immune from the risk of the disease. He does not consider that heredity has anything to do with the disease, since this would only apply in about 6 to 7 per cent., and in so common a disease it is not surprising that several members of a few families should suffer from the same disease. Trauma, in his opinion, only plays an unimportant rôle in the etiology of the condition. Gastric ulcer is said to predispose to cancer. The same is said of troubles, excitement, mental depression. Kuttner regards these conditions as important in affecting the general state of nutrition, and suspicion of cancer should be aroused, especially when associated with severe anaemia. Intractable itching of the skin at times is noticed before a tumour is palpable. Multiple angiomata of the skin, on the other hand, have no diagnostic significance. Rarely the swelling of the left supraclavicular lymphatic glands may indicate a masked gastric cancer. Ill-smelling eructations and the vomiting of "coffee grounds" material are important symptoms. Fresh blood in the vomit need not indicate cancer. With regard to pain, he warns the practitioner against placing reliance on this symptom in forming a diagnosis. The palpation of a tumour naturally is of great importance, but in a large number of cases the tumour is not palpable, even when it has attained a considerable size. Visible peristaltic movements or antiperistaltic movements, including the so-called "stomach stiffening," are valuable diagnostic signs. He then turns to the examination of the secretion and motility of the stomach. Neither the absence of hydrochloric acid nor the presence of lactic acid are specific. When there is well-preserved motility, the HCl is usually diminished, lactic acid is not present, and neither lactic acid bacilli nor sarcinae are to be found. When the motility is insufficient, free HCl may be present, lactic acid is absent, but sarcinae are present, or the free HCl may be entirely absent, and there will be lactic acid fermentation. The presence of pus or purulent material in the empty stomach, provided that other sources of suppuration are sought for and excluded, is in favour of carcinoma. Particles of malignant tumour may be caught up in the eye of the stomach tube. The presence of amœbæ and flagellates in the mucus from the fasting organ is regarded as an early sign. The same applies to the discovery of a fluid containing considerable quantities of albumen. Left-sided pleurisy should always cause the practitioner to think of a gastric tumour. X rays may also prove valuable in the early diagnosis. Kuttner also deals with the treatment of inoperable carcinoma of the stomach. He disposes of Adamkiewicz's cancerin, Doyen's serum, radium, Keating-Hart's fulguration, etc., in a few words by stating that none of these methods can do any good. The results of trypsin treatment is summed up by recording that no cure has been effected. It thus appears that no curative treatment is available at present. Symptomatically the regulation of the diet, the improving of the appetite by means of

condurango bark and other drugs, the combating of vomiting by iced effervescent drinks, cocaine, chloroform, or morphine, and by washing the stomach out, the cautious treatment of diarrhoea and constipation, and a few other similar means may render the lot of the unfortunate sufferer tolerable. Nothing more can be done.

183. Human Contagion the Cause of Infantile Tuberculosis.

COMBY (*Arch. de Méd. des Enfants*, March, 1909) says the theory that tuberculosis is hereditary has been revived by some who hold that a predisposition is inherited. The disease has been observed to be transmitted to the fetus from a mother in an advanced stage of phthisis, by way of the placenta, but carefully compiled statistics have proved that this is very exceptional. The theory of an inherited predisposition is based on well-known facts wrongly interpreted. Predisposition is supposed to be recognized by certain signs—pallor, thinness, a narrow chest, enlarged glands. But these stigmata are not peculiar to children of tuberculous stock; they are found in others when they have been exposed to contagion. These stigmata are not signs of predisposition, but the results of infection; the children have the disease in a latent form, and have been contaminated at an early age. Thanks to the tuberculin test and Calmette's reaction it is now possible to prove that these children have the disease. Henceforth it can be said that the disease (with rare exceptions) and the predisposition are not inherited. If a child born of a phthisical mother, in the last stages, is at once removed from the danger of infection, that child will grow up strong and robust without developing tuberculosis; but if it remains with the infected family the contagion will prove fatal. In the same family some children react to tuberculin while others do not; those who react have been infected. The evidence of autopsies for the last fourteen years shows an increase in the number of tuberculous children in accordance with age. The disease nearly always makes its first appearance in the bronchial glands. In 216 autopsies in infants less than 3 months old there were 4 tuberculous; in 1,012 autopsies in infants under 2 years there were 253 tuberculous. The percentage works out thus: 43 per cent. between 1 and 2 years; under 1 year, 16 per cent.; between 3 and 6 months, 18 per cent.; between 6 and 12 months, 27 per cent.; after the second year the proportion reaches 67 per cent. Twenty-five years' experience has led Comby to the conclusion that in the majority of cases infantile tuberculosis is due to family contagion, and the bacillus is not introduced through the milk, but inhaled. The basis of this conclusion is the fact that there has been no diminution in the disease during the last twenty years, although every endeavour has been made to occlude infection from tuberculous milk by eliminating diseased cows, and by sterilizing the milk. The theory of human contagion is supported by the fact that tuberculous children are only seen in tuberculous families. Comby has never seen a case of infantile tuberculosis caused by milk. By all means let the milk be boiled, but this is useless unless means can be taken to protect the child from human contagion. The author has seen numbers of children die of tuberculous meningitis because they were not protected from the caresses of their diseased grandparents. As adjuvants in preventive treatment, Calmette's eye test and von Pirquet's skin test should be used; these are inoffensive and easy of application.

184.

Endemic Appendicitis.

SAXLUND (*Tidsskrift for den Norske Lægeforening*, No. 5, 1909) describes an endemic occurrence of appendicitis in a country district in Norway extending for about 3 to 4 kilometres. Sixteen cases had been personally treated from October, 1908, to February, 1909, and another 10 cases had been reported to him. They occurred mostly in young women about the age of 20, and the symptoms were mild. The majority had been operated on with good results. There was no evidence of case-to-case infection, but everything pointed to a common cause. Saxlund is inclined to attribute the occurrence to the ingestion of bad foodstuffs, and is having specimens of flour from several shops examined.

SURGERY.

185. Bilateral Ligature of the Internal Jugular Vein.

DUVAL, in a communication to the Société de Chirurgie de Paris (*Bull. et Mém.*, No. 7, 1909), directed attention to a case in which, in the course of a preliminary operation for removal of the glands of the neck, before dealing with a cancerous growth of the lower jaw, he found it necessary to resect on both sides the internal jugular vein. This sudden and simultaneous suppression of the two main channels for the return of blood from the brain, though immediately followed by intense congestion of the face and neck and by temporary arrest of breathing, did not lead to any fatal results or interfere with the subsequent satisfactory progress of the patient. In a report on this communication, Morestin referred to two fatal cases under his own observation, which show that while ligature of the internal jugular vein on one side of the neck is a harmless procedure, simultaneous occlusion of both these vessels, on the other hand, is a very serious step, which should never be taken except in case of absolute necessity. If such necessity be enforced by the depth and extent of the cancerous glands on both sides of the neck, the danger attending bilateral ligature may, it is suggested, be diminished or abolished by recourse to certain precautions or to some supplementary operation. The vein should be occluded very gently and gradually, and the venous occlusion be associated with ligature of the internal carotid or with temporary compression of the common carotid. It might be found practicable to effect an anastomosis between the internal and the external jugular or to reconstruct the former by vascular interposition.

186. Accidents in Hernia Operations.

ERDMANN (*Annals of Surgery*, February, 1909) points out that among the dangers to be avoided during an operation for the radical cure of hernia, especially by the Bassini method, are to be included, in addition to wounding of the vas deferens and bladder, wounding also of the bowel and the large blood vessels. An inquiry made among members of the New York Surgical Society elicited two instances of injury to the bowel, one in a large sliding or slipped hernia, in which the sigmoid was opened and subsequently sutured without any bad result. In the other the sigmoid had been evidently included in one of the deep sutures, as a faecal fistula developed soon after the operation, and persisted for several weeks, with eventual repair without secondary operation. Injuries to the femoral vessels in Bassini's operation on inguinal hernia are attributed to several important factors, among which are: (1) An anomalous distribution of the branches; (2) the needle; (3) the suture material as a contributory rather than a primary cause; (4) the method of passing the needle from above or from below; (5) too free exposure of the ligament. The arterial branch most likely to be wounded is the superficial epigastric. The author objects strongly to the use of a large curved needle with sharp edges, and holds that safety will be enhanced by substituting for Hagedorn's needle one that is round. Theoretically there is less danger in passing the needle from above downwards than from below upwards, but the author believes that if Poupart's ligament be grasped and held well upwards, it is not important how the needle is passed. The suture material should be soft and pliable, not stiff and wiry. With regard to the treatment of the injured vessel, if this be the femoral vein the surgeon can ligate laterally, or should the opening be too large for ligature, suturing can be practised more readily than in cases of arterial injury. If the artery be the wounded vessel, lateral ligature is out of the question, and either arteriorrhaphy or ligation above and below the wound must be practised.

187. Foreign Bodies in the Eye.

BEAUVOIS (*Revue d'Ophthalmologie*, September, 1908) points out that by far the largest number of workmen who seek compensation for loss of sight have suffered, not from violent accidents, but from small foreign bodies, such as a piece of steel, which have infected the cornea and caused ulcers, which have left large leucomata and consequent loss of useful vision. Nor is the cause an obscure one. When a mechanic gets a piece of steel or emery into his cornea he does not at once seek medical aid; in most factories there is a man, who may or may not have gone through an ambulance course, who proceeds to scrape out the offending body with a foul match or a filthy "magnetized penknife"; in these advanced days he even puts in a cocaine pellet. The patient then probably

goes back to work without even a protective bandage. If he use a lotion at all, it is probably not the usual boracic acid solution, but his own urine. Even when the workman seeks medical help it is generally only when the "works doctor" has failed to extract the foreign body, but has not failed to denude a large area of the cornea of its superficial epithelium; nor does he as a rule succeed in introducing the prescribed lotion or ointments into his eye. Beauvois thinks that in every case, even the most trivial, of abrasion of the cornea the eye should be bandaged for two days, and here all ophthalmic surgeons will agree with him. Especial attention must always be given to the lacrymal apparatus, for if there be pus in the lacrymal sac infection of the cornea is almost certain; but above all, when there is evidence of infection having already occurred, should the patient be admitted to a hospital, then alone is it certain that treatment will be carried out efficiently, and the simplest methods will often then give excellent results. If the patient refuse to undergo efficient treatment he should lose his compensation.

OBSTETRICS.

188. External Version.

IN spite of the ever-increasing extension of operative obstetrics which signals the midwifery of to-day, as it is taught in the large German clinics, A. Labhardt (*Muench. med. Woch.*, January 12th, 1909) states that von Herff realizes that simplicity is a golden rule in midwifery, and for this reason attempts to reduce the number of large operations to a minimum in the Basle clinic, and to employ and teach the simplest and least severe manipulations which can be regarded as safe. Among other simple methods, external version is resorted to where it can be applied with a fair chance of success. External version was recommended by Weigand over a hundred years ago. The author considers that internal version should never be attempted until external version has been fairly tried. There is no doubt at all that the danger of introducing the hand into the genital passages increases in direct proportion to the depth to which the hand is passed. Since internal version requires the operator to pass his hand far into the cavity of the uterus, the morbidity is relatively high. On the other hand, if version can be performed without passing the hand into the uterus at all, the morbidity must remain the same as that of normal births. The second advantage is the fact that an anaesthetic need not be given. He realizes that the danger of ether or chloroform in the hands of a practised anaesthetist is small, but in general practice the practitioner usually finds himself without assistance other than the midwife or "nurse," and he is forced to hand the chloroform bottle over to this unskilled individual. He points out that it is usually possible to convert a transverse presentation into a vertex presentation by means of external version alone. In a small number of cases this may prove impossible, and then the obstetrician can still perform podalic version by the external method. The last advantage which he mentions is that it is possible to turn by this method at all stages of labour, even when the os is still undilated. Against all these important advantages certain disadvantages must be mentioned. First of all, he states that unfortunately external version is not always possible. Next, there is a risk of prolapse of the cord or extremities of the fetus. This risk can be minimized by a proper impression of the head and by allowing the "waters" to drain slowly away. In 63 external versions he experienced a prolapse of the cord 3 times only. The indications for external version are found in all forms of transverse or oblique presentations. When a rapid delivery is required for the safety of mother's or child's life, cephalic version may not be undertaken, but podalic external version saves the insertion of the hand into the uterus. No anaesthetic is required, and all that is necessary is to bring down a leg after the child has been turned. External version is only admissible when the fetus can be clearly felt through the abdominal walls, and either end can be moved in any desired direction. A dead fetus cannot be turned from without, since it lacks the necessary rigidity. As a rule, the turning by this method depends on the intact condition of the membranes. It is, however, possible at times to turn after the membranes have ruptured and the liquor amnii has escaped. In a fair proportion of cases in which Labhardt has carried out this method hydramnion was present. An excessive supply of liquor tends toward the production of transverse presentation, and it is therefore especially when hydramnion is present that external version will be valuable. When the amount

of liquor is very excessive, it is wise to puncture the membranes and to allow some water to drain away, so that the fetus can be readily palpated and the risk of prolapse of the cord is diminished. Believing that a breech presentation is never an advantage in contracted pelvis, he cannot support the so-called prophylactic version. External cephalic version should always be attempted, even when the degree of contraction is comparatively severe. External cephalic version should, however, not be attempted when there are conditions existing which call for a rapid termination of the birth. These include eclampsia, dangerous illness of the mother, asphyxia of the child. In these conditions external podalic version should be performed, and a leg should be brought down later. With regard to the technique of the method, he has little new to add. When a fair attempt has failed, it may be necessary to have recourse to internal or combined version. In order to carry this out, anaesthesia is given, and a last attempt to turn externally should first be made with the patient asleep, the hand being protected with a sterile towel or glove. In all, from April, 1901, to October, 1908, 225 transverse presentations were dealt with. Of these a few were cases of placenta praevia, while some others came into the world by spontaneous evolution. The remaining 185 were left for external version, and in 35 per cent. of these the desired result was attained. The version was performed at all stages of the birth, from the time when the os was still closed until it was widely dilated. In the majority of the cases the membranes were punctured immediately after the version; in a few they were punctured before. In 7 cases the membranes ruptured spontaneously before the version, and in the same number they ruptured spontaneously after. In 3 cases it was necessary to rupture the membranes later. Forty-seven children were born as vertex presentations. Thirty-four of these were postero-anterior cases and 2 were stillborn, while 1 child born spontaneously as a face presentation also died. In all, 4 head presentation children died, while 3 out of 9 breech presentation cases were born dead.

GYNAECOLOGY.

189. The Gastric Secretion during Menstruation.

DEALING with the gastric functions during the menstrual period, I. M. Wolpe (*Dent. med. Woch.*, December 17th, 1908) briefly recalls the effects which have been noted on the mental state, the sight, the liver and secretion of bile, the intestine, peritoneum, metabolism generally, as well as on disturbances of a febrile nature, of the heart, etc.; on tuberculosis; and, lastly, on disturbances of the stomach. The author has studied the secretory and motor conditions of the stomach in 12 women in Ewald's clinic. The observations were made in the premenstrual period, during the menstruation, and also in the interval between two periods. He found that the difference exhibited during two periods in the same subject were so small that they need not be taken into account. Certain differences were noted between the conditions during the premenstrual and the menstrual period; but these again were slight, and do not indicate any marked characteristics of the two periods. His 12 patients include 5 who were suffering from nervous dyspepsia, with normal secretion and motility, 2 with anacidity, 2 with gastric ulcer and pronounced gastrosuccorhoea, 2 with hyperacidity, and 1 with subacid gastritis. These cases he compared with women whose digestive organs were normal. After describing the precautions which he took in order to avoid falling into error, he records his results. With regard to the secretion of gastric juice, he found that in all the conditions named the acidity is distinctly increased during menstruation, both when tested with an empty stomach and when tested after the trial breakfast. This menstrual hyperacidity consists of an increase in the secretion of hydrochloric acid, and also an increase in the total acidity. The acidity of the gastric secretion has apparently no connexion with the acidity during the interval, as was shown in cases of anacidity and hyperacidity; but the author supposes that it is produced by a reflexory action of the irritated genitals on the secretory nerves of the stomach. The amount of secretion during fasting was increased during menstruation, even in a case of gastrosuccorhoea. This was tested in 11 out of the 12 cases, in all of whom no motor insufficiency was present. With regard to the motor functions of the stomach, he found that the motility was distinctly diminished during menstruation. Normally, one hour after the trial breakfast there are 150 c.cm. of gastric contents. When this quantity is diminished there is evidence of weakness of the

stomach muscle. After testing by Mathieu-Remond's method, he concludes that a weakening of the stomach takes place during menstruation. These differences between the gastric functions during the intramenstrual and intermenstrual period cause him to warn physicians not to base a diagnosis of gastric disturbances on tests carried out during menstruation.

THERAPEUTICS.

190. Intraspinal Injections of Magnesium Sulphate in Chorea.

MARINESCO (*Sem. Méd.*, November 18th, 1908) has treated four cases of Sydenham's chorea by the above method, and describes the results obtained in these cases. The solution he employed for the injections was a 25 per cent. strength of crystallized sulphate of magnesia, which was prepared a short time before being used, and generally speaking he withdrew first a quantity of cerebro-spinal fluid equal to the quantity of sulphate of magnesia solution which he injected. The first case was a girl of 14, who had suffered from chronic symptoms for a short time only before admission to hospital on June 2nd, 1908. At first limited to the left side, the movements soon spread and became generalized. On July 5th 3½ c.cm. of the magnesium sulphate solution were injected into the spinal canal, and three-quarters of an hour later the intensity of the choreiform movements had greatly diminished. The following day the movements returned in the legs, and as they did not diminish another intraspinal injection (3 c.cm.) was given on July 30th. A half-hour later the patient complained of headache and formication in the limbs and back. The choreic movements had, however, diminished, although movements in the arms persisted. The next day the movements were reduced to a minimum, and by August 2nd they had completely disappeared. The second patient was a girl of 22, who had already suffered twice previously from chorea. Her present attack began July 11th, 1908, and on admission to hospital on July 18th she had all the signs of a generalized chorea. On July 18th 5 c.cm. of the magnesium sulphate solution were injected into the spinal canal. Following the injection her pulse rate, which previously had been 104 per minute, fell to 68, and one and a half hours later she became numb in the lower extremities, and could not move these, and these no longer showed choreic movements. A few hours later the patient slept, and it was then seen that her respiration rate was 34 and her pulse rate 106 to the minute, and her temperature was slightly raised. Three days later the numbness had disappeared, as had also the choreic movements. The third case was a girl of 15, who for about two months had had choreiform movements, and on admission to hospital on August 13th, 1908, these were seen to be very severe and generalized. The next day 3 c.cm. of magnesium sulphate solution were injected into the spinal canal, following on which there was a slight increase in pulse-rate and increased agitation of the patient; the legs appeared numb, and she could not move them; the choreic movements had diminished. Four days later the patient became somnolent, and the choreic movements were still less, but she complained of headache and nausea, which continued until August 20th. At this date the choreic movements were considerably less, and the patient could use her hands to feed herself, and could walk and write. On August 26th choreic movements were noticed in the arms and face, and on this day a fresh injection was given, preceded by a subcutaneous injection of morphine. The following day all choreic movements had disappeared and did not return. The last case was a girl of 11, who had suffered from chorea for a few weeks before admission to hospital on September 9th, 1908. She was then found to exhibit choreic movements of moderate intensity, and limited to the right side; there were also movements of the face, eyelids, and tongue. On September 11th 4 c.cm. of cerebro-spinal fluid was withdrawn, and 2½ c.cm. of magnesium sulphate solution injected, this being preceded by a subcutaneous injection of morphine. One hour later the choreic movements had become less marked, but the patient complained of headache and of a numbness in the limbs. The following day the choreic movements were still less manifest, but as movements of the right arm and face did not cease, another injection was given on September 13th. Fifteen minutes later the pulse quickened, the patient felt nauseated, complained of headache and of vertigo, and the temperature rose slightly. The following day the choreic movements were much less marked and became less and less, and by September 18th had altogether ceased. The author points out that these cases

show that intraspinal injections of sulphate of magnesia exercise a remarkable sedative effect on choreic movements, and that by this treatment the disease completely disappears after a few days, and that these results are superior to those obtained by any other method of treatment. This method of treatment is, however, not without drawbacks: thus, Meltzer and Auer have found respiratory troubles occur, and others have noted motor and sensory disturbances, and sometimes urinary troubles. Some of the ill effects following the injections appear to be due to the toxicity of salts of magnesia, but it is also possible that they be due to impurities in the salt employed. The author has found that subcutaneous morphine injection has diminished the headache and pains following intraspinal injections, and he has never seen urinary troubles follow in young subjects. He is convinced that this method of treatment constitutes an excellent therapeutic measure in Sydenham's chorea, and may be employed in both mild and severe cases.

191. Intestinal Massage in Heart Disease.

MAX HERZ (*Monats. für die phys.-diät. Heilmethoden in der ärztlichen Praxis*, 1 Jahrgang, 1 Heft) recommends a system of intestinal massage for the treatment of chronic constipation in cases of heart disease. Even though the explanation of the intimate connexion between affections of the gastro-intestinal tract and the symptoms of heart disease may vary from time to time, the fact of the connexion is undoubted. Thus in cases of heart disease the severity of the subjective symptoms is seen to vary with the changes in the course of a chronic constipation. The combination of chronic constipation with the symptoms caused by arterio-sclerosis, and especially by arterio-sclerosis of the coronary vessels, is so frequent that it is claimed that constipation is a cause of the arterio-sclerosis, and it is probably not accidental that anatomical diseases of the circulatory system are usually found with atonic constipation, but the so-called heart and vessel neuroses with spastic constipation. Experience also teaches that treatment of disease of the circulatory system is most effective when normal intestinal action can be restored. Intestinal massage for conditions of intestinal atony is in general use, but it has been objected to for cases of heart disease on the theoretical ground that the emptying of the abdominal veins as a result of massage may momentarily increase the work of the heart, and at the same time lead to an increase in the amount of the circulating blood. On this theory abdominal massage would be obviously contraindicated in cases of abnormally high blood pressure. Herz testifies that these fears are altogether without foundation, at any rate for the simple form of intestinal massage which he advocates. Most systems of abdominal massage are complicated, and include manipulations intended to strengthen the abdominal muscles, others to help to push on the contents of the intestine in the desired direction, and a third group to remove the supposed accumulation of venous blood in the abdominal vessels. Herz, on the other hand, attacks only those parts of the large intestine which are found on palpation and percussion to be pathologically changed, these parts being the caecum, which is often much distended; the ascending colon, which can be felt as a firm cylindrical body; and the sigmoid flexure, parts of which are palpable as hard, sometimes spindle-shaped, sometimes knotty, masses. The affected parts are treated by a very light kneading, while with the finger tips pressure is made on the median side of the abdominal wall to push the palpable masses outwards until they slip of themselves inwards again under the fingers. At the beginning this manipulation is often painful, but the pressure is then reduced, and only increased again as the patient becomes accustomed to the treatment. Herz likes to end up with light vibration, either manual or with the usual apparatus, applied to the same regions. Such treatment carries with it no danger of injury to a weak heart from emptying of the abdominal veins; and since, in an overwhelming majority of the cases, a spontaneous evacuation of the bowel very quickly ensues, Herz maintains that the more complicated and severe methods are superfluous.

192. Meningococcal Serum in Epidemic Meningitis.

LANGE (*Med. Klin.*, February 21st, 1909) has studied the figures of two epidemics of epidemic meningitis, during which 85 cases were admitted into the Augusta Hospital at Cologne. In each case the diagnosis was confirmed by the discovery of Weichselbaum's meningococcus. During the first and the more severe epidemic, between March and September, 1907, 57 cases were admitted. Fourteen of

these were not treated with serum at all; of these, 13 died (92.8 per cent.), 4 of which were dying on admission. Thirty-seven were treated with serum, but not systematically: of these, 23 (62.1 per cent.) died, of which 1 was dying on admission, 1 died from septic infection of a puncture wound, and 2 from hydrocephalus; if these 4 are excluded the mortality is reduced to 51.3 per cent. During the second epidemic, between December, 1907, and October, 1908, 28 cases were admitted. Of these, 24 were treated systematically with large doses of serum (adults 30 to 40 c.cm., children 10 to 20 c.cm.), on an average every other day, but, if necessary, more often. The injections were intradural. Of the 24, 9 died (37.5 per cent.). Lange considers the numbers too small to show definitely whether an early resort to serum would give better results than when the serum is given late, but the figures given suggest that this may be so. No harmful effects of the serum injections were observed. The low mortality of the cases in the second epidemic is, at any rate in part, accounted for by the milder nature of the epidemic.

PATHOLOGY.

193. The Serum Diagnosis of Syphilis.

IVY MCKENZIE (*Journ. of Path. and Bact.*, January, 1909) reports on experiments which he has carried out by the complement deviation method first suggested by Wassermann, Neisser, and Bruck. The haemolytic system which he used was one obtained by the treatment of a 5 per cent. suspension of ox red blood corpuscles with haemolytic immune body from the serum of a rabbit treated with ox corpuscles, guinea-pig serum being used as a complement. The corpuscular suspension was treated with five times the minimum haemolytic dose of immune body. As antigen, watery and alcoholic extracts of various organs were employed; in the preparation of the extracts one part of the chopped and pounded organ was put in four parts of normal saline with a ½ per cent. carbolic acid, or in 96 per cent. alcohol, well shaken from time to time, and at the end of twenty-four hours filtered for use: 0.1 c.cm. of the solution of extract in 0.6 c.cm. normal saline was employed for each tube in the experiments. The syphilitic and other serums to be tested were inactivated for one hour at 57°C. before use, and 0.05 c.cm. was, as a rule, used for each test tube. Out of one series of 57 cases in which a clinical diagnosis of syphilis had been made, positive reactions were obtained in 50 instances. No opportunity presented itself of examining the blood of the patient before the appearance of secondary symptoms, but the author's observations led him to believe that in the later stages of the disease the reaction is more marked. A very striking amount of complement was absorbed in some long-standing cases of gummata with bone lesions. Twenty-three cases of nervous disease (locomotor ataxy and general paralysis) were examined, and it was found that in 19 instances the blood serum gave a positive result. In 15 of these 23 cases the cerebro-spinal fluid was also examined: it yielded positive results in 9 instances. It was noted that the cerebro-spinal fluid never gave a positive reaction when the blood serum reaction was negative. The whole of the foregoing results were based on observations made with the same sample of extract: in its preparation one part of congenital syphilitic liver with milium gummata and numerous spirochaetes was added to four parts of 96 per cent. alcohol, and filtered after twenty-four hours. During the six months in which the extract was used it seemed to undergo little or no change as regards its visible effects on the haemolytic system used. The author found that by dialysis the extract of syphilitic liver lost to a considerable extent its original deviating property, and filtration of the dialysed extract through a Berkefeld filter practically removed the deviating power. From a case of congenital syphilis he prepared alcoholic extracts of various organs in the same proportions: the suprarenal, muscle, lung, and kidney extracts exhibited the power of deviating complement in greater or less degree, but in no case was their activity as great as that of the liver extract. Summarizing his results, the author concludes that the complement deviation method, when carried out with due care, may be of great service in the diagnosis of syphilis. Of 80 cases of syphilis examined, 69 gave a positive reaction and 11 a negative reaction: while from a control series of 53 cases only one gave a positive reaction, and the clinical diagnosis in that case must be considered doubtful.

CORRECTION.

In paragraph 171 of the *Epitome*, of April 3rd, the name printed "Javallion" should be "Cavallion."

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

194. Constitutional Eczema of Infants.

REGARDING eczema as a manifestation of some constitutional anomaly, E. Feer (*Muench. med. Woch.*, January 19th, 1909) calls attention to the fact that in its chronic forms this manifestation is most commonly met with during the first year of life. Acute eczematous are frequently true dermatites, and even intertrigo may be regarded as such. The real chronic eczematous are frequently produced as secondary infections in children possessing a particular anomaly of constitution. He prefers to divide the latter into two large classes: the weeping, scab-forming head eczematous and the disseminated dry eczematous. The former usually attack fat or pasty children, or even those who look rosy and robust. The children, however, may lose a considerable amount of flesh during the course of the illness. As a rule, it starts as a marked seborrhoea of the scalp, and a weeping, scabbed, purulent crust of the haired scalp is rapidly formed and spreads on to the cheeks, leaving the nose, mouth, and conjunctivae intact. On the face it may form scabs or remain moist. The hands and forearms may be infected by direct contact. Rarely, the neck, arms, body, and legs may be affected, while more frequently the groins or other joint folds of skin are affected. As a rule there is not a great deal of itching. The children are most frequently overfed, constipated children with good digestions. Even breast-fed infants are not uncommonly attacked. Spontaneous cure may take place at the end of the first year of life, when a mixed solid diet is given. The second form attacks artificially fed infants almost exclusively. There may be overfeeding. The children are usually pale, thin and flabby. Chronic intestinal disturbance is not infrequently present. It manifests itself as discrete, dry, red desquamating infiltrating islands together with small papular pustular patches, and may attack the whole body. There is but little tendency to weeping or to the formation of scabs. This form has been described as gouty, while Marfan ascribes it to an autointoxication from the intestine. The treatment of infantile eczema is difficult, and many practitioners neglect it altogether, and await spontaneous cure. The public at times has a dread of external treatment, on account of occasional unfortunate accidents. Attacks of fever and the occurrence of convulsions are seen even when the treatment is carefully carried out, and death may take place quite suddenly, with all the characteristics of cardiac failure or dyspnoea, fever, and intoxication symptoms. Feer has observed a number of such "eczema deaths," and has found records of about 30 cases. He believes that these cases are for the most part cases of status lymphaticus. His usual treatment of infantile eczema consists of softening the scabs with oil or vaseline, which must be gradually done; weeping surfaces are treated with very dilute solutions of acetate of aluminium, and subsequent application of zinc paste (oxide of zinc, starch, aa 25 grams; yellow vaseline, 50 grams). Mild patches may be powdered with zinc oxide and talc (3 in 7). Scratching must be prevented. When the healing is delayed he adds the following medicaments to the paste: Naphthalan (5 to 10 per cent.), tamenol (1 to 3 per cent.) for itching; lenigallol (1 to 5 per cent.) for obstinate weeping; sulphur or thigenol (2 to 5 per cent.) for seborrhoea; salicylic acid ($\frac{1}{2}$ to 2 per cent.) for infiltrations, etc. When the patches no longer secrete much fluid he finds the following ointments useful: Either a bismuth and zinc ointment or Lassar's ointment, consisting of hydrarg. sulph. rub. 1 gram, sulphur 10 to 20 grams, and yellow vaseline to 100 grams. For obstinate disseminated cases he finds sulphur baths useful at times. Obstinate dry eczema may require some Fowler's solution. The most important part of the treatment, however, is the dietetic. Breast-fed infants should be fed not more than five times daily, and only for a short time. From the third month onward he advises barley water if the reduction of the mother's milk does not cure alone. With artificially-fed babies the quantity of food must be reduced to a minimum. The daily supply of milk should be reduced to $\frac{1}{2}$ to $\frac{3}{4}$ litre, according to the age of the infant. When necessary, the amount of carbohydrate may be increased to make up for the small quantity of milk. If the eczema does not heal within one or two weeks, he reduces the milk still further. Some loss of weight is not harmful to a fat, over-

fed baby. After the fourth month of life the treatment becomes easier, as more starchy food can be given. In the second half year he gives finely divided stewed fruit with very little sugar, or possibly sweetened with saccharin, or raw fruit, green vegetables, and potatoes. If this fails to cure, milk may be stopped altogether for two to four weeks during the second half year, or it may be sufficient to use skimmed milk. Eggs should be avoided under all conditions, as should be soups. After the eczema has healed the reduced quantity of milk should be kept up for months or even years. In the disseminated form in thin wasted children underfeeding may not be employed, but carbohydrates should be substituted for milk, and attempts should be made to fatten the children with these means. In conclusion, he discusses his experience with Finkelstein's method of giving whey. He believes that good results are obtainable in this way, but does not see any advantage over the method described above.

195. Heredity in Diabetes Mellitus.

In a reprint from the *Medical Chronicle*, January, 1909, R. T. Williamson publishes his observations upon the hereditary tendency in diabetes mellitus. In a series of 100 hospital cases recorded by him ten years ago a family history of the disease was obtained in 13, and this present publication is the result of his investigations in 250 cases (157 male, 93 female) occurring in private practice, and in which on careful inquiry a family history of the disease was obtained in 47—that is, 18.8 per cent., while in 100 of these more specially investigated such a history was obtained in 22 cases, and this may be regarded as the minimum percentage. As a control to these statistics a family history of the disease was inquired for in 50 cases seen in consulting practice in which the patient was not suffering from diabetes, and none of these presented any history of the disease. Grouping these cases with regard to age a family history was obtained more frequently in patients under 40 than in those over 40 (50.6 per cent. and 13.7 per cent. respectively). On an examination as to the relatives most frequently affected by the disease, they were in order of frequency—brother, father, mother, sister, and in 5 instances among the 250 cases (2 per cent.) the husband or wife of a diabetic patient also suffered from the disease; but such instances cannot, of course, be included in any tables of heredity. Some striking examples are recorded of this family tendency—for example, in a family consisting of two sons and two daughters, two sons and one daughter became diabetic. Each had lived in different towns, and several years elapsed between the onset of the disease in the three cases.

196. Typhoid Fever and Crises of Subnormal Temperature.

COURTELLEMONTE and HAUTEFEUILLE (*Echo Méd. du Nord*, November 15th, 1908) cite a case of typhoid fever in the course of which several crises of subnormal temperature occurred, without the presence of any serious complication. On the seventeenth day of a comparatively mild case, in which the temperature had for some time remained nearly at 104°, the patient, at midnight, had a sudden and violent rigor, with a general sensation of cold. The face was pale, and the extremities felt cold. The temperature, which had been 103° at 9 p.m., had fallen to just over 97°, and she complained of an indelible sense of illness, with some tendency to syncope. After a subcutaneous injection of caffeine, the general condition gradually improved, but at 3 a.m. the temperature was only 94°, regaining its former height, of between 103° and 104°, about mid-day. The same deferescence took place on the following night at the same hour, and on four subsequent occasions; each crisis, after the first two, being a little less marked and a little less prolonged, the last two occurring during the day. There was no sign of intestinal haemorrhage or of meteorismus, so that perforation was excluded, and no exciting cause for the phenomenon could be found in connexion with heart, lungs, liver, spleen, or nervous system. Pus appeared in the urine on the day following the second crisis, explaining the occurrence of pain on pressure in the right renal region; but in two days the urine was clear again, and the pain ceased in two days more. The disease ran its course without further complication, convalescence being marked only by a long period of subnormal temperature. In trying to discover the

cause of the defervescence, the authors eliminate renal or hepatic insufficiency, gangrene, profuse diarrhoea, sloughing, and profuse sweating, the symptoms of the renal complication having been too mild to cause so grave a crisis. Pyramidal has been given for the high temperature, and it has been found that such subnormal readings were caused by the use of antipyretics; but in this case its administration had been discontinued before the appearance of the first crisis, and they are inclined to attribute the symptom to the effect of the typhoid toxin on the heat centre in the brain.

SURGERY.

197. Gastric Neuroses from a Surgical Standpoint.

DEAYER (*Amer. Journ. of Med. Sciences*, February, 1909) considers the so-called gastric neuroses from the point of view of the surgeon. There are many conditions directly or indirectly causing what is termed "nervous dyspepsia," the origin of the symptoms being referable to some very definite lesion either within the stomach itself or in one of the various organs concerned in digestion which together form a system correlated in every part. A pure gastric neurosis without any evidence elsewhere of neuroses or neurasthenic conditions is most rare, and the most important feature in the diagnosis is the eliciting of a careful history pointing to the general neurasthenic condition of the patient. Producing symptoms of infinite variations, such a diagnosis is most difficult to make, and the existing textbook descriptions of symptoms of diseases of the abdominal organs are practically useless in helping towards the formation of an early diagnosis. Carcinoma, gastric ulcer, puncture ulceration of the mucosa, etc., frequently give rise in their earliest stages to symptoms of so varying a nature as to lead to a diagnosis of nervous dyspepsia, a correct diagnosis being made only when it is too late. As it is more clearly recognized that all the organs of digestion form a system correlated in every part, it will be more readily seen how lesions of any one portion of the tract may give rise to symptoms apparently referable to the stomach only, as has already been recognized in the case of the gall bladder and appendix, and more frequent diagnoses of gall-bladder dyspepsia, duodenal dyspepsia, and appendical dyspepsia will, by such greater refinement of diagnosis and the advising of prompt surgical interference, be attended with better results in the treatment of such conditions. Many other conditions external to the gastro-intestinal tract may reflexly similarly operate in producing symptoms of nervous dyspepsia—for example, renal, pelvic lesions, etc.—and it becomes increasingly more evident that, as a rule, the origin of such symptoms can be traced to some very definite lesion within or beyond the stomach. With but very few exceptions the surgeon's attitude towards these cases should be one of "hands off," if possible separating them from secondary dyspeptic conditions due to lesions possibly coming within the scope of operative interference, while to operate merely for the mental effect upon the general neurasthenic condition is regarded as illogical.

198. Preoperative Sterilization of Septic Cavities by Hot Air.

QUÉNU (*Bull. et Mém. de la Soc. de Chir. de Paris*, No. 4, 1909) points out the difficulty of adequately sterilizing before operative removal a hollow organ—such, for instance, as the uterus or rectum—which is the seat of ulcerating cancer. He has in such cases tried preliminary injections of antiseptic fluids, curetting, and cauterization by chloride of zinc; but these methods have not proved sufficient, and curetting, from its liability to set up intravascular inoculation, is not free from risk. A recent attempt has been made by the author to solve this problem by injecting hot air. In a case of cancer of the uterus the removal of the diseased organ was preceded by the introduction into its very foul cavity of air heated at first to 300°, and afterwards for three or four minutes to 600°. The patient made a good and speedy recovery, and during the after-treatment did not present any abdominal complication. Culture media to which, after the operation, minute portions of the fluid contents and of the desiccated and scorched inner surface of the removed uterus were added, remained sterile. In dealing with some adverse criticism made by Guinard the author of this communication expressed the opinion that the action of the intensely heated air would not be likely to affect the deep tissues, and also that in a case of uterine cancer

it would not extend through the Fallopian tubes and injure the abdominal viscera. In removal of the rectum, however, it would be necessary to take some special step to protect the upper portion of the intestinal canal.

199. Operative Treatment of Ascites due to Hepatic Cirrhosis.

BOGOJAWLENSKY (*Zentralbl. für Chir.*, No. 9, 1909), after an expression of opinion that omentopexy in cases of ascites due to cirrhosis of the liver has not completely fulfilled early expectations, holds that such good results as have resulted from this operation are due mainly to the simple laparotomy and not to the endeavour to establish a collateral circulation by suturing the omentum to the abdominal wall. The good obtained by mere exposure of the abdominal cavity is attributed to an increased capacity of the peritoneum for absorption being set up by the hyperaemia resulting from this operation. The author agrees with Klopstock that in many cases of hepatic cirrhosis the ascites is due rather to an inflammatory condition of the peritoneum than to a mechanical obstruction in the portal circulation. This chronic inflammation, it is suggested, is set up by irritation of the membrane by toxic matter which, in consequence of the impaired function of the liver, is carried by the blood to the whole organism, and particularly to the contents of the abdominal cavity. In 10 cases treated by the author, after the whole of the ascitic fluid had been withdrawn, the parietal peritoneum was moistened by normal solution, and afterwards dried by gauze. This method of treating ascites by laparotomy and artificial irritation of the peritoneum should be regarded, the author points out, as strictly contraindicated in cases in which the renal functions are compromised.

200.

Appendicitis in Children.

ALLISON (*Amer. Journ. of Surg.*, No. 2, 1909), in an article on borderline cases in medicine and surgery, points out that in appendicitis in children the diagnosis is rendered difficult by a lack of subjective response and an imperfection of clinical history. These, which are often associated with other difficulties, need deep consideration, for the facts that in young subjects the walls of the appendix offer comparatively less resistance to irritating agents, and that the omentum is immature, indicate a far greater danger of peritoneal sepsis and the necessity for promptness in surgical treatment. There is less vomiting and nausea occurs less frequently in appendicitis than in the gastro-enteric disturbances of childhood. In the "stormy" type of the disease, however, the symptoms are more marked. In such cases the position will often suggest the nature of the attack, the little patient inclining to the right side, with the right lower limb flexed, and the hand acting as a guard over the affected area. Muscular resistance has less weight, clinically, than in adults, but if elicited by gentle manipulation it strongly favours the diagnosis. In the differential diagnosis care should be taken to determine the absence or presence of inflammation in the chest cavity, and also of disease of the hip. Persistent vomiting, abdominal pain, a high temperature and a quick pulse, leucocytosis, muscular resistance during the quiescent periods, the above-mentioned position of the patient in bed, will all, if chest lesions can be excluded, strongly indicate in children an acute attack of appendicitis.

OBSTETRICS.

201.

Treatment of Placenta Praevia and Eclampsia.

The treatment of placenta praevia and eclampsia consists in delivering the patient as rapidly as possible. In the case of the former, the woman runs a risk of death from haemorrhage until the birth is completed, and the child's life is endangered the longer the process of birth lasts. In the case of eclampsia, it has been shown that in from 60 to 80 per cent. of the cases the fits cease after delivery. No difference appears to exist whether the birth is spontaneous or artificial. K. Baisch (*Munch. med. Woch.*, January 19th, 1909) states that it is only logical to deliver the patient immediately after the first eclamptic fit. According to Bumm, the mortality of women delivered immediately after the first fit is 2½ per cent. The difficulty, however, which presents itself is that the os uteri and cervix are closed, and that in the majority of cases these have never been previously dilated, since the patients are usually primiparae. Baisch considers that *accouchement forcé* by means of combined version and extraction, dilatation with

the bag or with Bossi's dilator, is unjustifiable, as the interference may be more dangerous than the eclampsia itself. Mueller's bag is safer than Bossi's instrument, but the two may be combined by applying the bag first with moderate traction, and when the cervical canal is dilated enough Bossi's dilator may open the canal sufficiently to allow of version and extraction, forceps delivery or perforation. Even under the most favourable circumstances, however, these methods scarcely yield better results than an expectant treatment, since valuable time is always lost. He therefore comes to the conclusion that no satisfactory method exists which permits of a safe non-operative delivery of the eclamptic woman. With regard to placenta praevia, combined version by the method of Braxton Hicks has for many years been the standard treatment. The conditions differ from those applying in eclampsia. The greater the danger for the mother, the less may the condition of the fetus be taken into account. In eclampsia the maternal mortality of about 30 per cent. renders it necessary to neglect the child. The infantile mortality in eclampsia is from 20 to 25 per cent. The maternal mortality in placenta praevia is less than 10 per cent. This mortality although high is not so high that the child's life need be neglected. By Braxton Hicks's method, from 5 to 8 per cent. of the mothers die, while from 60 to 80 per cent. of the children also die. This means, therefore, that the child is sacrificed to save at most 5 per cent. of the mothers. By dilators, the maternal mortality has been reduced to 5 per cent. and the infantile mortality to 50 per cent. This is not much better than the result of combined version. Bossi's instrument is still worse, and tamponade does not yield better results. Dührssen has introduced a method by means of which the danger to the mother is kept at a minimum and the rapid delivery of the infant secures a good chance of survival. This is anterior hysterotomy. The dilatation of the cervix and os is dispensed with altogether, and by the help of an exact incision through the cervix, room is made for the passage of the fetal head. Some operators regard the friability of the cervix and its engorgement with blood as an indication for an extra-peritoneal operation through the abdominal wall, but Baisch points out that Dührssen's operation is incomparably less dangerous than a laparotomy. In Munich forty vaginal sections have been performed for conditions including placenta praevia and eclampsia. All the mothers have recovered, and of 22 living fetuses 19 have been saved. He regards this method as the ideal one for both the named conditions. A. Fiessler (*Muench. med. Woch.*, January 26th, 1909) pleads for the extraperitoneal abdominal operation for placenta praevia, which Kröwig and Sellheim have adopted as the operation of choice for this condition. He attempts on the strength of 9 cases to compare in percentages the value of this method with that of version (35 cases) and vaginal Caesarean section (10). He does not adduce any new facts beyond those depending on the experience of the Tübingen clinic.

202. The Milk in Wet Nurses.

PORCELLI (*Riv. di Clin. Pediatr.*, February, 1909) discusses the quality of the milk in the case of consecutive nursing from the point of view as to its nutritive value. His material is not large, as he has only examined the milk in the case of two healthy nursing mothers, one nursing up to the seventeenth month after the birth of the child (the milk was examined for the last four months), and the other up to the eighteenth month. The milk in each case was examined as to density, amount of water, dry residue, density of dry residue, salts, fat, proteins, and lactose. In one case menstruation reappeared at the sixteenth month. The weight of the child was also taken at regular intervals. His general conclusions are that the nutritional state of the infant is best in the following order: (1) When nursed by its own mother; (2) when nursed by a wet nurse with the first milk; (3) when nursed by a wet nurse with the second milk, provided that this milk is not too old and the milk be given, as in the first case, in the child's own home, or at least the wet nurse lives so near as to be watched daily. Artificial feeding gives the worst result as compared with any of the previous alternatives.

THERAPEUTICS.

203. Inunction Method of Administering Drugs to Children.

RACHFORD (*Amer. Journ. of Med. Sciences*, January, 1909), from previous experience with inunctions of guaiacol in the treatment of tuberculosis in infants and children,

points out the value of this method of treatment for all drugs which are capable of being so administered, and which are intended to influence lymphatic or blood diseases, or to act favourably upon the respiratory passages or at the point of excretion. The cutaneous surface in infants being four times greater in proportion to the body weight than in adults the whole blood and lymph circulation is in closer communication with the blood vessels and lymphatics of the skin, and drugs rubbed into the skin make their appearance quickly in the urine, faeces, bronchial mucus, and other secretions. The vasomotor mechanism also being more responsive to reflex stimuli than in adults, and the lymphatic functions being more active, the facilities for absorption by the friction and heat of inunction are greater in infants than in adults. Since in young children nutritional problems in the treatment of diseases are of the greatest importance it is evident that when drugs can be administered other than by the stomach the risk of upsetting digestion and nutrition is avoided. Experimentally it was shown that such drugs as guaiacol, iodine, oil of wintergreen, and salicylic acid were capable of being easily introduced into the circulating media of the body by inunctions through the skin, and that this result was more easily obtained in infants and young children than in adults. For inunctions of iodine a 6 per cent. iodine vasogen was used, while the other drugs were combined with anhydrous lanoline in the proportion of 1 drachm to the ounce. The chest and abdomen having been washed, hot moist towels were applied for a few minutes in order to warm and redden the skin. One drachm of the ointment was then gently rubbed into the chest and upper abdomen, the inunction lasting for from five to ten minutes. The drug generally appears in the urine within two hours, and the younger the child the sooner does this take place. Guaiacol administered by this method was found to be a valuable remedy in lymphatic tuberculosis, tuberculous peritonitis, streptococcal and other localised infections of the lymphatic tissues, pulmonary tuberculosis, and in all diseases where a pulmonary or bronchial antiseptic was indicated. In the treatment of influenza, bronchitis, and other respiratory affections in infants guaiacol inunctions have been advantageously used to the almost entire exclusion of expectorants. Mercury, and colloidal silver in the form of unguentum Credé, are among other drugs which can be administered most efficaciously by inunction.

204. The Treatment of Whooping-cough.

In a clinical lecture on the treatment of whooping-cough, E. Feer (*Deut. med. Woch.*, October 8th, 1908) shows that in the first year of life this disease is responsible for many more deaths than are measles, diphtheria, and scarlatina, while in the second year of life the mortality of pertussis is nearly equal to that of morbilli, is twice that of scarlatina, and is only second to that of diphtheria. In the third year it is considerably less. The disease is preventable, and as such should be prevented. This is, in the author's opinion, possible by carrying out a strict prophylactic treatment. In the first place, the patient should be isolated. As soon as the diagnosis can be made the patient should be separated from all healthy children until the cough has entirely disappeared. It is a very bad principle to allow children to play in open-air playgrounds with other children during convalescence from pertussis. Those who have been unavoidably exposed to infection should be isolated for from ten to fourteen days, and if then free from cough and catarrh may be allowed to go to school or mix with others. The most infective period is the early stage of the disease, before the cough has become characteristic. The sputum should be collected, if possible, in suitable vessels and disinfected, not so much to destroy the causal microbe of pertussis as to destroy other accompanying microorganisms. Feer does not believe that any good is done by disinfecting the patient's room after the attack is over. A suspected case should be treated just like a certain case until the true nature of the illness can be made out. Since no specific has up to the present been discovered, the treatment has to be conducted on wide lines. It has been noticed that rachitic, nervous, and neuropathic children are more severely attacked than other children. Feer is inclined frequently to ascribe the apparent beneficial effect of a certain form of treatment to the effect on the child's nervous system. It therefore becomes necessary to take the child's nervous disposition into account, and to pay attention to conditions which might influence this. He is a firm believer in the efficacy of careful treatment, even if this cannot be regarded as specific. The hygienic-physical-dietetic treatment forms the most important. Whooping-cough children do best in pure air. Provided

that the weather is suitable, and that no fever is present, it is advisable to keep the patients out of doors. Wet, cold, and windy weather, however, is actually dangerous. Dust must also be avoided. When it is necessary to keep the patient in bed or in the room, it becomes essential to keep the air free from dust, warm and moist, and the patients should be prevented from soiling their hands on the floor. It is a great advantage, when possible, to place two rooms at the disposal of the patient (night and day rooms), so that proper ventilation, airing, and cleaning can be safely carried out. Change of air is only advisable when the conditions at home are bad, and must be strongly condemned when the patients have a good garden and airy, clean house. The only effect of such a change is that the infection may be spread far beyond the original area. Hydrotherapeutic measures are useful in complicated cases, especially for bronchitis and bronchopneumonia. The diet must be carefully attended to and must be suitable to the age of the patient. Physical measures are invaluable and must be carried out with coolness, kindness, and firmness. With regard to drugs, the vaunted specific medicaments may do good, even if they do not cure the disease. Quinine, best given in the form of capsules of the sulphate (as many decigrams in each dose as the child is years old, up to 1.2 grams), or eucanine, or, lastly, when diarrhoea, etc., is present, as quinine tannate, given in chocolate, at times exercises a beneficial effect on the bronchial affection. Fever does not feel justified in recommending tussol, aspirin, or antispasmin. The thyme preparations at times yield good results and at times fail utterly. The most usual preparations are Golaz's dialysate and Taeschner's pertussin. Insufflations of quinine, etc., used to be employed, but, as no good resulted, have been discarded. Bromoform, when carefully given, frequently acts exceedingly well. It may, however, only be given when the parents are intelligent and when it can be kept in well-stoppered bottles. Fever gives it in doses of $a + 2$ to 4 drops, a being taken as the number of years of age. Thus a child of 3 years would be given from 5 to 7 drops. This he gives from three to four times a day. Of the results obtained, he says that even severe cases usually recover in from four to six weeks under bromoform. The pure narcotics may be used, and of these codeine is the most suitable. It may be combined with guaiaacal carbonate. In severe cases, when the child becomes drowsy and the cough becomes less, sedatives may not be given, and it then becomes advisable to employ ammonia and senega as expectorants. Caffeine will also be found useful in these cases. As a rule, he starts a case with quinine or bromoform. If the results are not satisfactory, he tries some other drug after two or three weeks, and only in the severe cases with many attacks does he give codeine.

205. Treatment of Asthma and Emphysema.

BOELLKE (*Med. Klin.*, February 21st, 1909) has found pyrenol of great service in the treatment of emphysema and of asthma. It is given in doses of 3 to 4 grams per day. It is a product of Siam benzoic acid and thymol with synthetic benzoic acid and oxybenzoic acid, and is therefore an expectorant, and possesses by reason of the thymol an anaesthetic property. Boellke has observed its action in 39 cases, of which notes are given of 5. The dyspnoea is relieved in three to four days, and expectoration becomes looser generally on the second day. The cough soon loses its hard and paroxysmal character. A number of patients experienced a sense of well-being to which they had long been strangers. The bronchitic sounds disappeared from the chest, in many cases almost entirely. Relapses were observed in one case only. No harmful influence of the drug was observed, even with long-continued use. No lessening of the effect with time or cumulative action was found. Complications on the part of the heart, kidneys, or liver are not contraindications. Those who had formerly been treated with atropine or potassium iodide declared that pyrenol gave the best results.

203. Cerebral Hyperaemia as a Result of the Injection of Beck's Bismuth Paste.

ALAPY (*Pester Mediz. Chirurg. Presse*, January 17th, 1909) injected Beck's bismuth paste into a pleural fistula of seven months' standing in a child of 4 years. The next day the child complained of headache, and vomited several times, and in the evening she was found to be blind. Ophthalmoscopic examination revealed a "choked disc"

in each eye. Vision finally became restored, and the fistula healed. A similar case of bismuth poisoning was recently reported in which signs of poisoning occurred six weeks after the injection, and led to death. At the autopsy, besides the usual erosions and ulcers in the gastro-intestinal tract, a marked hyperaemia of the brain was found. In Alapy's case, it was probably hyperaemia of the occipital lobe which led to increased cerebral tension and blindness. Alapy thinks that such undesirable complications may possibly be avoided if the bismuth paste is not overheated, so that the substrate be not converted into the nitrite. The possibility of embolus may be avoided by using a paste made with a paraffin whose melting point is about 55°. It should be injected at a temperature of 55 to 60°.

PATHOLOGY.

207. Relation of Tetany to Parathyroid Glands.

MACCALLUM AND VOEGTLIN (*Journ. of Exper. Med.*, January, 1909) have endeavoured to ascertain in cases of tetany produced by parathyroidectomy the effect of the administration of various substances, chiefly mineral salts, which might occur normally or under pathological conditions in the animal body, and have paid particular attention to the soluble calcium salts. They have also investigated the changes in metabolism during tetany, and in the chemical condition of the tissues of animals dying in that condition. Recent researches, they point out, indicate an intimate relation between the various forms of tetany and relative or absolute insufficiency of the parathyroid glands. These glands are independent organs with a definite specific function, and are liable to variations both in number and in distribution. Failure to produce tetany experimentally is probably due to leaving behind some parathyroid tissue after an apparently complete extirpation. When extirpation is complete tetany appears, even in herbivora, but only a very small amount of parathyroid tissue is required to prevent it. The effect of the extirpation of the parathyroid glands may be annulled by the introduction of an extract of these glands even from an animal of widely different character. The active principle is associated with a nucleo-protein in the extract, and may be separated with this nucleo-protein from the remaining inert albuminous substances. Its effect in counteracting tetany appears some hours after injection, and lasts several days. The extract does not contain iodine. The authors think that in tetany there is some disturbance of the composition of the circulating fluids, normally prevented by parathyroid secretion, which disarranges the balance of the mineral constituents of the tissues. Possibly this is due to the appearance of an injurious substance of an acid nature, since the tetany may be relieved by extensive bleeding with replacement of the blood by salt solution. The calcium salts have been shown to have an important relation to the excitability of the central nervous system: their withdrawal leaves the nerve cells in a state of hyperexcitability, which disappears on supplying a solution of a calcium salt. Tetany may be regarded as an expression of hyperexcitability of the nerve cells from some such cause, since the injection of a solution of a salt of calcium into the circulation of an animal in tetany promptly checks all the symptoms, and restores the animal to an apparently normal condition. Injections of magnesium salts probably have a similar effect, but these effects are masked by the toxic action of the salt. The injection of sodium or potassium salts has no such beneficial effect, but rather tends to intensify the symptoms. This is also true of the alkaline salts of sodium, which the authors specially studied in respect to their basic properties. The investigators consider that the effect of calcium is of value in human therapeutics in combating the symptoms of spontaneous forms of tetany, and in relieving the symptoms in cases of operative tetany, and thus tiding over the period of acute parathyroid insufficiency until remnants of parathyroid tissue can recover their function, or new parathyroid tissue can be transplanted. It is in this way an important and convenient ally of the method of injecting parathyroid extract. Studies of the metabolism in parathyroidectomized animals show: (1) A marked reduction in the calcium content of the tissues, especially of the blood and brain, during tetany; (2) an increased output of calcium in the urine and faeces on the development of tetany; (3) an increased output of nitrogen in the urine; (4) an increased output of ammonia in the urine with an increased ammonia ratio; (5) an increased amount of ammonia in the blood.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

208. Brown-Sequard's Paralysis of Traumatic Origin.

DONATH (*Pester Med. Chir. Presse*, No. 1, 1909) reports the case of a man, aged 34, who in a drunken squabble was stabbed in the back with a clasp-knife; he fell in a heap, but was not unconscious. When admitted to hospital he suffered from hæmoptysis. He was an excessive smoker and drinker, and had had gonorrhoea. There was a wound 1.5 cm. long, to the right of the spinous process of the fourth dorsal vertebra. The power of the right leg was much diminished; his walk was highly spastic and parietic, and the foot dragged. The belly reflexes (the epi-, meso-, and hypo-gastric) were absent, as well as the cremasteric on the injured side; they were active on the left side. The patella and tendo Achillis reflexes were exaggerated on both sides, particularly on the right, where also there was foot clonus. Babinski's sign was absent. Disturbances of sensation began in front at the fifth rib, behind at the tenth dorsal vertebra. On the right half of the body there was tactile hypoaesthesia and acute hyperaesthesia; on the other side there was analgesia, including hypalgesia and thermæsthesia for cold as well as heat. The muscular sense in both extremities was good and equal. A marked anaesthetic district was found in front from below the nipple to the inguinal region, extending outwards as far as the nipple line. Behind was a similar area the size of the palm, at the side of the vertebral column from the ninth dorsal to the fourth lumbar. The part of the cord injured was in the fifth and sixth spinal segments, corresponding to the fourth dorsal vertebra. The innervation area of the fifth thoracic segment corresponds to the region of the fifth rib in front, and behind to the eighth vertebra. As to the absent belly reflexes, according to Oppenheim their centre is still lower, eighth to twelfth dorsal. In this patient, on the injured side the hyperaesthesia was very marked, while on the opposite side there was little or none; painful cramps occurred in the affected leg and in the right hypochondrium. During the attacks the patient groaned, his face became covered with cold sweats, and there were clonic convulsions (trepidation) in the extremity. Some of these attacks lasted five to ten minutes, and were probably due to some irritation of the pain-conducting fibres. Donath remarks on the surprising improvement which sometimes takes place in these cases, and must be attributed to the incision being clean, early union, vicarious action, regeneration and functional recovery consequently ensuing. In Brown Séquard's palsy the loss of sensation is quite intelligible; not so the improvement in function which occurs for pain sensation and motor palsy. Woroschiloff, Raymond, and Gowers have sought explanations; Oppenheim, Münzer, and Wiener assume that every stimulus which enters the cord through the posterior roots splits into two components, one of which goes up by the long, direct, ascending path, fasciculus posterioris, and enters the subcortical centres—cerebellar, bulbar, pontine. If an interruption in the long, direct, ascending path takes place, the splitting of the upward-going impulses is hindered and the whole turned over into the crossed path which goes to the conscious centres, and this causes increased intensity. On this hypothesis and under such circumstances all qualities of sensation should be increased on one side of the body, but up to the present this has not been observed. The assumption must, therefore, be valid for pain conduction. The fact that as a rule tactile anaesthesia is less marked and clears up more quickly is explained by Mann as due to the fact that stimulations of touch are specially conducted by the fasciculus posterioris, but that the centripetal path is open to them as long as they are still practicable. Other observers (Langendorf, Münzer, Wiener, Ziehen) and experimenters (Borchert, Borwinkow, Rothmann) assume the same paths for all sensations, while Head and Thompson think that the long fibres conducting touch also get to the other side by degrees, conduction for long stretches being double-sided. As to the cramps in Donath's case, he thinks they were different from the spasmodyia cruciata of Oppenheim, in which the tonic cramps were associated with pains in the opposite side. Worth noting also is the con-

trast between the abdominal and cremaster reflexes, which were absent on the lesion side, and the patellar and Achilles reflexes, which were exaggerated on both sides, particularly the paralysed.

209. A Family of Pleuritis.

LEONARDI (*Gazz. degli Osped.*, February 16th, 1909) reports the facts concerning a family several members of which developed pleurisy with effusion. All the family were marked by considerable pallor of a faint yellowish type, slight oedema of the eyelids, sluggish in movement and in mind, and, as it were, submyxoedematous. In 1901 the eldest son, aged 19, developed a pleural effusion on the left side without fever and without pain, and attributed to cold. This was twice tapped and about 5 litres of serous fluid withdrawn. Cure soon followed and the lad entered the army, and a year later had another attack of left pleural effusion, for which he was tapped. Somewhat later he had a third attack with effusion as before. No sequelae were left, no adhesions, and no tubercle. In 1902 a brother, aged 16, had an attack of right pleurisy with effusion, for which he was tapped twice. This also was unaccompanied by fever or pain and left no sequelae. The boy was hardly cured when a younger sister, aged 14, developed a mild pleurisy with effusion, which was absorbed without any paracentesis. In 1903 the mother, who was a robust woman about 40, developed pleurisy with effusion (tapped twice), which only slowly cleared up. She had some trace of albumen in the urine and presented a pemphigous kind of eruption on the skin which was hard like scleroderma; the pulse was frequent and of high tension. The sister of this patient was said to have suffered for a long time from a similar skin trouble and to have died of dropsy. In 1904 the child of the eldest son in its turn developed an empyema. The author thinks there is something more than mere coincidence in his group of cases, and suggests that the root cause predisposing was a kind of submyxoedema, due in its turn to want of proper action of the thyroid. The only member of the family who did not develop pleurisy (the eldest daughter) was very anaemic and suffered from oedema of the lower limbs.

210. Tobacco Poisoning in an Infant.

JULES LEMAIRE (*Ann. de Méd. et de Chir.*, March, 1909) relates a case of acute tobacco poisoning. The accident occurred to an infant of 1 year of age. He prefaces the story by referring to the fact that classical authors describe two forms of acute tobacco poisoning: (1) The acute, evanescent form with malaise, nausea, vomiting, headache, vertigo, and cold sweats; (2) the grave form, with excitement, headache, vertigo, affections of the sight and hearing, slowness of pulse, dyspnoea, vomiting and diarrhoea, extreme weakness with coldness and stupor, ending in collapse with intense dyspnoea, failure of the pulse, and death by asphyxia. The case in point occurred on December 12th, 1908. The infant, 1 year and a few days old, swallowed a cigarette made by W. D. and H. O. Wills, known as Three Castles brand. This occurred at 6 o'clock at night, after which the infant had its usual meal and went to sleep. After a quiet sleep of about an hour the infant woke and began to cry and vomit; he turned pale, the face was covered with a cold sweat, and diarrhoea followed. Dr. Lemaire saw the patient at 9 p.m.; he was collapsed and sleepy, pale, with cold extremities, but the pulse and respiration were not interfered with; there was much yawning, and the vomited matter contained much mucus and pieces of the cigarette. Pieces of the tobacco were also found in the stools, and were more numerous there than in the vomited matter. The infant was given two cups of warm tea with one teaspoonful of cognac, and kept warm with hot water and cotton-wool. Towards midnight the child went to sleep and next morning was quite well. The clinical picture presents a case of acute tobacco poisoning in a mild form, but the diarrhoea and collapse would lead one to classify the case as one intermediate between the grave and mild forms of poisoning. Inquiry led to the fact that the kind of tobacco the cigarette contained was pure Virginia and weighed slightly over 1 gram. The case was of special interest on account of the age of the patient—namely, 1 year and a few days.

SURGERY.

211. Slipping of Interarticular Cartilage of Temporomaxillary Joint.

UNDER the heading of *Discitis mandibularis*, Lanz of Amsterdam (*Zentralbl. f. Chir.*, No. 9, 1909) describes a morbid condition of the temporomaxillary articulation, marked by pain, a feeling of abnormal laxity in this region, and, occasionally, a distinct cracking sound during free movements of the lower jaw. Reference is made to two cases, the affection in each being unilateral and on the left side, in which the above troubles ceased after removal of the interarticular disc through a horizontal incision made over the lower margin of the zygoma. In each instance, on opening the joint, the cartilage was, it is stated, found to be abnormally loose. Although in neither of these cases was there any history of previous injury or of an inflammatory attack, the author insists on a close analogy between this affection of the temporomaxillary joint and the so-called "internal derangement" of the knee-joint, now regarded as being almost always due to a slipped semilunar cartilage. The mandibular condition described by the author of this paper seems to be identical with that known in this country as subluxation of the temporomaxillary joint, which Annandale has successfully treated by fixing the retained disc by suture.

212. Gangrenous Lymphangitis of Scrotum in the Newborn.

ANDREI (*Riv. di Clin. Pediatr.*, February, 1909) reports 3 cases of this condition, aged 20 days and 2 months respectively: 2 of these recovered and 1 died; he also refers to 7 other cases reported by various authors. As far as the details were given in the various cases the diseased process began in the thigh in 2 cases, over the crural arch in 1, in the umbilical region in 3 cases, the place of origin was not mentioned in the other cases. The processes associated with the separation of the cord are a common starting point for the septic infection which sets up the lymphangitis: in one of the author's cases (the fatal one) this was undoubtedly the case. In two of his cases the streptococcus was found, both locally in the pus of the metastatic abscesses; in the third case *Staphylococcus pyogenes albus* was found in the pus of the secondary abscesses. The disease begins in some slight lesion which usually escapes notice, then the red striae of a lymphangitis and slight red oedema appears. This stage lasts from three to five days. After this the pubic region becomes suddenly red, the scrotum is enormously enlarged, the penis is also affected in a similar way. The scrotum is hard, tender, and dark red in colour, with purplish patches on its anterior surface, and sometimes bullae; necrosis quickly sets in, and the whole of the testes may become exposed. Symptoms of general infection usually accompany this stage of the disease. If the child survives, the breach in the tissues is rapidly made good; it is possible the testes may subsequently atrophy from inclusion in the scar tissue. The chief condition simulating this gangrenous lymphangitis is erysipelas. Treatment, apart from that directed to the general septicæmia, is local and surgical and consists in free incisions into the scrotum either with a knife or, better still, with the thermocautery.

213. Sprengel's Deformity.

A. E. HORWITZ (*Amer. Journ. of Orthop. Surg.*, November, 1908) brings together and investigates all the known facts and theories concerning this interesting malformation. The scapula in its development is a cervical and not a dorsal appendage. It retains that position throughout fetal life. In its development it passes through the different stages of lower forms, and repeats the history of its species. In congenital elevation alterations in shape are found coinciding with conditions normally seen in the scapula of lower animals—namely, increase in width and diminution in length, rounding of the superior median angle and articulations with the vertebral column. If these articulations were of secondary growth due to attrition, they would be bony throughout, whereas the union at either end or both ends is by means of cartilage. They are, according to Minot, due to centres of ossification appearing within the sheet of development of the scapula. The affected scapula, situated from two to four vertebral bodies' distance above its fellow, is rotated upon its sagittal axis. This is due in part to the weight of the arm and in part to retracted muscles. Scoliosis existed in nearly half the cases. The curve must be regarded as of congenital origin, parallel with defective ribs and vertebrae and other evidences of arrested development elsewhere in the body; cleft palate, spina bifida, congenital

dislocations, undeveloped limbs, etc., are due to the same mechanical pressure causes. The undeveloped scapula is not to be regarded as a deformity due to these same causes, but as of another type. The scoliosis is neither primary nor secondary to the elevated scapula. Torticollis is seen in 10 per cent., and cranial asymmetry is 1½ per cent. These deformities are not dependent upon each other, nor upon the elevated scapula. Sprengel regarded this deformity as an upward displacement due to pressure exerted *in utero* through lack of amniotic fluid. The author believes that this is a factor which retains the scapula in its original high position. The caudal migration of the scapula depends upon muscular traction. When this is insufficient, as it may be when the intrauterine pressure is excessive, or when abnormal articulations exist, or when the musculature is *per se* defective, Sprengel's deformity is seen. Treatment consists in operation and gymnastics. The results in cases operated on, where an articulation existed, were good. A degree of improvement is offered by stretching and gymnastics.

OBSTETRICS.

214. Pregnancy and the Puerperium in connexion with Cholelithiasis.

SINCE the time of Langenbuch's and Naunyn's monographs the more frequent incidence of gall stones in women than in men has been abundantly recognized, while the interest of gynaecologists in the subject has increased as observations accumulated on the onset of gall-stone colic in connexion with the puerperium or the end of menstruation. J. Hofbauer (*Med. Klin.*, No. 7, 1909) reviews the literature on the causation of gall stones, and finds that the essential factors, apart from bacterial action, are stagnation of bile, precipitation of cholesterol, free protoplasmic substances, or cell desquamation. An examination is next made of the results of *post-mortem* examinations of the livers of women who have died from intercurrent causes either during pregnancy or the early part of the puerperium. It is found that such livers are characterized by: (1) Fatty infiltration in the central parts of the lobules and diminution in the amount of glycogen in the same regions. (2) Stagnation of bile with deposition of layers of pigment in the central parts of the lobules, together with widening of the gall capillaries. (3) Ectasy of the central veins and the capillaries leading to them. There is present also in the tissue of Glisson's capsule an inflammatory condition of the connective tissue layer such as is found in pregnancy in the mucous membrane of the larynx or the bladder, and the lumen of the bile ducts contain mucous and lymphoid cells which have here and there pressed in from without. We thus find a series of conditions present which help towards the formation of gall stones. Thus stagnation of bile is shown to be present; insufficiency of the liver cells has been scientifically demonstrated to tend to the precipitation of cholesterol; and finally in the larger bile ducts we find hypersecretion of mucus and emigration of lymphoid cell elements. But the presence of concretions does not necessarily imply an attack of gall-stone colic; and Kehr, for instance, calculates that the presence of gall stones only gives rise to symptoms in 5 per cent. of the cases in which they exist. The chief complication to determine an attack is infection of the biliary passages, which may take place from the intestine or through the blood, and a second complication is hindering of the flow of bile. These two factors both come into force far more frequently during the puerperium than during pregnancy; resorption of bacteria from the genital tract, followed by their elimination through the bile, and displacement of the intestines due to changed pressure conditions in the abdomen post partum play the greatest part in producing them during the puerperium. In accordance with these observations is the fact that attacks of gall-stone colic occur far more frequently in the first and second weeks of the puerperium than in pregnancy. The influence of menstruation is next considered. A history is often given that an attack of gall stones coincided with the end of a menstrual period. Our knowledge of any change in the liver coincident with menstruation is very scanty. Senator observed four cases of menstrual jaundice which he ascribed to hyperæmia of the liver leading to swelling of the biliary passages; and Metzger speaks of a relative stagnation of bile under the influence of menstruation. These and similar observations can only be received with reserve as showing a causal connexion between an attack of gall stones and menstruation; but they are supported by recent investigations which show that during menstrua-

tion changes take place in different organs, as, for instance, in the mucous membrane of the larynx and nose, which are similar in nature though considerably more mild than those occurring during pregnancy.

GYNAECOLOGY.

215. Pelvic Pain: Bone Tissue in Fallopian Tube.

DEVEZE (*Ann. de Gyn. et d'Obstét.*, March, 1909) reports a case where a woman aged 44 had been troubled for twenty years with a feeling of weight in the perineum. There was also severe dysmenorrhoea. She had married when 20 years old, and had never borne a child. There was marked retroflexion and retroversion. A hard nodule as big as a walnut, not tender on pressure, could be defined on the posterior wall of the uterus. After six sittings the uterine displacement was cured by Thure-Brandt massage and a pessary. The pains had entirely disappeared, but they returned at the end of a month. Devezé operated and removed a pair of enlarged sclerotic ovaries, the larger, the right ovary, being as big as a hen's egg. There was a small myoma as large as a chestnut on the posterior wall of the uterus, which organ was removed. The right Fallopian tube was as rigid as a tobacco pipe. At the junction of the inner and middle third was a hard mass of the bulk of a grain of Indian corn. When the tube was laid open the mass was seen to be porous like a fragment of bone, and on microscopic examination was found to consist of true bony tissue. Devezé considered that the presence of the bony mass accounted for the dysmenorrhoea, as the contraction of the Fallopian tube on the resistant body set up violent colicky pains. He was of opinion that the bone was a relic of an old fetal sac which had undergone bony change as a form of degeneration.

216. Ovarian Cysts Developing after Hysterectomy for Fibroid.

BROWN (*Amer. Journ. Obstet.*, February, 1909) has observed this condition twice in his own operative practice. A woman, aged 39 years, came under his care for a large ventral hernia in the line of a former laparotomy scar, and a small cyst could be defined to the left of the cervix. The patient had undergone myomectomy in 1903 and subtotal hysterectomy in 1906. Brown operated in the autumn of 1908; there were abundant dense pelvic adhesions. One ovary had been removed, the other was the seat of a unilocular cyst of the dropsical follicle type. The second patient underwent subtotal hysterectomy for a lobulated bleeding fibroid; as in the first case one ovary was removed. About a year later an ovarian cyst developed, and Brown removed it. He found that the tumour was a cystic dilatation of a Graafian follicle, with no trace of adenocystoma, and he ascribed the cystic degeneration of the ovary in both cases to disturbance in the circulation of the ovary caused by previous removal of the uterus.

THERAPEUTICS.

217. The Treatment of Syphilis with Mercury.

K. ZIEGLER still regards mercury as the most important remedy in the treatment of syphilis (*Muench. med. Woch.*, November 17th, 1908). The efficacy of mercury, however, is in his opinion dependent on the proper administration of the drug. Dealing first with "grey oil," he says that it has always been described as mercury emulsified in liquid paraffin. The latter is unabsorbable, and for this reason attempts have been made to substitute for it an oil which is capable of being absorbed. Oleum oleicini, which is castor oil obtained at a high temperature and therefore sterile, proved to have this property; the author therefore prepares his grey oil in Neisser's clinic as follows: Hydraz. puriss. bidestill. 40 grams; lanolin. puriss. steril., 15 grams; and ol. oleicini steril., 45 grams. The mercury is first carefully rubbed with the lanolin until an equal and fine emulsion is obtained, and then the oil is gradually added. When properly carried out, the preparation yields mercury globules of equal size varying between $\frac{1}{4}$ and $\frac{1}{2}$ of the size of a red blood corpuscle, that is, not exceeding 2μ in diameter. When the mercury is finely divided, the injections are painless, non-toxic, and readily absorbable. After standing for a long time, some separation of the oil takes place; but, inasmuch as the oil cannot become rancid, simple shaking will again mix the ingredients up and render it safe for use. Since the introduction of this new preparation

694 cases have been treated by its means, and the author shows that the advantages to the patients are considerable. In three quarters of the cases large doses up to 0.14 gram of mercury were given without producing any severe forms of intoxication. Some patients received ten or even twelve injections of 0.14 gram of mercury in all. Men tolerated the high doses better than women, in whom infiltration, etc., sometimes occurred. He therefore gives women from 0.05 to 0.07 gram as a rule, and never exceeds 0.1 gram. In one case five injections of 0.14 gram beside salicylate of mercury and calomel in a weakly patient led to loss of weight, stomatitis, and severe anaemia; but these effects disappeared under suitable nursing, etc. While he admits that there is no reason to push the dose very high in women, he finds that the doses in which his grey oil can be given guarantee an energetic action of the mercury. It is necessary to employ a first-class oil for the purpose, and also to select the cases with care, if good results are to be expected. With regard to the injection syringe, he states that a great degree of exactness is required in the graduation. Barthélemy has introduced an instrument which admits of the injection of 0.01 gram of mercury in the 40 per cent. oil being accurately given, 1 c.cm. of the oil weighs 1.25 grams, so that each cubic centimetre contains 0.5 gram of mercury. Each graduation on the syringe, therefore, corresponds to $\frac{1}{20}$ of a c.cm. The syringe and the platinum iridium needle must be sterilized before use and the injections must be carried out into the gluteal muscles. Care must also be taken that the point of the needle has not entered a blood vessel before the injection is made. When the first two or three injections are followed by hard infiltrations he does not continue the treatment, as it is evident that the oil has become encapsuled. The injections should never be made in the same place twice in the same course. In robust persons he injects the grey oil every fourth or fifth day, but later he increases the intervals between the injections. Next he turns his attention to calomel injections. Grey oil is the best remedy for patients who do not need a very rapid removal of symptoms. When the latter is required, calomel is the best form of mercury. Ten per cent. suspensions are usually very painful when injected. Lang suggested that calomel could be employed in the same manner as metallic mercury in grey oil, and showed that the injections were less painful. The author uses the following mixture for this purpose: Calomel 4 or 5 grams, lanolin anhyd. camphor. 5 per cent., and ol. oleicini camphora. 5 per cent., in proportions of 1:3, to make 10 c.cm. This yields a mixture which contains 40 per cent. by weight of calomel. The calomel must be absolutely pure, and is best prepared by the wet method, washed in pure ether or in boiling alcohol. The manipulations should be carried out in the dark to prevent any chemical dissociation. He injects 0.112 to 0.12 gram of calomel *pro dosi*, and repeats the injections every four to six days. A course includes from eight to fourteen injections. Of 32 women submitted to the course, 7 manifested no ill effects. One patient was given three injections, of which two led to softening and abscess. This patient had shown intolerance of other forms of mercury injections. Of the rest, only a few patients complained of pain at the injections and the like slight side-effects; 146 men were also injected with calomel. Although some pain was complained of on a few instances and slight signs of mercurial poisoning were seen occasionally, the doses were readily absorbed in the vast majority. The author recommends this method of applying mercury to the practitioner who has to treat bad cases of syphilis.

218. Tuberculin and Similar Preparations.

MOELLER (*Muench. med. Woch.*, November 10th, 1908) believes that the subcutaneous application of tuberculin cannot exert any deleterious effect on the body, save inasmuch as the temporary disturbance of the general health during the reaction is concerned. The fear of the results of the injections, which he considers to be unjustified, is, nevertheless, widespread, and at times offers an insurmountable obstacle to its application. For such cases Moeller proposes other methods of giving tuberculin. First he deals with inhalations. The chief disadvantage of this method is the impossibility of an exact dosage. The nasal application of tuberculin is better, but does not equal the subcutaneous injection in sharpness of results. Tuberculin can be applied per rectum in the form of suppositories, or as enemata, and can produce reactions in this way. Calmette has found, and Moeller, too, has seen, that tuberculin given by the stomach can exercise its specific action. This has been tested in animal experiment. The author soon learned

that when given by the stomach in man, even when the acid had been partly neutralized, it did not give satisfactory results. Tuberculin given in *gelduratur* capsules, however, is absorbed smoothly, and produces the full effect of the toxin. The capsule is not attacked in the stomach, and only after it has passed into the bowel is the tuberculin set free. The *gelduratur* capsules are made of the wall of the small intestine. Moeller found that when given in this way tuberculin exercises the same action as when applied subcutaneously. Not only for diagnostic purposes but also for treatment does the physician meet with patients who object to tuberculin, when injected. The objection disappears when he is asked to swallow the drug. The objections to treatment with ordinary tuberculin and with bacillary emulsion are to a certain extent justified on account of the fact that hypersusceptibility at times sets in. This can to a certain extent be diminished or prevented by combining the emulsion of other acid-fast bacilli, which are nearly related to tubercle bacilli (for example, Timothy bacilli, blind-worm bacilli), and the author has shown that the specific process is equally manifested by the "tuberculinoids," that is, the emulsions of the other acid-fast bacilli, as by the true bacilli of Koch. The dose of the allied tuberculin, however, has to be higher than that of the real tuberculin. Next, the author discusses the combination of calcium formate with tuberculin, on lines similar to the combination of the formates with diphtheria antitoxin, which is supposed to be useful. He has experimented in this direction, and has introduced a combination which he calls tuboid. This is put up in *gelduratur* capsules, each capsule containing 0.001 mg. of tubercle bacilli in emulsion, 0.0001 c.c.m. of emulsion of Thimothein, and 0.01 gram of formate of calcium. At first he gives one capsule every second day, and after two or three weeks he gives one every day. Naturally the variations in dosage must be considered in each case. He found this method of treatment useful in children with tuberculous glands. Febrile patients often lose their fever under the influence of tuboid. Further, he has found it very useful in the tuberculosis of pregnant women. The effect of the treatment is characterized by the disappearance of night sweats, the diminution of the cough, and the easing of expectoration. Purulent sputum becomes serous, and the appetite improves. He has obtained good results in early stages and in the larvated forms in which the general condition is considerably affected.

219. Physical Treatment of Bronchial Asthma.

ALOIS STRASSER (*Monats. f. d. physikal.-diätetischen Heilmethoden*, January, 1909) has during the last sixteen years made use of hydrotherapeutic measures for cases of asthma: the methods employed have been the customary ones which have for their object lessening of the general reflex irritability by stringing up the nervous system—for example, general douches, local douches applied to the legs, simple and Scottish douches to the epigastrium. Such measures have often given good results even in severe cases where asthma has been complicated by bronchial affections such as chronic swelling and exudative catarrh, the treatment being indeed that employed for bronchial affections apart from asthma. On the other hand, in a number of severe cases these douches, etc., have had no result. V. Strümpell has of late warmly advocated electric incandescent light baths for bronchial asthma; and Strasser, working on V. Strümpell lines, fully confirms his view as to the benefit to be obtained from such baths. Strasser has in some respects varied the manner of the bath as recommended by V. Strümpell. Especially he has modified the after-treatment, and instead of allowing the patient after the bath to remain in a bath of sweat, and be gradually cooled off during two hours in bed, Strasser in mild cases follows up the bath, which is not more than of ten minutes' duration, with a douche or rubbing down, followed by movement of the muscles, while in more severe cases the bath takes a slightly longer time. The hydrotherapeutic measures which follow are milder, and the patient rests in bed after them for from one to two hours. Strasser finds that in asthmatic patients it may be as long as from seven to eight minutes before the bath causes a profuse perspiration, and he regulates the duration of the bath not by the amount of sweating induced but by the subjective condition of the patient; as a rule the initial baths are not longer than from six to eight minutes in duration, and a bath of more than fifteen minutes is scarcely ever given. Daily baths are found to be in some cases exhausting, and they are therefore given either every other day or on two days out of each three; on the intervening days either the treatment is intermitted or general mildly tonic hydrothera-

peutic treatment is given. V. Strümpell does not recommend that the baths should be taken at the height of the attack, but Strasser has found them useful under such circumstances in cutting short the attack. As to the method of action of the baths Strasser agrees with V. Strümpell in laying special emphasis on their diaphoretic effect, and in the view that the light may also have a specific action both on the sweat glands and on the glands and epithelium of the bronchial mucous membrane, to aid secretion, and possibly to lead to the excretion of harmful substances. Strasser also, from the result of observations of the effect of heat upon hysterical patients suffering from spasm of the cutaneous vessels and at the same time from bronchial spasm, suggests that the baths may have a direct antispasmodic action simultaneously on the skin and on the internal organs. The author's conclusion is that whatever be the method of action the baths are undoubtedly of great value in cases of bronchial asthma.

PATHOLOGY.

220. Studies in Anaphylaxis.

RICHET (*Ann. de l'Inst. Pasteur*, June, 1908) has extended his studies of anaphylaxis, using for the purpose of his experiments on dogs a toxin which he terms "actino-congestin." This substance, which is similar in its physiological action to the "mytilo-congestin" employed in earlier experiments, is prepared by extraction from the tentacles of *Actinea equina* and *Aneomina cereus*, animals found attached to rocks on the Mediterranean coast. He finds that the organism of the animals inoculated with congestin manufactures a special substance, quite different from antitoxin, which he proposes to call "toxogentin." This substance has not yet been isolated, but it has been found to exhibit certain well-marked physiological characteristics. The toxogentin is innocuous, since dogs brought into a condition of anaphylaxis present every appearance of good health, and their blood, when inoculated into normal dogs, produces no pathogenic effects. This toxogentin has, however, the remarkable property of developing a poison when it reacts with congestin, the result being that when congestin is injected either in a dog in a condition of anaphylaxis or in a dog which has received a dose of serum from a dog in a condition of anaphylaxis, the animal thus treated very rapidly dies. For the reaction which takes place the author suggests the formula—"toxogentin + congestin = apotoxin." The toxogentin, produced by the first injection of congestin, takes some time to develop. Its incubation period has not been precisely determined, but the commencement of its formation has been noted as early as the sixth day; the maximum development appears to be reached by the twenty-fifth day; it then persists without diminution for fifty days; after this it declines, but is still evident as late as the one hundred and thirty-fifth day. Apotoxin appears to be a poison possessing a selective action on the nervous system, since its effects are inhibited by the administration of an anaesthetic. Besredka (*Ann. de l'Inst. Pasteur*, June, 1908) seeks to explain the curious fact that whereas anaphylaxis is produced in the guinea-pig with small doses of horse serum ($\frac{1}{10}$ to $\frac{1}{100}$ c.c.m.), large doses (3 to 5 c.c.m.) not only produce less effect in the direction of anaphylaxis, but actually protect the sensitized guinea-pig against the effects of anaphylaxis. His theory is that in every normal serum two properties or two substances are present, the one possessing the character of antigen, the other that of antilysin. He calls the former "sensibilisinothen," and the latter "antisensibilisin." The former is thermostable; it has the property of giving rise in the guinea-pig, twelve days after injection, to "sensibilisin" (= Richet's "toxogentin"), that is, the substance which creates the anaphylactic state. The antisensibilisin is thermostable; it has the property of combining with the sensibilisin wherever it encounters it, whether the latter be free in the blood or fixed in the nervous system. It is the violent encounter of antisensibilisin with sensibilisin in the nervous system which gives rise to the disturbances characteristic of anaphylaxis. The violent conjunction of these two substances may be prevented if we cause the two to come into contact with each other gradually. This is accomplished by using for inoculation a very large dose of serum, owing to the fact that the large amount of antisensibilisin present in the dose of serum picks out the sensibilisin gradually as it is in process of being formed (that is, in the preanaphylactic period). The same result may also be obtained by bringing a very small dose of antisensibilisin into contact with sensibilisin (vaccination by minimal doses of serum in the anaphylactic period).

AN EPIITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

221. Relapsing Tuberculous Polyarthritides.

PONCET has during recent years put forward the view that attacks of arthritis running an acute course may be of tuberculous origin, and are analogous to the arthritis of other infectious diseases, such as syphilis, gonorrhoea, etc. Schaffer (*Zeit. f. Tuberk.*, Bd. 13, Heft v) accepts Poncet's view and reviews the whole question in connexion with the notes of 11 cases which have come under his own observation. Poncet divides the cases into primary and secondary ones according as the joint affections are the first sign of tuberculosis or appear during the course of an already evident tuberculosis. He also divides them into three groups: (1) Cases of arthralgia, (2) of acute and sub-acute arthritis resembling rheumatic polyarthritides, (3) of chronic arthritis, resembling any of the different forms of chronic joint rheumatism. Cases belonging to the first group may later pass into the second and finally into the third. Poncet finds that the joint affections are in many cases due to the action of tuberculous toxins and in some possibly to that of tubercle bacilli of little virulence. The first of Schaffer's cases is that of a child 13 years of age, who at 5 years of age had suffered from spondylitis lumbæ, and who was now being treated for suppurating tuberculous glands. The case belongs to the first group of arthralgias. The child during the course of the illness suffered from pains in different joints accompanied by slight rises of temperature; the pains never lasted for more than a few days at a time, but with remissions and exacerbations continued for almost a month. Later on there was a monarticular relapse without rise of temperature. The joint affections disappeared as the more obvious tuberculous lesions were recovered from and as the general condition improved. The next case was a similar one, but there were no elevations of temperature, and at two different times there were effusions into certain of the affected joints. In three cases the main features resembled those of attacks of acute joint rheumatism; the temperature, however, never rose to the extreme height of rheumatism, the effusions were fairly often indolent in character, movement of the joints was possible to the extent allowed by the effusion, the general condition was less affected than is usual in rheumatism, and in none of the cases was there a history of a previous angina; in one instance there was, in addition to a strong general tuberculin reaction, also a very marked local reaction. The sixth case was marked by frequent effusions into both knee joints, with final complete recovery; this patient passed through an attack of scarlet fever later without having any joint complication. The next three cases illustrate the tendency for the tuberculous joint affections to finally become localized in a single joint, after it has for a longer or shorter time taken the form of polyarticular attacks. One of them was a primary case—that is, joint affections which came and went were for a comparatively long time the only signs of disease, but the patient finally developed a coxitis with abscess formation. In the tenth case also the joint affections were the first sign of disease; here the patient suffered later from tuberculous nephritis. There is a tendency to agree that such tuberculous joint manifestations are toxic in origin, but Schaffer is of opinion that the toxin acts directly on the synovial membrane rather than indirectly through the central nervous system, as has been suggested by some authorities. Where the condition passes into that of a typical chronic tuberculous affection, it may be considered that the previous attacks of local toxæmia have weakened the resistance of the joint to invasion by the tubercle bacilli. The diagnosis has more especially to be made from acute joint rheumatism. Here the family and personal antecedents of the patient must be considered. The clinical picture also differs from that of acute joint rheumatism in several particulars, which, taken together, are of much significance. The general condition is not at all, or is much less, affected in tuberculous than in true rheumatic joint affections. The acute attacks are not accompanied by sweating; primary angina is not observed; in none of the author's cases was endocarditis present, although in rare instances a tuberculous endocarditis has been noted by other observers; relapses continually recurred; and, still more important, salicylates were altogether without effect. The differential diagnosis from joint affections

accompanying the exanthemata, the secondary stage of syphilis, and gonorrhoea, is also considered. In the tuberculous joint affections the reaction to tuberculin, if positive, is a help to diagnosis, and especially if there is, as in one of the author's cases, a local joint reaction. The prognosis depends to some extent upon the condition to which the joint affections are secondary; and as a rule, though not invariably, the joint affections tend to disappear as the primary condition improves. The danger lest the acute cases should develop into cases of chronic tuberculous arthritis makes the prognosis less favourable. The local treatment of acute tuberculous arthritis is purely symptomatic, the chief treatment being that of the principal condition—that is, sanatorium treatment of the tuberculosis.

222. Tic-Douloureux.

BETTREMIEX (*Nord Medical*, November 1st, 1908) reports a case of facial tic seen by him first in 1897, lately seen again, and found to be without recurrence. The patient was an accountant who had previously submitted to resection of the alveolar ridge, which had given him only nine months' relief. Bettermiex, fixing his attention on the usually neglected symptom of lachrymation, found obstruction of the lacrimal duct in both eyes, although the pain affected only the right side of the face. He catheterized both ducts thoroughly, and followed up the procedure by antiseptic injections. Improvement was felt after two or three days and complete relief in a few weeks. Two years afterwards a slight recurrence took place and was relieved by the same means, since which time the patient has been radically cured. As tic-douloureux is said to be incurable Bettermiex has published this case, with the advice that when trigeminal neuralgia is associated with lachrymation, permeability of the lacrimal ducts, and subsequent disinfection, should, always be secured.

SURGERY.

223. Vaso-cellular Carcinoma of the Scalp and Skull.

CHARLES M. FOX (*Quarterly Bull. North-Western Univ. Med. School*, September, 1908) reports a case of vaso-cellular carcinoma of the scalp and skull from the clinic of Professor W. B. Schroeder. A piece of the skull, 10.5 by 11.25 cm. in size, was removed by means of chisel and mallet, and the defect was filled in by a dense connective tissue, that held the brain so firmly that the normal convexity was lost and the exposed area flattened. The motor centres for the leg, arm and face were all found located anterior to the fissure of Rolando. This was also found to be the case in five subsequent cases in which the brain was exposed. A discussion on the various methods of opening the skull follows, and attention is called to the use of the chisel and mallet, particularly on the ground of availability and simplicity. The author believes, after some experience with electrical instruments for this purpose, that ultimately they will be ideal, but that at present there are some difficulties to be overcome. In regard to the closure of defects in the skull, it is stated that this should not be done unless for some sound indication, as no case is reported in literature where a fatality resulted from the presence of such a defect, and frequently a dense fibrous tissue fills in the defect. Experimental work done on twelve dogs gave the following conclusions: (1) Connective tissue plays a very important part in the repair of defects of the skull; (2) there may or may not be bony union, but if there is not the connective tissue union is firm enough for practical purposes; (3) old bone or bone stripped of its periosteum acts merely as a foreign body, and has little to do with closure of the defect; (4) it is important to have the skin wound and bone incision apart from each other on account of the possibility of a skin infection causing a meningitis.

224. Tracheal Scleroma.

MAYER (*Amer. Journ. Med. Sciences*, February, 1909) having noted the remarkable results obtained in cases of external scleroma by the use of x-rays, gives an additional report upon a case of scleroma of the larynx, previously recorded by him two years ago, in which a recurrence was

beneficially treated by the same method. Ten months after the first report a recurrence of the growth took place, causing rapidly progressing dyspnoea. Increasing tracheal stenosis due to scleroma, with secondary involvement of the intranasal mucous membrane existed, and tracheotomy was performed by an incision $\frac{1}{2}$ in. long through the cricoid cartilage and tracheal rings, thereby exposing the bifurcation of the posterior and lateral aspects of the trachea. The growth, which extended $\frac{1}{2}$ in. below the larynx, was greyish-white in appearance, and resembled mucous polyps, readily breaking down. A large tube was inserted with packing about it to keep the wound open. Two days later this was removed, and under chloroform, while the edges of the wound were held apart by retractors, a five-minute exposure to high-frequency current at a distance of 8 in. was given. Paroxysms of coughing and frequently vomiting followed whenever the patient was in any way disturbed, phenomena which were not present prior to the x-ray treatment. After an interval of eight days five to six minute exposures were again commenced, and repeated at intervals of two or three days, during three weeks. The growth was found to be greatly decreased in size and the coughing and vomiting reflexes much diminished after the first four exposures, and within six weeks from the commencement of treatment the tube was removed and the patient was discharged as cured, the voice being normal and there being no dyspnoea and no tumefaction of the larynx. A year later the general condition was good and the respiration normal, the patient expressing herself as quite well, except for occasional nasal obstruction. A small pink mass on the right inferior turbinate bone was present, and on the left side of the septum was a rounded mass about 1 in. in length, which was removed by snare. The larynx and trachea showed perfectly normal conditions, there being no sign of any recurrence. Should a recurrence be present at any future time, good results may be expected to follow external x-ray application over the cicatrix, since this would not present the same resistance as normal tissues; but, failing that, it would be easy to reopen the wound and make application locally.

225. Otitis Media and Convergent Squint.

KNAFF (*Archives of Ophthalmology*, September, 1908) publishes a case of paralysis of the sixth nerve, which came on during an attack of influenzal otitis media. A child, aged 5, developed earache and headache during convalescence from influenza. This persisted for two weeks, and was associated with unusually severe pain in the right half of the face and the right eye. The gums on the right side were sore. Then the right eye turned in. Complete sixth nerve paralysis was found, no fundus change, drum red and slightly bulging. The pain is better, the ear condition was improving; so paracentesis was not done. The case recovered. The group of symptoms pointed to a lesion of the Gasserian ganglion. The ganglion lies close to the sixth nerve at the apex of the petrous pyramid. It is well known that this region can be involved by an extension of the purulent process from the tympanum along the cancellous bony tissue surrounding the ossicular labyrinth. The most recent paper on the subject is by Baldevinck (*Ann. d'Oculistique*, April, 1909). This author, after an exhaustive review of the clinical records and autopsies, regards the anatomical lesion which affects the sixth nerve as an osteitis of the petrous process. The complication occurs in cases where there is insufficient drainage. In the absence of other symptoms of intracranial disease the prognosis is good.

fluid from flowing back out of the uterus, an object which can be more simply attained by clamping the tube outside the vulva after the process of injecting fluid into the uterus is completed. The metreurynter is for use in cases in which the membranes have ruptured prematurely, the cervix being still present, and sufficiently dilated to admit one, or at most two, fingers, whenever version is either immediately indicated or when it seems likely to be needed later, as in cases complicated by narrowed pelvis or oblique or transverse presentations. The filling of the uterus should also be of advantage in prolapse of the cord or prolapse of an arm. The operation should obviously only be undertaken when there is a possibility of a living child being born, and it is, therefore, contraindicated where the conjugate is under 8 cm. If the cervix is not dilated to admit one finger, dilatation to the required extent is carried out by Hegar's dilators. The metreurynter is introduced after being boiled for ten to twenty minutes; in order to prevent air being carried into the uterus the tube for filling the uterus is connected beforehand with a Potain's pressure flask or a syringe filled with sterilized water or salt solution, and the water flows through the tube as the metreurynter is introduced. The tube is then clamped and the dilatation of the metreurynter with 1 per cent. lysolform solution undertaken. When this is completed the clamp is removed from the first tube and the fluid gradually injected into the uterus. There is a certain danger of separation of the lower edge of the placenta, and as a precautionary measure a few drops of fluid are allowed to return through the tube during the process of filling, and a little time after it is completed in order to ascertain that haemorrhage is not occurring. In the few cases in which the method has been employed it is found that from 400 to 500 grams of fluid can be injected into the cavity of the uterus, and this is enough to restore the power of performing external version. The dilated metreurynter forms an efficient tampon to prevent the escape of the fluid, and the operator can either perform version at once or can postpone any operative measure until dilatation of the cervix has proceeded to the required extent or until the metreurynter is expelled. The metreurynter should not be left in position for longer than twelve hours, and should after this time, if necessary, be replaced; this is, however, only necessary in the rarest cases, for as a rule adequate labour pains set in after from three to four hours, and the desired result quickly follows. Where such a procedure is adopted the fetus is spared the harmful effects of the long-continued pressure of the uterine wall in protracted labour, and it is therefore to be hoped that the prognosis for the child may become decidedly more favourable. The author has only once had occasion to use his instrument in a case of narrowed pelvis, in which it appeared likely that version might be required; delivery, however, followed spontaneously, and the case was therefore inconclusive. Bucura made use of the procedure in three cases, and warmly recommended it—the movability of the fetus within the uterus was found to be markedly increased after filling the uterus. In one case there was a certain amount of separation of the lower edge of the placenta, causing haemorrhage. In this case version was successfully performed, but owing to rigidity of the vagina and extension of the arms above the head delivery was difficult, and the child died as a result of the injuries it received during delivery. The author warmly recommends the procedure in the sort of case indicated in the article.

GYNAECOLOGY.

OBSTETRICS.

226. Premature Rupture of Membranes.

H. PETERS (*Medizin. Klin.*, February 28th, 1909) has designed a metreurynter which is combined with a tube for filling up the uterus in cases in which the membranes have ruptured prematurely and it is desired to retain the power of performing external version if that operation should be required later in the case. After laying before the Dresden Gynaecological Congress an account of his metreurynter the author found that a somewhat similar instrument had been already constructed by Bauer, of Stettin. Peters's metreurynter differs from Bauer's in that the tube for filling up the uterus is close to the tube for filling the metreurynter instead of very much to one side; the top of the filling-up tube projects above the top of the expanded metreurynter, instead of being level with it, and Peters dispenses with a valve inside the filling-up tube, which is intended to prevent the

227. Primary Cancer of Fallopian Tube.

DELAUNAY (*Paris Chirurgial*, No. 1, 1909) performed ovariectomy in May, 1908, on a woman aged 52, who had not menstruated for four years. The abdomen had been swelling for two years; there had been no discharge of any kind from the vagina. At the operation the left Fallopian tube was found drawn high up on the front surface of the ovarian cyst, strongly adherent to the tumour and as big as a man's thumb. The pedicle was not thick or broad, and was easily secured; the ovarian tumour showed no signs of any glandular or other solid growth, and contained clear deep yellow fluid. The right ovary and tube were normal. The diseased left tube was very thick-walled, and the fimbriae and plicae had undergone marked hypertrophy. Borel examined it at the Institut Pasteur, and reported "incipient cancer of the tube." Delaunay admits that no report of the ovarian cyst was made, but it showed no signs whatever of malignancy. In September Delaunay's patient began to

suffer from symptoms of recurrence, and she died in November, 1908, with secondary growths disseminated over the abdomen, and involving the parietes.

226. Ovary Removed Three Times.

RIES (*Amer. Journ. Obstet.*, April, 1909), with the design of showing the difficulty of extirpating a normal ovary entire, reported how a woman, aged 31, suffered when 24 years of age from pelvic abscess after the induction of abortion. Three years later the appendix was removed and part of the right ovary; a year later both ovaries and tubes were amputated, and Ries obtained possession of them. The right ovary looked as though complete like its fellow. Haemorrhage occurred, and the patient applied to Ries. He found a fibroid of the uterus, of the size of a fist, and removed it. The tumour proved to be an adenomyoma, and on the right of the uterus lay a structure which, on microscopic examination, proved to be a normal corpus luteum. Ries also referred to an older case. A woman underwent removal of both Fallopian tubes for suppurative. After recovery haemorrhages set in, and the uterus, full of myomatous growths, was removed. No ovarian tissue could be detected by the naked eye, but Ries made a number of sections through the posterior wall of the uterus, laying open a cavity smaller than a pea. It proved to be ovarian tissue spread out as a thin layer over the posterior wall of the uterus, and it included a perfect follicle containing a normal ovum.

THERAPEUTICS.

229. Ferratin.

IN 1894 Schmiedeberg prepared a substance from pig's liver by maceration with boiling water and subsequent precipitation with tartaric acid, which he designated ferratin. It contained 6 per cent. of iron in organic combination, unaffected by ammonium sulphide. No compound of a similar nature had ever been prepared from liver before, nor, so far as Schmiedeberg knew, from any other organ of the body. Later on, by heating white of egg with an alkali in the presence of an iron salt he obtained ferri-albuminic acid, which he holds to be identical with the original ferratin. Moreover, he considers from the mode of preparation that ferratin is the form into which iron must be converted before absorption into the system. If his contention were true it would raise ferratin to a position of extreme importance in the treatment of anaemia. Experiments carried out by Salkowski did not indicate that ferratin was in any way superior, but slightly inferior, to paraneulmine of iron, a substance introduced by Salkowski himself (*Zeit. f. Physiol. Chemie*, Bd. 84, iv, 1909). Moreover, no subsequent observer had obtained any compound with such a high percentage of iron from the liver. Hanmarsten prepared a nucleo-proteid from the pancreas by a method similar to Schmiedeberg's for making ferratin, but substituting hydrochloric for tartaric acid. In 1902 Becari prepared ferratin by Schmiedeberg's method, and found that it only contained 1.67 per cent. of iron (0.52 per cent. if made from ox liver). Scaffidi also found a nucleo-proteid in the liver of the dog, containing 0.18 to 0.44 per cent. of iron; he also obtained a nucleo-proteid from the liver of the pig, containing 1.93 per cent. of iron, rising to 3.59 per cent. after repeated washing. Salkowski repeated these experiments on the pig's liver, and obtained a nucleo-proteid with a fairly constant percentage of phosphorus in the case of each liver examined, but the amount of iron varied considerably. Without prejudice to the value of ferratin in therapeutics, he agrees with Becari and Scaffidi that the substance prepared by Schmiedeberg from pig's liver was not a new variety of compound or a ferri-albuminic acid, but a nucleo-proteid with a variable percentage of iron, and that the ferri-albuminic acid prepared from white of egg has no connexion with the iron-containing proteid in the liver substance. Scaffidi's results are published in the same number of the journal.

230. Anaesthesia with Artificially-limited Circulation.

THE dangers of general anaesthesia have led many surgeons to rely chiefly on infiltration, conduction, medullar, and venous anaesthetics, while attempts have been made by others to replace the usual anaesthetics by less toxic drugs. A third means of reducing the danger is to employ narcotics beforehand in order to lessen the quantity of anaesthetic required to induce full surgical

anaesthesia. Zur Verth (*Muench. med. Woch.*, November 17th, 1908) reports on the experience which has been made in Bier's clinic with a method introduced by Klapp. This depends on the observation that persons who have lost a great deal of blood only require small quantities of chloroform to put them to sleep. In order to diminish the quantity of blood to be saturated by chloroform, he employed a constricting bandage around the extremities, imprisoning a quantity of blood below the stricture. Corning first suggested a similar idea, and Zeigener performed some experiments on animals which demonstrated that this could be carried out in practice. Two rabbits were exposed to the same quantity of chloroform vapour in air for the same time. If the legs of one were constricted by a bandage, the anaesthesia was complete in half of the time required for the other. The animal so anaesthetized awoke from the anaesthetic sleep much more rapidly than the other. On testing the method on human beings, zur Verth found that strong men could be put to sleep quite readily by the ether drop method and kept asleep by slow continuation of the dropping. The quantity of anaesthetic was thus very considerably diminished when the legs were constricted as compared with the quantity necessary to anaesthetize a man under ordinary conditions. Since no harm has followed the Esmarch's method of rendering a limb bloodless, it was not expected that any harm would accrue by the constricting of a limb without driving the blood out of the limb. In practice no harm has been noticed. In discussing whether only the lower limbs or all four limbs should be constricted, he states that experiments were made on himself, his colleagues, and some patients. The pain at first was tolerable when all four limbs were constricted, but after fifteen minutes became so intense that no one could tolerate it. No changes in the pulse or blood pressure, however, took place. While the scopalamine-ether method of anaesthetizing offers such a material advantage over the ordinary method that a new method is scarcely called for, he found that the diminishing of the quantity of anaesthetic beyond the quantity required after scopalamine would undoubtedly be a considerable gain. By means of the artificial limiting of the circulation, the quantity of ether can be reduced to a very low level, and in this way it becomes unnecessary to employ a second toxic substance like scopalamine at all. The second advantage is the rapidity of awakening after the loosening of the constricting tube. Further, he considers it to be an advantage to have a large quantity of blood containing an excess of carbonic acid imprisoned, in case of accident. If the respiratory centre should become attacked by the chloroform or other anaesthetic, a sort of autotransfusion of carbonic acid-containing blood can be immediately applied by loosening the constrictions. This must work beneficially when it is recognized that it is not the want of oxygen but the excess of the toxic anaesthetic which causes the respiratory failure. The constriction is carried out without any previous hyperaemia or suspension, and must be so tight as to completely arrest the circulation. Only the legs are constricted.

231. Intravenous Injection of Strophanthus in Heart Affections.

DANIELOPOLU (*Arch. des Mal. du Cœur des Vaisseaux et du Sang*, November, 1908) has treated 23 cases of chronic heart affections by intravenous injections of strophanthus, and embodies the results obtained in a short paper. His 23 cases consisted of 8 mitral cases, some of which were accompanied by myocarditis; 6 cases of chronic myocarditis; 3 cases of aortic lesions, with chronic nephritis; 5 cases of a systole in emphysema accompanied with advanced chronic nephritis. The dose of strophanthus employed was 1 mg., which was repeated not sooner than twenty-four hours after the first injection. In some cases a single injection has sufficed to relieve systole, but usually two or more injections have been necessary. In no case in which the doses have been repeated has any symptom of accumulation of the drug in the system shown itself. The strophanthin employed was prepared by Merck and employed in aqueous solution, which was sterilized before being injected. One of the most marked effects of these intravenous injections was the extreme rapidity with which the drug acted. The author found that in cardiac cases with very advanced renal lesions the results obtained by intravenous injections of strophanthin were not so good as in cases where the kidneys were less seriously involved; in fact, where there was intense chronic nephritis, the improvement made was very slight. The author observed also, as did Tust and Hoepfner, that in cases of cardiac lesion and chronic nephritis, although the injection of strophanthin has had no immediate effect, yet it

has prepared the way for the action of theobromine, which, given to the same patients before they had received any strophanthin, caused no diuresis. As a result of his experience with the intravenous injections of strophanthin in cardiac affections, the author concludes that strophanthin should be considered one of the best cardiac tonics, the advantage it possesses over other cardiac tonics being: (1) The rapidity and energy of its action on the heart; (2) its exclusive action on the heart; (3) the possibility of one knowing the exact amount of the drug one employs. He also considers that the intravenous method is the best way to give strophanthin, and that this method does not cause the pain and oedema which follow subcutaneous injections. The dose employed should be 1 mg. of strophanthin, which may be repeated at intervals of twenty-four hours. Strophanthin strengthens the heart beat, slows the pulse, and increases arterial tension; further, it favourably influences the cardiac rhythm. It increases diuresis, causes oedema to subside and passive congestions to disappear. Lastly, its action is very rapid. In none of his cases has the author observed any untoward symptom as a result of this method of treatment.

232. The Treatment of Acute Rheumatism.

A. PLEHN (*Dent. med. Woch.*, Nos. 51 and 52, 1908) discusses the treatment of acute rheumatism, and emphasizes the wrong principle, which appears to be gaining ground, to throw overboard the older salicylates, on account of their supposed toxic effects on the kidneys. Luethje was the first to demonstrate the changes in the urine which are present when salicylates are given even in moderate doses. Klemperer considered that it is necessary to use the smallest doses possible, in order not to expose the kidneys to the toxic influence. Hauffe, representing the Schwenger school, which refuses all medicamentary treatment, claims to have obtained excellent results without salicylic acid. However, closer investigation has shown that the renal irritation of salicylic acid is more imagined than real, and that perfectly normal, healthy persons frequently pass minute traces of albumen, and even casts, without taking any of this drug. These forms of albuminuria not infrequently clear up while the patient is taking salicylates. Plehn considers that even if slight irritation of the renal apparatus were produced by this drug, since it acts specifically in rheumatic fever, just as mercury acts in syphilis and quinine in malaria, it would be wise to give it freely. He believes that it is necessary to give it in large quantities in order to obtain the full specific effects. First, however, it must be certain that the rheumatic affection is really acute. He prefers pure salicylic acid to the sodium or other salts. He gives it in doses of 1 gram (that is, about 16 grains) every two hours, or 0.5 gram every hour during the first day, but none during the first night. On the following days he gives 6 grams in $\frac{1}{2}$ or 1 gram doses. This is continued until the temperature has been normal for three days and all pains and complaints of all sorts have disappeared. Then he gives 4 grams a day for a week, and after three further days, during which the patient remains in bed but receives no salicylic acid, he allows him to get up, provided that no further symptoms develop. Men stand the doses better than women, and he finds by experience that the proper dosage of this drug can be calculated at 0.08 gram per kilo body-weight per day (this corresponds to about $\frac{7}{8}$ grains per stone). When salicylic acid produced disturbance of the stomach or other indications caused him to modify the doses, he preferred to substitute aspirin in doses of $\frac{1}{2}$ gram, given six to eight times a day. With these doses both of the acid and of aspirin the body-weight often increased during the medication, the kidneys were not attacked, and even during a nephritis the condition of the kidneys improved. Next he finds that salicylic acid acts prophylactically as far as the heart is concerned. Complications such as endocarditis and pleurisy occurred less frequently when salicylic acid could be given freely from the first than in those cases in which it was withheld. He brings forward evidence to show that this drug is not a cardiac poison when given as he has described. Next he deals with the actual frequency of heart affections in rheumatic fever, and shows that among 319 cases treated by him by salicylic acid, only 2 left the hospital with chronic heart disease due to the attack of fever for which the patient had been treated. Those cases which are treated outside without sufficient salicylic acid, and which when admitted prove refractory toward the influence of the drug, usually do well when treated by injections of quinine and antipyrin, or by intravenous injections of collargol. Finally he compares his results with those of Hauffe, who deals with his

patients by means of so-called physical therapy, and shows conclusively that his results are considerably better.

PATHOLOGY.

233. Pathology of Gastric Digestion.

O. COHNHEIM and G. L. DREYFUS (*Muench. med. Woch.*, December 1st, 1908) state that the watching of the digestive process through a high duodenal fistula is the only means of ascertaining all the details of the secretion and motility of gastric digestion. This method was first described by Cohnheim and Tobler. The present paper deals with observations and experiments on dogs, on which the high duodenal fistula was performed, and also dogs in which two fistulae were made in the duodenum, so that the gastric contents and the pancreatic juice could be collected separately. In other dogs a gastric fistula was made, while in another the oesophagus was divided in the neck. The dogs were fed by trial breakfasts and trial meals. In the first place they determined that the trial breakfast called forth the secretion of about 16 grams of saliva. The trial meal on the other hand, produced only from 6 to 7 grams. The former consisted of 400 grams of water or tea, and 50 grams of bread, well divided. Three minutes after taking food the pancreatic secretion and the flow of bile began; one minute later the stomach began to empty itself of its contents, which at first was almost clear fluid, and after became more and more acid. After from thirty-five to forty minutes the first traces of bread were seen. Taking the average of the experiments, it was found that the trial breakfast produced from 145 to 155 grams of gastric secretion, and more than 250 grams of pancreatic secretion and bile. The quantities did not vary materially. The trial breakfast consisted of from 250 to 350 grams of gruel, a beefsteak weighing from 110 to 150 grams, and from 250 to 300 grams of potato mash; 6 to 7 grams of saliva were secreted in response to it, while the quantity of gastric secretion was from 700 to 800 grams and of pancreatic secretion and bile was over 500 grams. The gastric contents were first thin and watery, and later became more acid and thicker. In injecting varying quantities of the gastric contents into the duodenum they found that proportional amounts of secretion and of albumen digested were to be measured. Quite small amounts were registered when no gastric content was passed on into the duodenum, more was found when small portions were passed, and much more when the full quantity was passed on. This is of importance in estimating the pyloric reflex. In order to compare the gastric digestion in the dog with that in man, they determined the acidity of the contents from time to time in the dog. They found that the total acidity was from 52 to 70 and the free HCl from 20 to 30, so that the values corresponded to those met with in man. This was when the trial breakfast was given. The conditions were more complicated when the meal was given. After discussing certain peculiar differences between the acidity of the material collected from the duodenal fistula from that collected through the gastric fistula, they record that the total acidity during the trial meal in dogs corresponds to that of the reclaimed meal in man. Considerable differences, however, were recorded in the free HCl. This was shown to be due to the larger quantity of pepsin which the canine gastric secretion contains as compared with human secretion. Having determined the physiological conditions, and having satisfied themselves that the values obtained by means of the stomach tube after trial meals are approximately correct, they proceeded to initiate pathological conditions. The ingestion of 5 per cent. ammonia produced a temporary gastric catarrh, but did not alter the digestion, nor the acidity, nor the motility. The injection of 4 per cent. NaCl or MgSO₄ solutions downwards into the duodenum produced diarrhoea and general disturbance. By carefully regulating the quantity injected they were able to produce nausea, diarrhoea, and general illness without vomiting, which terminated in recovery. This produced a distinct delay in digestion—a disturbance of motility. The sodium chloride produced hyperacidity and smaller quantities of secretion, while the magnesium sulphate produced the reverse—hyperacidity and increase in the total quantity. They lay great weight on the fact that an artificial disturbance of the duodenum is capable of altering the gastric digestion very considerably. They make the suggestion that in human patients a disturbed gastric digestion may possibly be due to a pathological condition of the bowel and not of the stomach.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

234. *de cur.* Anuria in the Newborn.

BAKKE (*Tidsskrift for den Norske Lægeforening*, No. 5, 1909) was called to see a female infant, 3 days old, who had had anuria since birth, and was then suffering from convulsions. The child was well developed and well nourished, and nothing abnormal could be detected on examination, such as swelling or tenderness in the renal or bladder region, or atresia of the urethra. A metal catheter was introduced into the bladder, but no urine came away. Thinking that some serious congenital defect was present, a grave prognosis was given to the parents and permission obtained for an eventual autopsy. To the great astonishment of the writer, he was told some days later that the child was living and quite well. It had become steadily worse until the fourth day, when it suddenly began to urinate and to improve rapidly. The only treatment carried out had been baths and administration of ether. The only suggestion the writer can give is the possibly delayed development of the kidney structure. With reference to this case, Jervell, in No. 6 of the same journal, points out that Casper reported a somewhat similar case in *Verhandl. der deutschen Gesellschaft für Urologia I Kongress in Wien*, 2-5 Oct., 1907. This occurred in a boy, 2 days old, who had not urinated since birth. To be able to pass the catheter into the bladder he had first to split open a phimosis and a very narrow external opening of the urethra. Casper therefore regards his case as a pure reflex anuria, thinking that the reflex action on the kidneys was caused by the deformities present. Adenot, in *Lyon Médicale*, 1905, reports 2 cases of anuria in infants, but the first of these cases appears to be a case of simple retention. The second occurred in a boy 36 hours old. By means of an india-rubber catheter 40 c.cm. of an opaque, thickened urine was withdrawn. On analysis it was found to be strongly acid, and gave on filtration a copious reddish-yellow deposit of acid urate of soda. There was a trace of sugar, but no albumen or biliary pigments. Some mucus undergoing dissolution was also present. The author points out that the presence of a trace of sugar and an excess of acid urate is normal in the urines of the newly-born, but the concentration found in this case was altogether excessive, and can only be explained by an anuria. The sequel in this case was also a simple one; after the first catheterization micturition was normally established, and the infant prospered.

235. Pathological Anatomy of Haemolytic Icterus.

VAQUEZ and AUBERTIN (*Arch. des Mal. du Cœur des Vaisseaux et du Sang*, November, 1908) report the case of a woman of 34, who was admitted to hospital complaining of weakness and loss of strength. She had been jaundiced from the 15th year of age. On admission she was emaciated and markedly icteric. Her urine was scanty and dark-coloured, but did not react to Gmelin or Hay's tests. The stools were not decolorized. The blood serum contained bilirubin, but not bile salts. The spleen was about four fingerbreadths below the costal border. The liver, heart, and lungs were normal. The blood contained about 2,000,000 red cells, the leucocytes varied between 8,700 and 10,200, the differential count being practically normal. The size of the red cells was below the normal. At the *post-mortem* examination the spleen weighed 850 grams, was rather firm, but not sclerotic. On section it was of a blood-red colour, remarkably homogeneous in appearance, and the Malpighian bodies could not be seen. The liver weighed 1,450 grams, and was normal in appearance; the bile passages were healthy, as were also the digestive tube, pancreas, heart, lungs, kidneys, and suprarenals. Histological examination of the spleen showed enormous congestion of the splenic pulp. The Malpighian bodies were normal in appearance, with the exception that the central arteries showed here and there thickenings of their walls. There was no sclerosis. The engorged splenic pulp was found traversed here and there by large and enormously dilated sinuses filled with blood cells. The essential fact appeared to be that the congestion was more marked in Billroth's cords than in the sinuses themselves. The former were enormously dilated and engorged with red cells and were traversed by fine connective tissue strands. The macrophages did not appear to be very

active and contained only a small amount of iron pigment. In the sinuses the macrophages were much more active, the cells being swollen and vesiculated and engorged with iron pigment and, in some places, with nuclear debris. Around these cells were seen masses of cell debris. In the greatly-dilated sinuses were to be seen mononuclear cells filled with pigment and the macrophages here were also filled with pigment. A mesenteric gland which was examined was found to be very congested. The medulla of a rib was in a very active condition, showing large numbers of nucleated cells undergoing karyokinetic changes. In the liver there was found an enormous amount of iron pigment in the hepatic cells. This pigment was in the form of large granules. The cells of the peripheral zone were more affected than the others. The larger number of the hepatic cells were of irregular shape, atrophied, and isolated from one another. Fatty changes were not marked. The kidneys showed iron pigment in some of the cells of the convoluted tubes. In the suprarenal capsules it was noted that the pigment in the reticular portion was not very abundant. As the authors point out, these facts indicate rather a blood disease than a liver affection and the anatomical changes found coincide with the changes found in a case described by Oettinger, Bouvoisin, and Flessinger. In the case of the authors a portion of the splenic pulp was injected intraperitoneally into guinea-pigs, with a result that an almost immediate red cell destruction and leucocytosis occurred, followed by a relatively slow blood reparation; and on examining the organs of the guinea-pig after death there was found an enormous splenic siderosis, without liver siderosis, together with a hyperplasia of the bone marrow. These facts clearly show, as the authors point out, that the splenic pulp has a haemolytic action, but there is no evidence to show that in these cases the spleen had any special haemolytic action. In conclusion, the authors consider that the sequence of events in their case may be considered as follows: A primary change in the blood, changes in the spleen and liver being secondary, and the change in the bone marrow being of a reactionary nature.

236. Acute Dilatation of the Stomach.

R. C. KEMP of New York, in a reprint from the *American Journal of Surgery*, November-December, 1908, discusses the anatomical and clinical types of acute dilatation of the stomach from the point of view of symptoms, prophylaxis, and treatment. In order to discover the effects of acute dilatation of the stomach upon the heart and respiration, two experiments upon dogs were conducted, artificial dilatation being produced, and the respiratory and blood-pressure changes noted. In these physiological experiments, however, the conditions are artificial and altered by the anaesthesia, and they are instructive rather from their negative than from any positive deductions. Four anatomical types exist—namely, acute dilatation of the stomach alone; acute dilatation, supervening upon a pre-existing chronic dilatation; acute dilatation of the stomach and duodenum, which is the most fatal form; and a mixed type of acute dilatation of the stomach with the intestines (tympanties). In this latter, frequently met with in the acute infections, a fact that is frequently lost sight of is that the tympanties is due to this mixed condition, and treatment directed to the intestine alone may be without result, whereas the acute distension of typhoid with active haemorrhage, for instance, may be relieved by lavage. Seeing that such tympanties is due to a systemic infection or to dietetic errors, it seems absurd to imagine a selective action for the intestines alone. Prophylactic measures consist in rapidly in operating with a minimum amount of anaesthetic and of manipulation of the viscera, and care in feeding after operation, so that food is not given too frequently or in too large quantities, and, in the acute infectious diseases, typhoid fever, and pneumonia, the substitution of broths, strained soups of barley, rice, and gruel, etc., for the usual milk diet. The stomach should be immediately evacuated by lavage, as the pressure from its distension is a source of actual danger. Lavage should be carried out at regular intervals several times during the twenty-four hours, as the stomach tends to redden in many cases, and no food or drink should be given by the mouth. Rectal feeding must be continued for several days, and

thirst relieved by saline enemata, or even hypodermoclysis. Unless other symptoms contraindicate it, after washing out the stomach with plain water in which 2 oz. of milk of magnesia has been dissolved. 3 to 5 gr. of calomel in $\frac{1}{2}$ oz. of water may be inserted into the stomach before the tube is withdrawn. Of drugs, tincture of belladonna, 5 to 10 drops on the tongue, with strychnine hypodermically every four or six hours, may be given. Only second in importance in treatment is posture, the patient lying in an inclined plane with the head of the bed raised on blocks, and by this method in one case of typhoid the tympanic area in the thorax became lowered 4 in. In the acute gastro duodenal type the prone position should be adopted.

SURGERY.

237. The Intra-Abdominal Administration of Oxygen.

BAINBRIDGE (*Ann. of Surg.*, March, 1909) publishes the results he has obtained from experiment on animals, and also from clinical research, in regard to the utility of infusion of oxygen into the abdominal cavity in the following morbid conditions: (a) Tuberculous peritonitis with ascites; (b) after the removal of any kind of ascitic fluid; (c) in the final stage of a severe laparotomy, the object of the infusion in such a case being to control shock, haemorrhage, cyanosis, and vomiting. The author has made certain deductions from his laboratory experiments, some of which, however, he acknowledges are not in accord with those reached by other workers. Oxygen, he believes, is completely absorbed in the abdominal cavity. Its stimulating action on both the heart and the lungs is slight, and it has but little effect upon blood pressure: without being an irritant to the peritoneum or abdominal viscera, it stimulates, it is held, intestinal peristalsis. It has been shown by experiment, also, the author states, that abdominal infusion of the gas tends to bring round an animal quickly from deep anaesthesia. In a review of an extensive clinical trial of intra-abdominal infusion of the gas, the author states that though final deductions concerning the practical value have yet to be made, the experience he has already gained warrants some tentative conclusions. It may, he believes, be safely stated the intra-abdominal administration of the gas has a distinct field of usefulness in lessening shock, haemorrhage, and vomiting; in overcoming negative intra-abdominal pressure after the removal of large tumours, in preventing the formation of adhesions, and also after such have been broken down, of lessening the liability of their return, and in influencing favourably certain types of tuberculous peritonitis. In three cases of septic peritonitis in which the gas was introduced into the peritoneal cavity, promising results were obtained. In his description of the method of administration the author states that he uses the so-called pure gas warmed to a temperature of from 90° F. to 100° F. This is accomplished by passing it through a rubber tube from the tank in which it is compressed into a wash-bottle filled with hot water. From this bottle the partially warmed gas passes through a long exit tube coiled in a basin of hot water. This tube is connected with a piece of glass tubing, to which in turn is attached a piece of sterile rubber tubing, through which the gas is introduced into the abdominal cavity. In closing the wound in the abdominal wall an opening is left either at its upper or at the lower end for the introduction of the tube, which is secured by a purse-string suture in the peritoneum. The amount of oxygen to be administered depends upon the exigencies of the case. In instances of abnormal distension from ascites or tumour the girth of the abdomen should, it is suggested, be measured before the operation, and after removal of the fluid or the large growth, the cavity should be distended to about the same degree, but not beyond this, by the injection of the gas. When there is no abdominal distension, a crude yet practical test may be found by first determining that the liver is not adherent to the chest wall, and is of approximately normal size, and then administering enough gas to obliterate the hepatic dullness. The author is very guarded in his conclusions on the value of intra-abdominal infusion of gas in clinical work, the most definite report being that in some cases the condition of the patient at the time of operation was so bad, or the shock from the operation was so great, that the result without some such support as oxygen seemed to give would have been questionable.

238.

Ischaemic Contracture.

DERNIER (*Rev. d'Orthop.*, March 1st, 1909) discusses those cases of deformity (usually in the forearm) resulting from pressure in the course of treatment of fracture. He first deals with the pathology of the subject and shows that the ischaemia leads to coagulation of the myosin in the muscles, to destruction of a certain number of muscular fibres followed by retraction, added to this there are certain phenomena due to changes in the nerves. To prevent these unhappy accidents great care should be exercised in the treatment so as to be on the look-out for signs of undue pressure. If any such signs appear it is good after the apparatus has been removed to elevate the limb for some time, use massage and quick active and passive movements. Curative treatment may be operative or non-operative, in the slighter cases non-operative treatment (elevation, massage, hot air, etc.) continued for many months may do good, but in bad cases operative treatment is usually necessary. Thiosinamin injections have been tried, but without much success—forcible straightening under anaesthesia seems on the whole to do more harm than good. The two chief operative procedures are tenoplasty and resection of part of the diaphysis, in the one case the tendons are lengthened, in the other the bone shortened. The author's preference is for tenoplasty, but the figures are not conclusive either way (resection gave a good result 9 times out of 11—tenoplasty, 13 out of 15). The time taken over each operation is pretty nearly the same. Resection has been followed by pseudarthrosis. As to the time for operation the author does not advise waiting too long, he operates if some weeks of massage, etc., have given no result. In operating he prefers not to use the Esmarch bandage: the haemorrhage can easily be controlled. Post-operative treatment (massage, passive and active movements, hot baths, electricity) is essential and as soon as the operation wounds are healed all apparatus should be discarded. If there is reason to suppose the nerves are injured or involved in scar tissue, these can be attended to at the operation. The author gives brief details of 97 cases reported from various sources.

239.

Aneurysms of the Hepatic Artery.

VILLANDRE (*Arch. Gén. de Chir.*, Nos. 1 and 2, 1909) gives a lengthy review of the pathology and clinical characters of aneurysm of the hepatic artery, and discusses the prognosis of surgical intervention in the treatment of this obscure and grave lesion. Aneurysm of the hepatic artery, the author points out, is a very rare affection, the cause of which is an acute arteritis of infective origin, and a sequel in most instances of pneumonia or enteric fever. It develops in the form of a tumour, the size of which is of less import than its tendency to invade and disintegrate the structures with which it is in contact, particularly the biliary passages. The sac usually ruptures into the excretory ducts, this phase being indicated by the symptoms of pain, frequently repeated haemorrhage into the digestive canal, and jaundice from retention. Rupture of the aneurysm into the peritoneal cavity is also a frequent termination of the affection. If left to take its course, hepatic aneurysm will inevitably cause death by more or less rapidly developed anaemia, and by hepatic insufficiency due to chronic jaundice. In considering the prospects of surgical intervention in cases of this kind the author acknowledges that from a physiological point of view ligation of the hepatic artery would seem to be impossible. Two cases, however, have been recorded—one by Tuffier, the other by Kehr—which, together with a pathological record by Ledieu, show that the hepatic artery may be ligatured or obliterated without causing total hepatic necrosis and consequent death. Such necrosis, it is pointed out, can be prevented only in those cases in which the artery has been gradually obliterated in the course of the development of the aneurysm, and the supply of blood has been maintained by a collateral circulation through the branches of the inferior phrenic and the gastric coeliac arteries. In the case treated by Kehr by combined cholecystectomy and ligation of the hepatic artery, the patient made a complete recovery.

OBSTETRICS.

240.

Laceration of Cord in Labour.

THREE cases of this condition have recently been reported. Lequeux (*Ann. de Gyn. et d'Obstét.*, March, 1909), at a meeting of the Société d'Obstétrique de Paris, read notes of the labour of a multipara. The ovum was expelled at term intact, and just before its complete extrusion from the genital canal the amnion was ruptured artificially and

the child extracted. It weighed $6\frac{1}{2}$ lb., and cried directly it was born. The cord was partially lacerated close to its placental attachment, one artery being torn through. The length of the cord is not stated. In this instance there was skilled help at hand, but Lequeux states that had the mother been delivered outside a hospital, and before medical aid could be obtained, the child would probably have died asphyxiated in its membranes or else have bled to death. The medico-legal point of interest was the fact that the cord was torn, the laceration involving a vessel by the natural expulsive forces alone. F. Unterberger (*Zentralbl. f. Gyn.*, No. 14, 1909) records two cases under his observation in the Rostock University Lying-in Hospital. The first patient was 27 years old and in her second labour; the previous labour had ended at term spontaneously. On this occasion pains set in at the end of the eighth month, and the fetal head presented in the second position. The pains were very strong, and the head was delivered five hours and forty minutes from the beginning of labour: it was then noticed that the cord was twisted twice round the fetal neck. Almost immediately another strong pain occurred, forcing out the shoulder and the whole body and tearing completely through the cord 83 in. from the fetal umbilicus. The torn ends were immediately ligatured. The placenta, which showed signs of calcification and held one infarct, followed eight minutes later. There was but little haemorrhage, and the perineum was not lacerated. The child was over 20 in. in length and weighed nearly 8 lb. The cord was 18 in. long, and held much Whartonian jelly. The second case occurred a few months later. The patient was a primipara aged 19, short and thin. Pains set in at the end of the eighth month, and were very strong; ten hours later the membranes ruptured spontaneously; the head presented in the first position. Forty minutes later the head was delivered, the cord was seen to be twisted once, very tightly, round the neck, and an attempt to disengage it failed. During the attempt a strong pain occurred, expelling the shoulders, and the tensely-stretched cord tore through completely within 4 in. of the umbilicus. The process was visible to the eye of the obstetrician, who, as in the first case, secured both ends of the cord at once. But little blood was lost before and after the expulsion of the placenta. The cord was 19 in. in length, poor in gelatinous tissue, and with much less marked spiral rotation than in a normal cord. The child, a female, was 20½ in. in length, and weighed $7\frac{1}{2}$ lb.; as in the first case it lived. The tissues of both cords were found to be sound, and the laceration was clearly due to their shortness and the strength of the uterine contractions. These cases prove that spontaneous laceration of a healthy cord may occur during a normal labour.

GYNAECOLOGY.

241. Broad Ligament Varicocele.

CAMUSSET (*Thèse de Lyon*, 1908-9) has collected seven undoubtedly authentic cases of this condition, which should be termed tubo-ovarian varicocele. It was once believed to be more frequent than further research has verified, haemorrhage from ruptured varices being far rarer than bleeding due to tubal gestation. The signs of tubo-ovarian varicocele are never well defined. There may be sharp lancinating pains, or obstinate menorrhagia, or habitual abortion independent of any evidence of syphilis or traumatism. The most positive symptom, the presence of a soft compressible swelling in the region of the appendages, is rarely present or, rather, is easily overlooked, yet Budin laid stress on it. Diagnosis is seldom if ever accurate. The causes of varix are not clear, most likely the anatomical course of the ovarian veins and changes in their walls favour its development. Camusset advocates a conservative operation, direct ligation of the dilated veins in young women, especially nulliparae. Each vein should be carefully tied, and when all are secured the varicose mass may be removed. In old subjects, in multiparae, and in all subjects where the uterus and appendages are also the seat of other diseases, radical operative treatment is indicated. Medication is of no avail.

242. Intestinal Obstruction from Necrosis of Fibroid in Pregnancy.

SPIERANSKY-BACHMETEFF (*Zentralbl. f. Gynäk.*, No. 16, 1909) attended a patient who was attacked with very definite symptoms of intestinal obstruction late in her first pregnancy. There was a pedunculated fibroid attached to the left cornu; it was observed to grow steadily during the pregnancy. The obstruction seemed to be situated in the left iliac region close to the growth. At length tympanites

developed; enemata proved of no avail, and the patient suffered badly from vomiting. Professor Ott made use of the endoscope, and located the obstruction at the junction of the descending colon with the sigmoid flexure. Pains had set in and labour was induced, but the obstruction was not relieved. Ott operated. The transverse colon was found greatly distended and hyperaemic; on raising it the pedunculated fibroid was exposed. It was intimately adherent to the great omentum, which was detached and carefully resected. Then the fibroid was found to be strongly adherent to the large intestine at the point already defined by Ott. In separating the gut its serous coat was damaged, exposing the muscularis; the raw surface was closed with fine sutures. The pedicle of the fibroid, which was short and thick, was excised at its insertion into the fundus. The vermiform appendix, being inflamed and adherent to surrounding structures, was excised. The patient made a good recovery. The tumour showed hyaline degeneration, and the necrotic process so often described by recent observers. Its surface had become inflamed and adherent to the bowel, on which it dragged more and more as the uterus enlarged, and rose upwards during the progress of gestation.

THERAPEUTICS.

243. Treatment of Stricture of the Urethra.

IN discussing the treatment of severe forms of urethral stricture, J. Cohn agrees with Henry Thompson that dilatation remains the proper procedure (*Berl. klin. Woch.*, January 25th, 1909). Even when several strictures are present in one urethra, dilatation may lead to a clinical cure, and the patient will be able to pass his urine without difficulty, and all inflammatory infiltrations will be removed. From a practical point of view the surgeon has to determine what instrument he should use for the dilatation, how long the instrument should be left *in situ*, and how often it should be passed. He described cases in which ordinary dilatation was not possible, which show how difficult cases may be dealt with. In one case the patient, who had suffered from gonorrhoea for the first time twelve years previously, and for the last time six years previously, noticed that his micturition was becoming difficult for about two years. The stream was small, and considerable pressure had to be employed. On passing a sound a dense stricture was felt some 10 cm. from the orifice. A No. 11 (Continental) bougie passed through. As the patient had a dislike to catheterization, Cohn injected a 15 per cent. solution of thiosinamin in alcohol subcutaneously every two days. A sound was passed every fortnight, but no improvement was seen. He therefore gave up the thiosinamin after twenty-five injections, and proceeded to dilate with soft bougies. No. 22 having been passed, he reverted to metal instruments, until No. 26 passed easily. Urotropin and silver nitrate sufficed to clear up the turbidity of the urine, and the patient was then able to pass his urine in full stream without difficulty. The second patient had had gonorrhoea first ten years before, and for the last time four years previously. When admitted there was retention of urine. A Nélaton No. 20 could not be passed. With some difficulty he passed a silk web catheter, and emptied the bladder. (The sizes given are the Continental numbers—No. 20 is between the English 11 and 12.) Cohn then tried the effect of fibrolysin injections but without appreciable effect. After a time he succeeded in passing a No. 15 bougie, and by gradual dilatation he was able to pass a No. 24, both in soft bougie and as a metal sound. Several authors have reported favourably on the injections of thiosinamin and fibrolysin, but he has never seen any good follow the injections. The next case was one of a stricture of the pars cavernosa. Bougie No. 12 could not be passed, while No. 10 passed readily. He then dilated up to No. 18, but after this not only could he not get a larger instrument to pass, but he found that even No. 14 would not go through the stricture. Ten grams of a 1 in 1,000 adrenalin solution were therefore injected into the urethra and allowed to act for some minutes. On trying again he had no difficulty in passing No. 19. The patient was dilated up to No. 26 (that is, English 15), and discharged with a normal urine stream. The fourth case was more complicated. The patient complained of difficulty in passing urine. On pressing heavily, a few drops of turbid urine were passed. A bladder sound passed smoothly as far as the bulbous, but could not be induced to pass beyond. Even a filiform catheter would not pass. Some lukewarm oil was injected, and a filiform bougie was then passed. Two days later the same process was repeated, but larger instruments could not be passed. As the patient was able to pass urine better he did not

present himself for two months. After the lapse of this time he came to hospital with complete retention. Not even a filiform bougie could be passed. Ten grams of a 1 in 5,000 solution of adrenalin solution was injected into the urethra, and a filiform bougie was then passed. This bougie had a screw thread at its end to which a catheter could be attached. The bougie was left *in situ* for twenty-four hours, during which time urine passed at the side of the instrument. Metal sounds were then screwed to the bougie, commencing with No. 14 (that is, somewhat larger than No. 7 English), and pushed into the bladder. After No. 18 (that is, No. 10 English) had been passed, both sound and filiform bougie were withdrawn and a silk web catheter was passed. This was left in the urethra for twenty-four hours, during which time the bladder was washed out with silver nitrate solution and boric acid solution. On removing the catheter a larger instrument was passed, until No. 23 was passed readily. The patient could pass urine without difficulty when he left the hospital. In a fifth case, he passed five filiform bougies as far as the stricture, and then tried to get one of them through the stricture. At length one could be directed through into the bladder, and the after-treatment was similar to the fourth case. After discussing several points in connexion with these cases, he turns his attention to cases in which no instrument can be passed at all. Under these conditions, external urethrotomy should be performed. When a stricture cannot be gradually dilated, or when for private reasons of the patient this course is refused, internal urethrotomy must be applied. He prefers Le Fort's method.

244. Injections of Extract of Tuberculous Glands in Tuberculosis.

LIVIERATO (*Rif. Med.*, March 15th, 1909) has carried out a series of experiments on guinea-pigs with a view to determine what influence injections of extract of tuberculous glands has on the evolution of experimental tuberculosis in animals of the same class. In Group A he inoculated the animal with tuberculosis, and then treated with tuberculous gland extract; in Group B he began by treating with gland extract, and some days later inoculated with tubercle; Group C were used as control animals. The animals in Group C all died within a month of infection, Group A within two and a half months, and Group B within three months. The animals of Groups A and B presented few tuberculous lesions (in some cases no naked-eye lesion), especially when compared with Group C, which died showing typical tuberculous lesions. The animals were inoculated by a single injection of 1 c.cm. of the emulsion in 10 c.cm. of a sterile physiological solution of a young (20 to 22 days) culture of living and virulent bacilli on potatoes. Control experiments with extract of normal lymphatic glands gave no protection against tubercle. The author does not feel warranted in drawing any definite clinical application from his experiments on animals at present, but proposes to continue his researches in his direction. The experiments do, however, suggest that scrofulosis—that is, an attenuated tuberculous gland infection—may, in a certain sense, act as a protective vaccine against the development of tuberculosis.

245. Lumbar Anaesthesia.

W. TOMASZEWSKI (*Deut. med. Woch.*, December 19th, 1908) records the results which he has obtained with lumbar anaesthesia in the Military Medical Academy of St. Petersburg. In all, 104 patients were subjected to the procedure, of whom 87 were males and 17 females; 120 operations were performed on these persons under its means. During the period of from October, 1905, to December, 1907, 60 per cent. of all operations on the lower half of the body were conducted in this way. Lumbar anaesthesia was not applied in cases of definite spinal cord disease, when marked nervousness or hysteria was present, in operations for which no plan could be made beforehand and which were expected to last a long time, to entail great difficulty and possibly create an unfavourable impression on the mind of the patient if awake, for operations which necessitated much raising of the pelvis and for operations deep down in the peritoneum. The ages of the patients varied between 14 and 65 years. In 6 cases—that is, 5 per cent.—no anaesthesia was induced; in 6 further cases the anaesthesia was incomplete. No unpleasant or threatening symptoms were met with. In one case, in a small patient in whom 0.1 gram of tropacocaine was injected, the anaesthesia reached up to the line of the nipples. Two hours after the operation the patient complained of feeling of oppression, and there was pallor and cyanosis of the face and lips. This passed off after twelve minutes. The dose was obviously too high. In

another case, a large quantity of cerebro-spinal fluid was accidentally allowed to drain away, and a severe headache lasting three days followed. Headache of short duration and some retching was seen in a few cases. The average duration of the anaesthesia was seventy-one minutes, while the average duration of the operation was forty-four minutes. In 15 per cent. of the patients, affections of the vascular system or lungs were present, but in no case were these affections rendered worse in any way. He used tropacocaine exclusively, and injected from 0.05 to 0.09 gram into the lumbar canal at first by means of Bier's syringe and later by means of a syringe designed by himself. The drug was dissolved in the cerebro-spinal fluid. Scrupulous asepsis is required not only with regard to the skin, instruments, etc., but also with regard to the tropacocaine itself. In 40 per cent. of his patients no changes were found in the urine, while in 60 per cent. traces of albumen, detectable by means of Spiegel's reagent, were met with. The albuminuria cleared off in from one to three days. Severe nephritic changes are, according to the author, extremely rare. In this respect, tropacocaine applied by lumbar injection is preferable to chloroform inhalation. He regards tropacocaine as the safest and best lumbar anaesthetic.

PATHOLOGY.

246. The Serum Diagnosis of Syphilis.

HIDEYO NAGUCHI (*Journ. of Exper. Med.*, March, 1909) has devised a simplified method for the serum diagnosis of syphilis. It is based upon the same principle as Wassermann's, and utilizes the Bordet-Gengou phenomenon of complement fixation to determine the presence of the syphilis antibody in a given specimen of blood serum or cerebro-spinal fluid; but it differs from the Wassermann method in using an antihuman haemolytic system instead of an antishape haemolytic system. The following reagents are required for making a test by the author's method. (1) *Antihuman haemolytic amboceptor*, prepared in rabbits by injecting them five or six times into the peritoneal cavity with increasing doses (up to 20 c.cm.) of washed human blood corpuscles, allowing five days' interval between each injection. The serum is collected from the immunized animal eight or nine days after the last injection. (2) *Complement*.—Fresh guinea-pig serum. (3) *Antigen*.—Alcoholic extract of organs or crude preparations of lecitin. (4) *Suspension of human blood corpuscles*, prepared by mixing one drop of the blood of a normal person with 4 c.cm. of physiological salt solution. (5) *The serum to be tested*. About 10 drops of blood from a patient are collected in a small test tube, and the clear serum obtained is employed for the test. The author has found that further modifications may be introduced into this method for the purpose of simplifying its use in the clinical laboratory. These modifications consist essentially in drying the reagents on paper and standardizing them. The antihuman haemolytic amboceptor, the guinea-pig complement, and the antigen, when dried and standardized on filter papers, can be kept indefinitely at room temperature in a dry place. In employing the filter paper slips, they are dropped by means of forceps into the test tubes already containing the human-blood suspension and patient's serum. It is necessary to shake the tubes a few times at intervals in order to ensure proper solution of the reagents. The incubation may be carried out perfectly well in the test pocket if a thermostat is not at hand. Naguchi has examined 465 samples of serum by his new method, and has at the same time examined 115 of these by the original method of Wassermann. This comparison gave the following results: Of 7 cases of primary syphilis the Wassermann test was positive in 5, the new test in all. Of 27 cases of manifest secondary syphilis the Wassermann test was positive in 23, the new one in all 27. Of 12 cases of latent secondary syphilis the Wassermann test was positive in 6, the new one in 9. In 18 cases of manifest tertiary syphilis the two methods agreed; and were positive in 17. Of 18 cases of latent tertiary syphilis the Wassermann test was positive in 11, the new one in 14. Out of 11 cases of testes dorsalis only 3 were positive to the Wassermann test, but all were positive to the new test. Out of 28 cases suspected of syphilis or of syphilitic origin the Wassermann test gave positive results in 16, the new method in 21. The causes of the observed differences, in certain cases, between the results of the two tests were found to be the existence of a large amount of natural amboceptor for sheep's blood corpuscles in those particular specimens of human serum.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

247. The Heart during Early Convalescence from Acute Infectious Disease.

BEVERLEY ROBINSON (*Amer. Journ. Med. Sci.*, December, 1908) points out that in such diseases as enteric, diphtheria, influenza, pneumonia, and scarlet fever, the heart muscle and the nerves governing heart action are usually organically affected if the disease be at all severe or last its usual period. Cloudy change and fatty degeneration, both of heart muscle, and nerve fibre, may be found; numerous lymphoid cells may be present in the interstices of the cardiac muscle fibres; the muscle fibres may be granular or fatty, and striation obscured. The cardiac muscle degeneration may be general or localized. Sometimes at a late period of the disease the heart muscle may be found hyaline or even fibrous. Fatty infiltration of the cardiac nerves and cloudiness of nerve sheath and irregularity of axis cylinders are not uncommon at autopsies. The heart is flaccid, the walls thin; occasionally there may be hypertrophic dilatation. The muscle is easily torn, and of a yellow or reddish-brown colour. Endocarditis and pericarditis are rare. Thrombi may be found, especially in the right heart. In some cases there is dilatation of the cardiac chambers, but no lesion of the cardiac muscle can be found, nor indeed any organic cardiac lesion. The author points out that it is fair to assume that during life, in minor degrees at least, similar pathological conditions exist even after the acute stages of the disease are passed and the patient has entered the period of convalescence. When, therefore, is it safe to allow such a patient to sit up, get up, take exercise, etc.? In typhoid fever the author believes that as a rule it is unwise for the patient even to sit up in bed until a week or ten days have elapsed since the temperature became normal. He should not leave his bed until he has sat up in bed several times at least, and this without the heart's action or the pulse-rate being much increased in rapidity. If sitting up in bed causes rapid action, irregularity, or intermittency of the heart, great caution should be observed, and if, in addition, there is a soft blowing mitral murmur, with perhaps an accented pulmonary second sound, or if the first sound lack tone, the patient is safer on his back than even sitting up in bed. If blood pressure estimations show a more than moderate difference between pressures whilst the patient is lying flat on his back and when he is sitting upright in or out of bed, we should absolutely forbid any physical or mental exertion. If the patient's temperature be subnormal, he should not be allowed out of bed. If the urine, which was previously normal, becomes lessened in quantity and its specific gravity becomes very low, the author objects to his patient getting out of bed. If, instead of increased rapidity of pulse-rate, the pulse becomes markedly slowed, one should be on the look-out for attacks of sudden heart failure. The author points out that, in convalescence from acute disease, such as typhoid, the possibility of fainting attacks or of cardiac dilatation occurring may exist for weeks, months, or years, and such cases must be watched with the greatest care and patience—time, with proper hygienic conditions of pure air, pure food, proper rest, recreation, and many hours of sleep in the twenty-four, will bring the patient out as well as ever. Of drugs, the most suitable are straphanthus, by the mouth or hypodermically, followed immediately by brandy, whisky, or ammonia. Subsequently strychnine, coca, or digitalis may be employed. In the later convalescent period of certain cases of influenza and typhoid fever the author thinks the Naheim method of treatment is often of great value. In instances of sudden heart failure occurring during the early convalescence of acute infectious disease, suprarenalin or adrenalin by mouth in $\frac{1}{2}$ grain dose, or preferably hypodermically in solution 1 in 1,000, is very useful. The author insists most emphatically on the necessity of securing complete physical and mental rest to these patients, which may need to be continued for many weeks. In scarlet fever the nephritis of the third or fourth week throws a strain on the already weakened heart, and dilatation is occasioned. If during the scarlatinal nephritis marked rheumatic manifestations are added, we should guard against endocarditis or pericarditis by employing the icebag or hot water bag to the precordial region, and give salicin internally. In croupous

pneumonia we should guard our patients against blood clotting by administering citric acid or ammonium carbonate. For the poison of influenza the author thinks quinine or compound tincture of cinchona valuable. As the author points out, the prognosis of a given case during the early convalescent period must depend upon the previous health of the patient, and especially upon the previous condition of his heart. If the patient be young, and hitherto well, the prognosis is usually fairly good, even although the infectious disease has been of a severe type. In patients near or past middle life we should be more anxious, especially after pneumonia or influenza, as there may have been pre-existing myocarditis or valvular disease, which may have been present, together with a myocarditis.

248. Tuberculosis in Children.

FLOYD AND BOWDITCH (*Archives of Pediatrics*, March, 1909) give the results of a systematic examination of 1,000 families in which tuberculosis had shown itself. This investigation was subsequent to the notification of the disease which has been in operation in Boston for four years, and thus incipient cases were discovered. In their experience the death-rate decreased as the age of the children increased. Predisposition was hereditary. Tuberculosis developed when children were living under defective hygiene; measles, whooping-cough, and influenza predisposed; and intimacy of the children with infected persons was a frequent cause of the disease spreading—39 per cent. of the children thus exposed to infection showed definite signs of pulmonary consolidation; 50 per cent. of the infected children had enlarged tonsils, but only 14.5 per cent. had adenoids. Of the 679 children infected, only 11 had glandular tuberculosis, and only 5 had bone infection; these cases, often known as the surgical type of the disease, must be of bovine origin, whereas the cases studied were those of human origin. In all but two cases the disease appeared as the adult type or chronic phthisis, and the two only was it general military in character. The first signs of the disease were languor, pallor, loss of strength and appetite; night sweats frequent, rapid loss of weight, cough constant, but haemoptysis uncommon. Slight evening pyrexia was most significant. The disease was frequently associated with asthma. The authors consider that the use of tuberculin subcutaneously is the most accurate diagnostic means we have: it not only reveals the presence of tuberculosis, but also often indicates where the process is located. With the cutaneous reaction there were rarely constitutional symptoms and no dangers: it is generally reliable. The ophthalmic reaction was sometimes useful, but 3 cases of phlyctenular conjunctivitis occurred and so the tuberculin test was generally preferred. In 14 cases the cutaneous reaction was negative and the ophthalmic positive. Of 73 children with no signs 30 gave a positive reaction to tuberculin; in 174 suspected cases, 112 gave positive reaction. The authors found the x-rays useful and often proved the disease to be more extensive than a physical examination would suggest. The prophylactic means suggested to combat the spread of tuberculosis in children are: Early notification of all births; better inspection and control of milk supply; systematic school inspection; housing reform; segregation of advanced cases; notification of the disease; provision for the care of phthisical children; education of all school children in hygiene.

SURGERY.

249. Surgical Treatment of Cerebellar Tumours in Children.

BERTHAUX AND BURNIER (*Arch. gén. de Chir.*, Nos. 1 and 2, 1909) hold that operative treatment is indicated in cases of tumour of the cerebellum in childhood when symptoms of cerebellar localization presenting the signs of the common syndroma of intracranial tumours have been observed. It is acknowledged that a precise topographical diagnosis is often very difficult in such cases; but this, the authors suggest, is a further indication for exploratory intervention. The rapid evolution of optic atrophy renders it advisable not to persist for long in the medical treatment of a supposed growth in the cerebellum. Posterior craniectomy, unilateral or bilateral according to the extent

and situation of the tumour, should, it is stated, be performed in two stages, the first operation for making a breach in the cranial wall being followed, after an interval of four or five days, by incision of the dura mater, by exploration of the cerebellum and the posterior cranial fossa, and finally, if practicable, by extirpation of the tumour. In 17 out of 49 collected cases of cerebellar tumour in childhood, craniectomy, it was reported, had resulted in cure. The authors of this paper, while doubting the completeness of the recovery in all these cases, believe that the results on the whole are very encouraging in face of the difficulties of the operative treatment and the malignancy of some forms of cerebellar tumour. It is stated that in more than a half of this number of cases the operation had been long delayed after the first appearance of decided symptoms. Better results, the authors hold, will be obtained from a deep and widely-spread conviction amongst surgeons that cerebellar tumours are malignant and operable affections.

250. Thrombosis of the Cavernous Sinus.

JACKSON (*Ophthalmology*, January, 1909) says that thrombosis of the cavernous sinus arises without sepsis as the result of general blood conditions. Septic thrombosis occurs by extension from the other cerebral sinuses, from otitic disease, from the nasal sinuses, from furunculosis, and by infection from diseased lids or orbital contents. The signs are almost entirely ocular, the chief being pain, oedema of the lids, chemosis, and extreme exophthalmos. A moderate degree of optic neuritis may be present, and venous engorgement is common. Vision may or may not be impaired. The condition usually spreads to the other eye by way of the circular sinus, this is pathognomonic of the disease. The author does not discuss treatment, which is purely surgical; if the cavernous sinus be not drained, an operation described by Dwight as by no means very difficult, death is almost certain in septic cases. The sinus is exposed by an operation similar to Rose's method of exposing the Gasserian ganglion.

251. The Operative Treatment of Papillo-Oedema.

DE SCHWEINITZ and HOLLOWAY (*Univ. of Pennsylvania Med. Bulletin*, January, 1909) publish observations upon the operative treatment of papillo-oedema (choked disc), more especially by decompressing trephining, and from their own experience and that of others this operation, with the removal of the growth if possible, is regarded as affording the most satisfactory treatment for the purpose of preserving vision in all cases not due to a toxic or constitutional disease, but depending upon increased intracranial tension. The importance of early interference is insisted upon, since the prognosis is most favourable in the first, second, or third stage of the condition, and good vision must not be regarded as a reason for delay, since in the very earliest stages processes may have begun which unchecked would lead to degenerations of the nerve and ultimately to blindness and atrophy. Should, however, the operation have been postponed until the fourth or fifth stages, operation is indicated, for, although the prognosis as to sight is then unfavourable, there is the chance of preserving such vision as remains, while without it blindness is a certain result. As to whether it is possible to detect a commencing papillo-oedema prior to the first stage, ophthalmoscopic examination cannot alone be relied upon, but a careful investigation must also be made of the visual field, colour perception, light sense, size of the blind spot, etc.; but the difficulties attending such early diagnosis are increased by the fact that an incipient papillo-oedema may be masked by a corresponding general retinal oedema or be extremely hard to distinguish from a simple hyperæmia. In spite of occasional unfavourable results, patients with papillo-oedema dependent upon increased intracranial tension should be urged to submit to operation, since without such interference blindness is sure to result. Twenty-one cases of cerebellar tumour, or cyst, and 22 cases of cerebral tumour, cyst, or abscess, were investigated, of a few of the more illustrative of which short notes are given.

252. Decompression in Choked Disc.

ROBINSON (*Ophthalmology*, January, 1909) reviews our present knowledge of choked disc, which he defines as "optic neuritis due to tumours, etc., of the brain." It is always associated with rise of intracranial pressure. This is communicated to the sheath of the optic nerve, and causes a lymph stasis; the veins get compressed, and congestion of the papilla ensues. The author agrees with Horsley that these cases should always be decompressed to save the sight, even when the primary disease must of necessity be fatal.

1188 B

OBSTETRICS.

253. Symphysiotomy and Hebosteotomy.

RUNGE (*Berl. Klin. Woch.*, December 13th, 1908) prefers pubiotomy, more recently called "hebosteotomy," to symphysiotomy. Hebosteotomy was first practised by Gigli with a saw of his own design. In the open operation, which differs in technique from the subcutaneous, the os pubis is laid bare by a transverse cut through the soft parts; Gigli's saw is guided by means of the fingers passed round the bone, which is then sawn through. Bumm and others, carrying out an entirely subcutaneous operation, pass a specially constructed bent needle between the labia major and minor, two fingerbreadths from the clitoris, close to the descending ramus of the os pubis. The index finger of the other hand controls the advance of the point of the needle from outside the vagina. After emerging above the os pubis near the pubic hair, Bumm's modified saw is hooked into an opening in the needle. This is drawn back with the saw and the pelvic bone sawn through. The open method is more complicated and carries greater danger of infection, but hæmorrhage is more readily arrested than in the subcutaneous operation. The latter is technically very simple and may be carried out in private, asepsis being almost guaranteed. The wound may be merely dabbled with collodion or a light bandage applied, but in the open method greater care is needed. A hæmatoma in the course of the puncture track must be avoided by a vaginal tamponade and a firm pressure bandage, which is indispensable for the first twelve hours. Later less stress is laid on absolute rest, as, with slight movability of the divided bones, the scar is less firm and more lasting expansion of the pelvis is attained. Most authors believe that bony union replaces connective tissue after the first week. In hebosteotomy considerable tears of the vagina may be caused by the sharp ends of the bone during the passage of the head; others may be due to rigidity of the soft parts, and would probably occur apart from the operation. Some injury of the vagina and bladder may be avoided by pressing the thighs together to prevent the pelvis gaping too wide during the passage of the head. Punctures of the bladder caused by the hebosteotomy needle heal almost spontaneously, and hæmorrhage from the corpus cavernosus is usually readily controlled. The space between the divided ends of the bones averages two to three fingerbreadths. Permanent widening depends on whether a broad callus or connective tissue scar forms. Hebosteotomy should only be undertaken after exact observation of the course of labour has shown that the child is viable and less dangerous methods are impossible. In primiparæ Bumm performs Caesarean section to avoid damage to the soft parts caused by hebosteotomy. The latter he employs in cases of contracted pelvis, where the conjugata vera is not less than 6.75 cm., or in cases of normal pelvis with a giant child. After the operation, which should be undertaken on that side on which the occiput is expected, immediate delivery is often indicated, and forceps should usually be applied. Comparing it with symphysiotomy, the degree of pelvic contraction is the same. The technique and after-treatment of hebosteotomy are simpler, healing of the wound surer, and danger of infection less. After subcutaneous hebosteotomy one can wait with far better conscience for spontaneous delivery than in the case of symphysiotomy, and it may be carried out in cases with fever, where, Zweifel says, symphysiotomy is contraindicated. The power of walking is regained much earlier in hebosteotomy. It may be practised by an experienced accoucheur, with good assistance, in a private house, which is practically impossible with symphysiotomy.

254. Detachment of Cervix and its Influence on Subsequent Labours.

GILLES (*Comptes Rendus de la Soc. d'Obst. et de Gynéc. et de Pédiatr. de Paris*, etc., January, 1909) followed up the case of a patient who became pregnant five times after this grave accident had occurred in the course of her first labour. On that occasion, in October, 1900, the membranes ruptured prematurely, and the forceps was applied on account of rigidity of the os and lingering labour. In the course of extraction the vaginal portion of the cervix was completely torn off. The child weighed over 7 lb., and was saved; the curette had to be used, and the patient not only recovered but became pregnant for a second time, and was delivered at term—fourteen months after her first confinement—in December, 1901. Labour lasted 7 hours 15 minutes, the fetal head dilating spontaneously the false os, which had thick, irregular borders. The placenta was expelled by expression. The child weighed nearly 6 lb.

The third labour occurred in August, 1903, in the ninth month. The membranes ruptured prematurely, as in the previous and all the succeeding labours; yet labour ended spontaneously in five minutes, and the child, which weighed less than 5 lb., was living. The fourth labour occurred in March, 1905; the patient had become pregnant without any menstrual period appearing after the last pregnancy. Labour lasted half an hour, and the child, weighing over 6 lb., was delivered spontaneously. The fifth labour occurred in May, 1906, in the eighth month; delivery was spontaneous and very speedy; there had been hydramnion; the fetus weighed a little over 4 lb. The sixth labour—the fifth after the circular detachment of the cervix—occurred in March, 1908, in the eighth month. As before, the membranes ruptured early, the presentation was vertex, and the circular orifice, which represented the os externum, still had thick borders. Labour lasted three hours, ending spontaneously, and the child weighed 7½ lb.; a battledore placenta followed. This case showed how little, if at all, complete avulsion of the vaginal cervix might influence subsequent pregnancies and labours. Indeed, some of the labours in this case were unusually uncomplicated. There was some discussion, when Gilles's report was read, about the relative gravity as to future labours, of surgical and traumatic amputations of the cervix. The former had often a prejudicial effect, premature rupture of the membranes having frequently been noted.

GYNAECOLOGY.

255. Myoma of Vagina: Hydronephrosis.

HALBAN (*Zentralbl. f. Gynäk.*, No. 16, 1909) recently reported at a meeting of a medical society a case with a suggestive clinical history. A maiden lady aged 36 had undergone nephrectomy for hydronephrosis of the right kidney six years before she came under his care for dysuria, which had caused her much distress for several months. Blood had repeatedly been observed in the urine. The vagina was blocked by a mass as big as a fist, and the portio vaginalis of the cervix could hardly be reached by the finger. The mass was tough, tuberculous, not tender, and not freely movable. The mucosa of the anterior wall of the vagina was firmly adherent to its surface. The uterus, of normal size, was anteverted and quite distinct from the mass, which reached upwards to the superior border of the symphysis pubis. Halban made a deep incision along the vaginal wall, and enucleated the mass with ease. It was a tumour over ½ lb. in weight, a typical myoma free from any glandular elements. Halban was not sure whether it had developed in the tissues of the vaginal wall or in Gartner's duct. The base of the bladder was laid bare by the enucleation, and it was noticed that the right ureter was atrophied. The relations of the tumour accounted for the dysuria, and Halban believed that the hydronephrosis for which the right kidney had been removed might have been caused by pressure of the tumour on the corresponding ureter. He transpired that the vagina had not been explored when the kidney was extirpated; therefore Halban considered that the vagina and rectum should always be carefully examined in cases of renal tumour.

THERAPEUTICS.

256. A Malignant Neoplasm Treated by X-Rays.

At a meeting of the Medical Society of Munich, Mader reported the result of the treatment of a malignant new growth of the upper air passages by Röntgen rays, and demonstrated the result by showing the patient (*Muench. med. Woch.*, March 23rd, 1909). The patient was a man, aged 48 years. On December 3rd, 1907, he consulted a throat specialist on the advice of his practitioner on account of slight pain in the throat, difficulty in swallowing and some roughness in the throat. At first no objective signs were discovered, but after a few weeks a tumour was seen to develop low down on the posterior pharyngeal wall. There were no palpably enlarged glands. Iodide of potassium failed to bring about any improvement, and on January 25th, 1908, a portion was excised for microscopic examination. This proved to be a squamous epithelial cancer, and the radical removal of the tumour was undertaken two days later. On April 6th the growth had recurred and had become larger than before. Mader admitted the patient on May 7th. He found a tumour measuring about 4 mm. by 2 cm., situated low down on the pharyngeal

wall, close to the larynx. The surface was uneven, ulcerating, and covered with a sticky, purulent, greyish-yellow exudation. There was not much pain, but considerable difficulty in swallowing was experienced. No enlarged glands were felt, but the scar from the operation bound the tongue down to the side. The patient was treated in nine sittings by means of Mader's special pharyngeal Röntgen apparatus. Each sitting occupied from sixty to eighty minutes, and was made up of short exposures of from five to twelve minutes with short intervals between. A pause of about two weeks to allow the reaction to pass off was made before the next sitting was undertaken. The technical details of the treatment were: Induction coil, 40 cm.; Walter transformer, 110 volt current in front of the transformer; 1 to 2 amperes at a focal distance of from 8 to 10 cm.; slow mercury interrupter (from 200 to 300 in the minute), and tubes of varying hardness. After the fourth sitting the tumour was seen to be smaller. It had been growing steadily up to the time when the treatment was begun. After the eighth sitting the practitioner reported that after the swelling of the reaction had gone down scarcely any growth was to be seen. The ninth sitting succeeded in removing the last traces of a tumour, and the patient was in excellent health—had no pain or other symptom on November 25th, 1908. The rays were applied directly from the fauces. The rays were directed so that they could act intensely on the affected area. Mader does not give a description of the special tubes, as he demonstrated them at the meeting. From the text it appears, however, that the tubes are completely screened off, and the rays are only allowed to pass through a small window. The prolongation of the instrument is passed into the mouth and so directed that the window looks straight at the tumour. He compares his method with that of Hölst and Payenneville, and shows that the advantage of his is that the rays are directly applied, that no pain is produced, and that no anaesthetic is required; all of these do not apply to the French instrument. In dealing with the general question, he finds that x rays are only useful in a small number of laryngeal or faucial tumours. He believes that this treatment should only be employed under given conditions, and sets up an indication as follows: Operative treatment should be undertaken in all cases in which a chance of removing the whole growth is present, and in which the age and strength of the patient permits of the interference. X-ray treatment is permissible when it is doubtful whether surgical means can succeed, when the age and strength of the patient scarcely justify an operation, or when from any cause a considerable danger to life is produced by operation. He instances a case which he treated three years ago by x rays, and succeeded in causing the tumour to disappear. A small recurrence has recently taken place, which is at present being successfully re-treated by the same means. Lastly, x rays are indicated in all cases in which operative treatment is refused, when the condition is hopeless, or when a recurrence after operation has taken place.

257. Arsacetin in the Treatment of Syphilis.

G. HEYMANN finds that, although the value of arsenic in the treatment of syphilis has been recognized by most authorities, practically the only preparation of arsenic which has hitherto been extensively used is atoxyl (*Deut. med. Woch.*, December 10th, 1908). This drug has certain disadvantages, of which the following are put forward: (1) The mucous membrane of the intestinal tract is irritated and nausea and vomiting and diarrhoea are produced; (2) the uropoietic system is irritated, and nephritis, dysuria, etc., are produced; and (3) the nervous system is attacked, and giddiness, polyneuritis, and optic neuritis, followed by blindness, are produced. Ehrlich found, when experimenting with atoxyl in animals infected with trypanosomes, that among a number of derivatives of this substance arsacetin exercised at least the same curative properties and was considerably less toxic. Arsacetin is the (p) acetyl-amino sodium phenylarsanilate, is free from arsenious and arsenic acid, and is not dissociated by boiling. It is soluble in cold water to the extent of 1 part in 10, while hot water takes up 3 parts in 10. The injections are undertaken with a 20 per cent. solution into the gluteal muscles, 3 c.cm. being injected at each dose, equalling 0.6 gram of the substance. The solution has to be warmed before use to dissolve all the crystals, and the syringe and needle must also be warm, so that the substance is not thrown out of solution. Heymann has attempted to determine what curative power arsacetin possesses in syphilis in man and what its degree of toxicity is. He applied it in a number of cases of primary, secondary, and tertiary syphilis. In 20 out of 31 cases he

succeeded in obtaining a rapid and obvious curative action of the drug. Broad condylomata, papules on the mucous surface of the mouth, and various forms of rash were seen to disappear in a short time under its influence. On the other hand, although the total quantity used in the treatment did not exceed 7.2 grams, 6.0 grams failed to influence gummatous affections at all. The rapid beneficial influence in the above-mentioned cases, however, did not persist, and recurrences of the symptoms within a fortnight of discharge from hospital were met with. The repetition of the treatment, however, proved of no value, and mercury had to be employed in the recurrences. In 7 cases he found it necessary to interrupt the treatment on account of symptoms which pointed to intoxication. Headache, nausea, oliguria, albuminuria with blood and casts in the urine, giddiness, and pains in the abdomen and extremities were seen in these cases. In none of these cases did any bad effects persist on discontinuing the injections. He therefore comes to the conclusion that arsenacetin acts rapidly in influencing the symptoms for the time, but that this action is not durable. In 23.6 per cent. of his cases symptoms of intoxication compelled him to discontinue the application of the drug.

258. The Food Value of Eggs.

S. AUFRICHT AND F. EDJON (*Deut. med. Woch.*, No. 53, Jahrgang 34) find it a matter of surprise how few works there are dealing with the food value of eggs, the extent to which they can be absorbed, and their digestibility. Uffelmann carried out a series of observations, but his results were vitiated by the fact that his patient suffered from fever during the whole period. Penzoldt and Prager investigated the length of time for which eggs were retained in the stomach. If it be granted that the length of time for which food is retained in the stomach is a measure of its digestibility, lightly cooked eggs are the most digestible, next come raw eggs, then buttered eggs and finally hard-boiled eggs and eggs in an omelette. Such experimental data are not, however, conclusive as to the true food value of eggs. More effective investigation is that which includes the examination of the urine and stools of a person on an egg diet. Rubner experimented on a student, 24 years of age and weighing 46 kilos; on each of two consecutive days the student ate 42 hard-boiled eggs, with a weight of 1896.2 grams, a nitrogen-content of 41.5 grams, and a fat content of 206.7 grams. The amount of the nitrogen excreted in the urine or stools on both days was 45 grams. The percentage loss by the stools of nitrogen and fat was 2.9 and 5 per cent. respectively, as compared with 2.6 and 19.1 per cent. respectively on a meat diet. Thus, according to Rubner, the nitrogen of hard-boiled eggs is absorbed to about the same extent as that of meat, but the fat is much better absorbed than that of meat. More recently Lebbin has published results which are approximately the same as those of Rubner. The authors of the present article have made a series of experiments which are of greater practical interest than those described above, because in actual life no person is ever put upon a diet consisting solely of eggs. The authors' investigation lasted for a total period of seven days: the person experimented on—one of themselves—was for three days on a measured mixed diet; for the next two days the diet was altered only in so far that the meat—150 grams, containing 43.65 grams of proteid and 29.85 grams of fat—was replaced by 8 eggs which had been boiled for three minutes, and which contained 52.29 grams of proteids and 49.8 grams of fat. In the third period of two days the lightly cooked eggs were replaced by raw eggs. The mean daily nitrogen intake during the three periods was 11.35 grams, 12.73 grams, and 12.73 grams respectively. Of this the proportion of nitrogen which was not absorbed was during the three periods 5.22, 3.81, and 3.1 per cent. respectively, and the proportion of fat not absorbed was 14.39, 6.25, and 4.09 per cent. respectively. The mean daily loss of nitrogen was 1.273 grams, 1.535 grams, and 1.815 grams respectively. The mean daily nitrogen loss was thus proved to be proportional, not to the amount of nitrogen taken in, but to the amount absorbed. Both in the meat and in the egg periods the nitrogen was better absorbed than the fat. The absorption both of nitrogen and of fat was least in the meat period, increased in the lightly cooked egg period, and increased again, though only to a small extent, in the raw egg period. The practical lesson of these investigations would be that lightly boiled eggs and raw eggs have a higher food value as part of a mixed diet than a corresponding amount of meat, but that the superiority of raw eggs as compared with lightly boiled eggs has been much overvalued. Eggs deserve to be much used, both in disease and in health,

on account of the ease with which they are digested, their high food value, and the extent to which they are absorbed.

PATHOLOGY.

259.

Milk Anaphylaxis.

BESREDEKA (*Ann. de l'Inst. Pasteur*, February, 1909) finds that when guinea-pigs are sensitized to milk the intracerebral injection of milk ($\frac{1}{2}$ to $\frac{1}{4}$ c.cm.) produces the symptoms of anaphylaxis, with a fatal result in a few minutes. Unlike blood serum, milk does not lose its toxicity after heating to 100° C. It is still highly toxic at 120°, and its toxicity is not markedly diminished until the temperature exceeds 130°. The sensitizing power of milk submitted to temperatures varying from 100° to 130° exhibits the same gradations as the toxicity. Sensitization does not take place when the milk is administered per os or per rectum. Milk possesses a vaccinating power which is retained even after heating to 130° for fifteen minutes. The specificity of the anaphylactic reaction is not absolute for milks of a given kind; thus, guinea-pigs made anaphylactic with cow's milk react to goat's milk. The casein possesses sensitizing, vaccinating, and toxic properties, just like the whole milk. The whey sensitizes in some conditions, but not in others; it always vaccinates, and is never toxic. The active principle of the whey is contained in all probability in the substance usually called lactoprotein, which is easily reabsorbed in the intestine. Anti-anaphylactic vaccination is accomplished by administering whey or whole milk either per rectum or per os; it is rapidly effective, absolutely harmless, and does not sensitize.

260.

The Pancreas in Diabetes Mellitus.

R. L. CECIL (*Journ. of Exper. Med.*, March, 1909), from a study of the pathological anatomy of the pancreas in 90 cases of diabetes mellitus, arrives at the following conclusions: (1) Anatomical lesions of the pancreas occur in more than seven-eighths of all cases of diabetes mellitus. (2) When lesions are found, the islands of Langerhans constantly show pathological changes (sclerosis, hyaline degeneration, infiltration with leucocytes, and hypertrophy). (3) In some cases (12 out of 90) the lesions are limited to the islands of Langerhans. (4) In 16 cases associated with hyaline degeneration of the islands of Langerhans the average duration of the disease was three and a half years; and in 46 cases with sclerosis of these bodies the average duration was 3½ years. In 6 cases associated with an infiltration of leucocytes the average duration was eleven months. (5) Destructive lesions of the islands of Langerhans may be associated with compensatory hypertrophy of other interacinar islands. (6) Peculiar adenoma-like hypertrophy of the islands of Langerhans occurred in a small proportion of cases (7 out of 90), and were associated with adenoma of the thyroid gland in 2 cases, and of the pituitary body in one. (7) Diabetes mellitus occurring in association with haemochromatosis (bronzed diabetes) is referable to pigmentation and destruction of the islands of Langerhans. (8) In 12 per cent. of the cases the pancreas exhibited no distinctive pathological change, but in approximately one half of these instances it was noted that the size of the gland or the number of islands was much less than normal. (9) Fifty per cent. of cases of diabetes mellitus occurring before the age of 30 years are associated with lesions of the pancreas; 75 per cent. of all cases of diabetes in which the pancreas is normal occur before the age of 30 years; 97 per cent. of cases occurring after the age of 30 are associated with lesions of the pancreas, and 86 per cent. occur in association with chronic interacinar pancreatitis accompanying arterio-sclerosis. (10) Interacinar pancreatitis, which occurs in 73 per cent. of cases, is almost constantly associated with arterio-sclerosis, and gangrene of the extremities, which occurs with one-fourth of cases of interacinar pancreatitis, is referable to the same cause. (11) Chronic interlobular pancreatitis, when associated with diabetes, is accompanied by sclerosis or hyaline degeneration of the islands of Langerhans. (12) Diabetes in association with myxoedema or with exophthalmic goitre may be referable to a lesion of the pancreas—namely, chronic interacinar inflammation with sclerosis of the islands of Langerhans; diabetes in association with acromegaly may be referable to a lesion of the islands of Langerhans—namely, sclerosis and hyaline degeneration with adenoma-like hypertrophy.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

261. Intestinal Sand.

MYER AND COOK (*Amer. Journ. of Med. Sciences*, March, 1909), from a study of the literature and from their own observations in a case in which "intestinal sand" was a constituent of the faeces, do not consider it a clinical entity nor productive of any definite train of symptoms. The faeces in their case—that of a woman aged 24—were dark brown in colour, firm in consistency, and contained a little mucus and from 1 to $1\frac{1}{2}$ grams daily of fine granules resembling sand, which gradually disappeared after being present in the motions for a fortnight. The patient was constipated, and complained of great fullness of the abdomen, which was tense and slightly tympanitic. The right kidney was movable, and the stomach was in moderate ptosis but otherwise negative. There was no family history of gout or rheumatism. The sand-like granules were intimately admixed with the stool, gritty to the touch, translucent in appearance, and varied in colour from light yellow to the colour of uric acid crystals or garnets. A chain of such sand was found, together with two or three fibro-vascular bundles histologically identical with banana tissue. By the ingestion of bananas sand identical with that found in this case could be produced experimentally, being obtained from the faeces in teaspoonful to tablespoonful quantities after the ingestion of one or two bananas, and persisting in gradually diminishing amounts for several days. On treating a thin section of the banana with ferric chloride small masses of a garnet-coloured substance, each contained within a cell membrane, were obtained. In the stem as well as in the fruit there are milk tubes, consisting of a row of vertical cylindrical cells containing large homogeneous, highly refractive resin balls, suspended in a fluid rich in tannin. The secretions of the stomach and intestine act upon these similarly to the ferric chloride, hardening the resin and producing an insoluble tannate of sand, after digestion of the cell walls, is liberated as a grain of sand.

262. Tuberculous Cirrhosis of the Liver.

THE association of pulmonary tuberculosis with cirrhosis of the liver has often been noted in man, and also in rabbits or guinea-pigs infected with tubercle bacilli the liver is often cirrhotic. S. Isaac (*Frankfurter Zeit. f. Path.*, Wiesbaden, 1908, ii, p. 125) remarks that the cirrhosis is usually atrophic, although Hanot's hypertrophic cirrhosis has been recorded, and may simulate tuberculous peritonitis very closely. He details the case of a man of 45 who had had "fever" and syphilis in Java twenty years before, and early in January, 1904, had cough and fever. In March the cough had gone, but the fever persisted, and the patient's liver was enlarged. Rest in bed, iodide, and mercurial inunctions were prescribed, but the liver did not lessen. No history of alcoholic excess was obtained. In June the liver reached to within a fingerbreadth of the navel, its edge was sharp, its surface smooth; the spleen was much enlarged; the heart was hypertrophied; the lungs showed no abnormal physical signs. The morning temperature averaged 96°, the evening 102°; hepatic abscess was suspected, and an exploratory laparotomy was performed in July, 1904. The liver was found to be very large, soft, with a faintly-nodulated surface, but no abscess could be found by puncture; the spleen was six to eight times the normal size, and slight ascites was present. The patient left the hospital in September; for about six months he had had much cutaneous itching, latterly with an urticarial eruption; the lungs showed nothing abnormal. In October jaundice set in, and the pruritus was more troublesome. The fever continued, and puncture of the liver was tried, with negative result; antisiphilitic treatment was given several times, without improvement. In November, 1906, an effusion appeared in the right pleura, no evidence of pulmonary phthisis having till then been found. In March, 1907, the patient sank, dying at the end of June. At the obduction 5 pints of ascitic fluid were found in the abdomen; the great omentum was rolled up and adhered to the liver, and contained numerous small yellow-stained tubercles, as did the mesentery and peritoneum. The liver weighed 21 lb., and was extensively adherent to the diaphragm, smooth on the surface, deeply jaundiced, and showed no normal acinous structure; the

cut surface exhibited small areas 2 to 4 mm. in diameter separated by sunken fibrous septa, without any macroscopic caseation, and gave no amyloid reaction; the liver tissue was very tough, the kidneys showed many small yellow tubercles; the lungs showed extensive tuberculous lobular pneumonia, but no old tuberculosis. The spleen contained typical solitary tubercles, as did the bronchial glands. Microscopically the liver showed extensive destruction of the liver cells, much infiltration with small round cells, countless typical small tubercles in the acini and in the interacinar tissue, and a few newly-formed bile ducts in the parts where the inflammatory reaction and congestion were most marked; other parts of the liver showed mainly fibrosis. The bile ducts and vessels exhibited much inflammatory invasion of their walls. The fibrosis generally extended into the acini of the liver, only exceptionally being limited to the periphery of the lobules. Tubercle bacilli were freely found in the liver, both in the tubercles and in the aggregations of small round cells. Isaac regards the case as a primary haematogenous tuberculosis of the liver, running its course in three and a half years, associated with hypertrophic cirrhosis, and spreading to the lungs only a few months before death.

263. Mitral Stenosis and Congenital Malformations.

HEITZ AND SEZARY (*Arch. des Maladies du Cœur des Vaisseaux et du Sang*, December, 1908) report the following 2 cases of mitral stenosis associated with congenital malformations. The first case was a man of 48 who had been in good health until two years previously, when he began to suffer from shortness of breath, palpitation, and loss of strength and flesh. On examination of the heart there was evidence of dilatation of the left auricle to percussion and an increase in the extent of cardiac dullness, especially transversely. A diastolic murmur was heard, and the second sound was permanently reduplicated. In this patient it was noticed that there was a left-sided hemihypertrophy of the body. The left arm and leg were increased both in length and in thickness, and the left shoulder was larger than the right. The left hand was $1\frac{1}{2}$ cm. longer than the right, and the digits of the left hand were larger than were those of the right. The left great trochanter was in a higher position than the right and there was a certain amount of luxation of the left hip. The left leg exceeded the right in length by about 6 cm., and the circumference of the former exceeded that of the latter by from 1 to $1\frac{1}{2}$ cm. The left foot was longer than the right. The face, neck, and thorax were normal. The second case was that of a youth 17 years of age, who appeared much younger. His hair was poorly developed and his testicles were small. In this patient there was found a completely bifid uvula and an anomalous union of the two sides of the mandible. In the region of the symphysis menti were found two longitudinal projections separated by a very deep median depression. In this patient there were found signs of mitral stenosis—thrill, diastolic murmur, and reduplication of the second sound. The authors admit that the presence of congenital malformations, such as those described in association with mitral stenosis, does not prove that the mitral stenosis was of congenital origin, as the latter may have resulted from an infection in the early years of life. Still, in such cases as these, in the absence of any definite cause for the mitral stenosis, one should bear in mind the possibility of its being the result of conditions occurring during intrauterine life.

SURGERY.

264. Hepatic Cancer Mistaken for Abscess.

MICHELEAU (*Gaz. Hebdomadaire des Sci. Méd. de Bordeaux*, March 7th, 1909) relates the following case: The patient was a man of 34, very strong and robust until seven months before coming under observation, when he was suddenly seized with severe pain in the region of the left kidney, accompanied by haematuria, sufficiently profuse to form intravesical clots and subsequent retention of urine. The renal colic did not return, but the left kidney was somewhat painful as well as tender on pressure, and the haematuria continued for about two months, causing

anaemia, pronounced weakness, and very considerable emaciation. About the time when the pain ceased, or a little sooner, a rise of temperature was observed, about 102° even at the outset, sometimes preceded by rigors, and followed by profuse sweats. Renal tuberculosis was diagnosed by two surgeons, but Koch's bacillus could not be found in the urine. When seen by Micheléan he had been suffering from gastric disturbance for some days, the appetite being irregular, and the gastric region swollen and painful, with vomiting of mucus and of food, but without haematemesis or melaena. He had formerly suffered from haemorrhoids, which had ceased to bleed some time before his illness began. An operation on the kidney, which had been thought of, was abandoned because the symptoms had left the renal region for that of the stomach, and the aspect of the patient indicated marked cachexia, either from a serious suppurative process or from some neoplasm. The temperature oscillated round about 102°, with a morning remission of nearly two degrees; the pulse ranged between 100 and 110, and there was no marked sweating. The epigastrium presented a uniform tumefaction, extending to the right under the false ribs, which it pushed forward, the left side being free. There was spontaneous pain, dull and aching, but seldom acute, and there was no radiation, as, for example, towards the right shoulder. On palpation the pain increased so much that deep pressure was impossible, but a uniform smooth swelling was made out, apparently continuous with the liver, the lower border of which could be felt three fingerbreadths below the ribs, no fluctuation being perceptible at any point. No other organ appeared to be affected, and the diagnosis of liver abscess was made, probably on the inferior surface, as there were no radiations of pain towards the shoulder. This idea was encouraged by the fact of a past history of some malaria and dysentery, incurred on foreign stations during the seven years of his service with the fleet. Some more definite physical sign was sought for in vain: examination of the blood was not efficiently carried out, and as variations in the size of the liver hypertrophy seemed to point to an abscess, operation was decided upon. Exploratory punctures, under chloroform, revealed no pus, and the laparotomy was proceeded with. The internal half of the right lobe, corresponding to the external swelling, consisted of a lardaceous mass, very hard, almost woollen; and the diagnosis of cancer, not formerly thought of, became obvious. After some further futile punctures, the wound was closed. The incision healed by first intention, and no subsequent complication intervened, but the patient died ten days afterwards. It was ascertained later that a sister had previously died, at the same age, of general melanotic cancer, but there was no other item of family or individual history which would have thrown light on the true nature of the case, and Micheléan is of opinion that under similar conditions the same course should be pursued.

265. Momburg's Method of Compression.

MOMBURG made the suggestion that simple constriction around the waist would serve the purpose of controlling haemorrhage in operations on the hip-joint and other parts in or close to the pelvis, and by avoiding a compressing disc or pelotte no risks would be associated with it. G. Axhausen relates his experience of the method (*Deut. med. Woch.*, December 3rd, 1908). He applied the constriction when the patient was under the anaesthetic. He used a rubber tube doubled, and wound it twice round the body. The leg was raised before it was applied, and the tube was drawn tight until the femoral pulse could no longer be felt. The operation was a resection of the acetabulum and of the neighbouring portion of the pelvic bone as far up as the anterior superior spine of the ilium. The operation was performed bloodlessly. No difficulty was experienced in applying the compression, and no ill effects were seen during or after the operation. So far, therefore, the method has proved highly useful.

266. Mesocolic or Retrogastric Hernia.

W. J. MAYO (*Annals of Surgery*, April, 1909) reports 2 cases of the rare form of intra-abdominal hernia known as mesocolic or retrogastric, both of which came under his observation and were successfully treated by operation in the course of 1908. Notwithstanding the peculiarity of the conditions in these two instances, the lesions revealed by laparotomy were practically identical. The 2 cases, the author states, present points of interest not only on account of their rarity, but also because of the primary pathological condition which appears to have been the important factor in the production of the hernia. The hernia in each case was revealed by a median laparotomy practised for the relief of very severe and long-continued

gastric disturbance. In the first patient, a female aged 59, a large rent of the mesocolon was found, through which the small intestine, with the exception of its proximal 3 in. and its distal 12 in., and the whole extent of the mesentery had passed into the lesser sac of the peritoneum behind the stomach and out through a second opening in the gastropneumatic omentum. Each opening was about 5 in. in diameter, and the margins were round and smooth. In the subject of the second case, who was a female aged 32, about 5 ft. of small intestine had passed behind the stomach through an opening in the transverse mesocolon, carrying the peritoneum of the transverse mesocolon ahead as a sac, the firm ring of which was at the loop of the middle colic artery. In the first case the stomach was completely covered by small intestine; in the second case the organ, which was in front of the herniated intestine, was prolapsed and dilated so that it filled almost the entire abdomen and pelvis. After the performance of gastroenterostomy, which was indicated in both cases by duodenal ulcer, the cavity occupied by the small intestine was in each patient closed by suturing the margins of the opening in the mesocolon to the posterior wall of the stomach. Both patients, the author states in his comment on these cases, presented typical conditions of Glénard's disease. There was undoubtedly in each a primary prolapse of the stomach. The duodenal ulcer, which existed in both, had undergone a chronic perforation, causing adhesions and fixing the duodenum beyond the stomach, just as the cardiac end is held normally by the oesophagus. The obstruction in each case was extreme, the huge stomach hanging down in front of the intestines. The abdominal muscles exerted great force in the frequently repeated efforts to expel by vomiting the large accumulation in the stomach of undigested food, and caused compression of the intestines behind this viscus, which was confined at each extremity and much prolapsed in its middle part. In this way, it is held, pressure was brought to bear on the transverse mesocolon, upward in the line of least resistance, causing this peculiar form of hernia.

OBSTETRICS.

267. Cardiac Disease in Pregnancy and Labour.

HARRAR (*Bulletin Lying-in Hosp., City of New York*, September, 1908) writes that cardiac disease, with failing or lost compensation, occupies an important position among the complications of pregnancy and child-birth. While these broken-compensation cases are not half so numerous as those of placenta praevia or eclampsia, they occur twice as frequently as those of severe accidental haemorrhage. The situation presents a mortality for the mother which is appalling, and a fetal mortality greater than is generally supposed. It is not unusual to discover chronic valvular disease with perfect compensation in the ordinary routine examination of ante-partum cases. The etiology of the defect, as a rule, antedates conception. Leaving chronic endocarditis with compensation and no symptoms aside, the writer has collected a large number of cases of valvular disease, in which loss of compensation has occurred during pregnancy or labour, including those few instances of chronic endocarditis with symptom-free pregnancy, in which collapse occurs shortly after labour. All the cases were suffering so severely as to require treatment in bed. They exhibited the symptoms which arise in ordinary cases of failure or lost compensation. These included general weakness, anorexia, dyspnoea, palpitation, and oedema. Later symptoms showed dilatation of the heart, rapid irregular pulse, oedema of the lungs, cough, haemoptysis, cyanosis, albuminuria, and in many cases acetonuria and anaemia. The immediate mortality of 82 cases treated was 30 per cent., without taking into consideration the number of cases that succumbed after discharge from the hospital in the first few months succeeding the puerperium. Serious loss of compensation can occur during the latter months of pregnancy, and yet the woman may be put into serviceable condition and go on normally with pregnancy; the author reports 15 such cases which were discharged in good health undelivered. His report includes 75 cases treated in hospital. The prognosis improves the further along in pregnancy the woman is at the time of the first breakdown in the circulatory balance. In 9 cases the first loss of compensation occurred during the ninth or tenth month with but 1 death. In 9 others the breakdown occurred before the sixth month, and of these 7 died, and only 2 recovered. In women giving a history of broken compensation in previous pregnancies or before the

present one, the mortality is increased to 60 or 70 per cent. The age or the para of the woman appears to affect the outlook but little, except that labour in primiparae, being more prolonged, the strain on the heart is greater. It is wise to advise against future conception, though not always justifiable to induce abortion in a later conception unless symptoms arise. When the circulation fails and dilatation begins, the variety of lesion seems to make little difference. The heart with double mitral lesion is the more prone to fail, and also the more able to recover: the simple aortic lesions are the most infrequent, with the best recuperative power. Combined mitral and aortic disease is the most serious of all when compensation fails. The mortality for the child is dependent upon its prematurity and the frequent necessity for artificial delivery. The metabolism of the child is not affected by the uncompensated maternal heart. It is rare that a patient with compensated cardiac defect dies in labour, therefore a clear record of perfect compensation is a valuable asset in any *ante-partum* case with heart disease. Prophylaxis is of importance, and includes the treatment of endocarditis during the stage of compensation. Pregnant women with chronic valvular disease must lead a quiet, regular life, avoiding physical exertion and emotional excitement. Fresh air, ventilation, prohibition of alcohol, a digestible, nutritious diet, and scrupulous attention to the skin and bowels—in fact, the ordinary hygiene of pregnancy is to be well enforced. Resistant exercises and Naheim baths are of great value when as yet there is no loss of compensation. In 75 of the cases under consideration compensation became broken in 72 before admission to hospital: 69 of them recovered under treatment from the first lapse. Rest in bed is more important than drugs. It is more difficult to prevent a second loss of balance than it is the first one. After the patient is up no exertion except short slow walks should be allowed. A tri-weekly examination of the urine should be made, and upon the slightest return of albumen, or oedema or dyspnoea, the patient should return to bed. The medical treatment includes bleeding from the arm, when there is cyanosis and acute dilatation, and the use of the ordinary drugs, digitalis, strophanthus, and caffeine. Calomel and the salines give relief, while morphine and codeine combat dyspnoea and restlessness. Where there is suppression of urine the introduction of physiological salt solution into the rectum is of great service. Nitroglycerine, oxygen, and dry-cupping are also available. Labour should only be induced if the compensation is not promptly restored with rest and therapeutic measures; or, if compensation once lost has been regained, when it may be done at the thirty-sixth week to secure easier labour; or if the compensation fails markedly before the sixth month; or in desperate or moribund cases in the interest of the child. Anaesthesia is generally necessary for induction, and it is wise to use large quantities of oxygen with the smallest possible amount of chloroform. During the second stage of labour a hypodermic injection of strychnine and digitalis may be given, while the management of the third stage must depend greatly upon the patient's condition. If there is dilatation of the right heart with a weak irregular pulse, *post-partum* haemorrhage is rather to be encouraged. But if there is no dilatation, but pallor and a small weak pulse, it is best to put on a tight binder with a folded compress in the epigastrium to maintain the intra-abdominal pressure and avoid the tendency to engorgement of the large abdominal veins. If the patient is anaemic, as so many are if there is any kidney trouble, it is best to prevent all bleeding if possible. After delivery the patient should be closely watched and given oxygen freely and emergency stimulation as required. She is liable to collapse at any time in the first twenty-four or forty-eight hours. Chronic valvular disease is in itself not a serious condition in the child-bearing woman, but timely prophylaxis is all-important. When loss of compensation once occurs the danger is increased a hundred-fold. If the balance can be preserved during pregnancy labour need not be feared, but given one or more severe disturbances of the balance and the prognosis becomes very grave.

GYNAECOLOGY.

268. Gonorrhoeal Conditions in Women.

ANDREW J. LOVE (*Med. Record*, April 17th, 1909) says that gonorrhoea in women is the chief cause of sterility. It is also a frequent cause of sterility in males, and absence of child-bearing is more often due to the inability of the male than of the female to produce a fecundated ovum. It is responsible for most cases of salpingitis and specific endo-

metritis. In most cases that come early to the doctor the woman may be cured by confinement to bed, cleanliness, open bowels, and swabbing the parts with a mild antiseptic fluid. But most cases are neglected until the infection has gone up into the uterus. The peritoneal tissues have become infiltrated, abscess formation has begun, the tubes have had their ciliated epithelium destroyed, and sacculation or abscess has closed the lumen. The ovaries have become cystonata, with prolapse and fixation. When the disease has gone no higher than the cervix, pregnancy lights up the infection, which passes on to tubes and ovaries. Latent gonorrhoea may infect another person who has connexion. Eighty per cent. of men between the ages of 18 and 28 have had gonorrhoea. In some persons one attack gives partial immunity to another attack. Prostitutes will be thus protected, while they will communicate the disease. Their disease is generally in the latent form. A fruitful source of sterility is vulvovaginitis in little girls, which is gonorrhoeal, and causes them to develop into cases of infantile uterus, with imperforate tubes and ovaries that do not mature normal ova. It may be communicated by sleeping with the mother who is infected.

THERAPEUTICS.

269. Biliary Extract in Exophthalmic Goitre.

REVILLET (*Lyon Méd.*, November 15th, 1908) having had good results from the use of an extract of bile in the treatment of the tachycardia of pulmonary tuberculosis, has employed it recently in 2 cases of Basedow's disease. The daily injection of 2 c.cm. of biliary extract in the first case slowed the heart from 200 to 120 beats per minute in twenty-eight days. For the next two months the injections were given daily for fifteen days with intervals of five days. At the end of this time the pulse-rate was 95 to 100, the appetite and strength had improved, there had been an increase in body weight, the goitre had diminished in size, and the tremor, which was distressing before treatment, had disappeared. In the second case ten injections diminished the pulse-rate from 140 to 110. After a month's treatment the pulse-rate was 96, the goitre was diminished in size, and the exophthalmos was much relieved. When the treatment had been suspended for a fortnight, however, the pulse-rate began to rise again. Although Revillet admits that he is not justified in generalizing from such a small experience, he thinks his results encouraging enough to induce others to make a trial of the treatment.

270. Treatment of Ophthalmia Neonatorum with Protargol.

MOTAIN (*Bull. de l'Acad. de Méd.*, May 4th, 1909), discussing the treatment of ophthalmia neonatorum, pays tribute to the service rendered by nitrate of silver, which has been so long used; he, however, considers it dangerous when ulceration of the cornea is present. He considers that great credit is due to Darier for his researches in the organic compounds of silver—namely, argyrol, collargol, and protargol, the latter of which he considers by far the most valuable. The method he adopts is as follows: The lids are washed frequently with a lukewarm solution of weak permanganate of potash 25 cg. to 1,000. If the secretion causes the lids to adhere they should be smeared with iodoform ointment. Every six hours he uses 2 drops of a 20 per cent. solution of protargol, no matter whether a corneal ulcer be present or not; this never does the cornea any damage. In severe cases with abundant secretion, and especially if the cornea is affected, he uses the protargol drops every three hours, and he considers that accidental injury of the cornea is far less liable to occur than if the lids be painted. If this treatment is regularly carried out the secretion is diminished from the first day, and in three, or at most four, days there is but little discharge. The protargol is used at half its strength for several days after the case is apparently cured. Should recurrence take place, which he has never seen if the treatment is fully carried out, he reverts to that first recommended. If a corneal ulcer is present it quickly heals. Atropine is also recommended in order to avoid the occurrence of posterior synechiae. He claims for this treatment that it is simple, without danger, and it gives the best results. He describes ten typical cases.

271. Multiple Subcutaneous Electrolysis.

KROMAYER states that the ordinary method of destroying hairs by electrolysis has the disadvantage of producing a scar which remains visible. In order to limit this

unsightly appearance it is usual to interrupt the process before the hair is completely destroyed, and in this way so-called "recurrences" are frequently seen (*Deut. med. Woch.*, December 24th, 1908). Even when the superficial layer of the hair bulb is destroyed the hair may grow again. He therefore considers that it would be better if the whole process could be carried out subcutaneously, so that it would not be necessary to interrupt the action until the hair was completely and finally destroyed. For this purpose he has constructed electrolytic subcutaneous needles, which are coated up to within from 2 to 10 mm. of the point with varnish. This coating is so thin that it does not hinder the introduction of the needle. Usually electrolytic epilation is performed with one needle at a time, but he sees no reason why several may not be employed simultaneously. He therefore has his needles connected with 15 cm. of the thinnest copper wire, which can be brought in contact with the copper wire of the other needles. Having formed a bundle of such needles, he seizes each one in rotation by artery forceps and inserts it into the hair follicle. When all the needles required are in place the wires are connected with the battery and the current turned on. In applying a number of needles simultaneously it is necessary to adjust the current according to the number of needles acting. It has been found that a current of 5 milliamperes destroys a hair completely in one minute. The complete destruction of the hair can be ascertained by pulling lightly on the hair shaft. The hair will be found to be held tight. On pulling somewhat more strongly, the hair comes away and is found to end sharply, as if cut off. No trace of the hair bulb may be found, as this should have been destroyed by the electric current. Before the process is complete a hardening around the needle is felt, and soon a definite nodule is seen. If this nodule begins to be transparent, it is time to remove the needle, as there is danger of the cutis becoming involved in the necrosis and of the skin "burning through." If five needles are applied at one time the current will be divided into fifths, and it will therefore be necessary to allow a 25 milliamperes-minute current to act. It is wise to apply the strongest current well tolerated, and the author usually begins with 1 milliamperes, and increases this up to 5, 10, 20, and 40. The highest he has used was 50 milliamperes. It must be remembered that the stronger the current the shorter will be the time during which it is necessary to apply the current to destroy the hair bulb. There is no theoretical reason why as many as 100 needles should not be used, but as a rule the current becomes divided irregularly, and uncomfortably strong currents run through some needles, while too little passes through others. At times he finds it wiser to use only a few needles, for example five, and to apply them continuously. After one has done its work on one hair bulb it is withdrawn, and is inserted into another follicle, and so on. In this way there are always five needles acting. In this case it is impossible to calculate the current by milliamperes-minutes, but the process must be determined by the test mentioned above. Care must be taken that at least 2 mm. of varnish-covered needle penetrates the skin, so that 4 mm. of needle (including 2 mm. of bare steel and 2 mm. of varnished steel) lies in the skin. Since there is some danger of producing extensive necrosis of the cutis, it becomes impossible to destroy all the hairs in one area in one sitting. After a few have been destroyed, it is necessary to wait for a while until the inflammatory reaction has disappeared. This may take from a few days to one or two weeks. The method does not produce any scar formation if properly carried out, is easy to carry out, and saves a great deal of time as compared with the usual method of electrolysis.

272. The Incompatibility of Iodide with Pagenstecher's Ointment and Calomel.

It is well known, but constantly forgotten, that if yellow oxide of mercury ointment or calomel be placed in the eye of a patient who is taking iodine in any form, violent irritation is produced, and the morbid process instead of being arrested is accentuated. It is very easy when treating a "strumous" child suffering from phlyctenulae with yellow oxide ointment locally, and with cod-liver oil and syrup of iodide of iron internally, instead of using syrup of phosphate of iron. Next day the child returns with all the symptoms aggravated. Yvert (*Rec. d'Ophtal.*, August, 1908) in a lecture at Dijon treated of this subject. He told his hearers that the iodide acted upon the mercury compound, and produced a mercurous iodide which in the presence of an excess of iodine rapidly decomposed into free mercury and the extremely caustic mercuric iodide. The same unpleasant experiences occurred when oxy-cyanide of mercury was used locally to wash out the bladder of a patient taking

iodide. Hollander (Berlin Society of Medicine, May 16th, 1906) pointed out that this double decomposition with the formation of nascent mercuric iodide could be utilized therapeutically in cases of tubercle of mucous membranes, buccal, laryngeal, and cystic. He found that, especially in tubercle of the bladder, excellent results were obtained. The patient is given a teaspoonful of a 5 per cent. solution of iodide of potassium a quarter of an hour before the local treatment, which consists of the insufflation of calomel or its injection in oily emulsion. Yvert concluded by warning his hearers never to put calomel or yellow ointment into an eye until they had ascertained that the patient had not taken iodine, either from a medical man's prescription or in one of the patent medicines which often contain it.

PATHOLOGY.

273.

Brieger's Cachexia Reaction.

In publishing their third communication on the reaction of the serum of carcinomatous and other patients in inhibiting tryptic digestion, L. Brieger and J. Trebing (*Berl. klin. Woch.*, December 21st, 1908) use the term "cachexia reaction." They record the effect of pancreatin on the serum of carcinomatous persons both when operative treatment has been carried out and when this has been found impossible. They found that in 5 cases in which the antitryptic power of the serum was high, the administration of pancreatin was able to depress the titer to the normal limit. The general condition improved during the exhibition of the pancreatin, and in 2 cases the body weight even increased for a time. They explain that the pancreatin had obviously acted beneficially on the cachectic condition without influencing the carcinomatous process in the smallest degree. In 5 further cases the antitryptic titer was 1.10, and after the exhibition of 20 grams of pancreatin, this rose to 1.15 or more. They say, "it appears by this that the antitryptic reaction may be regarded as the quantitative indicator (Gradmesser; literally the measurer of the degree) of cachexia, in that cachexias whose titer can be influenced by pancreatin may perhaps be regarded as possessing a more favourable prognosis than others whose high antitryptic titer is maintained in spite of the pancreatin treatment; in the first-named category, it is possible that the carcinomatous process is progressing slowly." They further give the results of their continued observations on the serum of cancer patients, which show that in cases of carcinoma with histological confirmation of the diagnosis the reaction was marked; in suspicious cases with clinical diagnosis alone the reaction was just positive, and in three sarcoma cases it was also just positive. Diagnosis cannot be made on the reaction alone, but they find that the cachexia reaction with observations on the influence of pancreatin, when compared with the clinical symptoms, may be useful. It was found in a case which was examined before and after operation that a high titer before the operation fell to normal after the lapse of several months. The patient was doing well and was putting on weight. In non-carcinomatous tumours the serum yielded low values. Lastly, they record the titers of the serum of cachectic patients suffering from other diseases than carcinoma. These include diabetes and phthisis. The antitryptic titer was higher than normal.

274.

Incubation Period of Syphilis.

LEVADITI and YAMANOUCHI (*Ann. de l'Inst. Pasteur*, October, 1908) have endeavoured to find some explanation for the length of the incubation period in syphilis by the study of lesions produced experimentally. They have selected as material for observation the keratitis induced by inoculating the virus into the anterior chamber of the eye of the rabbit, and the lesions produced in anthropoids and monkeys by inoculations over the eyebrow. They find that the incubation period is not due to the existence of any cycle of evolution necessary for the *Treponema pallidum*, but corresponds to the slowly progressive development of the histological lesions which are set up by the multiplication of the specific organism. This multiplication takes place at the commencement only to a small degree, owing to the difficulty which the parasites find in assimilating the new nutritive medium and in accustoming themselves to the change of environment. The active multiplication of the parasite and the concomitant termination of the incubation period is due to the completion of those changes in the vessels and newly formed cellular elements which assure for the *Treponema* a plentiful supply of nutritive material.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

275. Paralysis of Left Recurrent Laryngeal Nerve in Mitral Affections.

OSLER (*Arch. des Maladies du Cœur des Vaisseaux et du Sang*, February, 1909) points out that there are two kinds of conditions in which valvular affections of the heart may give rise to the impression that there exists an aneurysm of the aorta. First, in aortic insufficiency the throbbing of the arch may lead one to suspect aneurysm, particularly in young subjects, where the systolic pulsation of the aorta may be very marked; secondly, in mitral lesions, when great dilatation of the left auricle exists, and when this dilated chamber compresses the left recurrent laryngeal nerve. In most of these cases reported in which with mitral disease there has been left recurrent laryngeal paralysis, it has been shown that the nerve has been compressed between the aorta and the dilated auricle; in some the enlarged pulmonary veins compressed the nerve, and in a case of Fischauer's the left branch of the pulmonary artery compressed the nerve. In some cases both recurrent nerves have been paralysed, and such cases have been explained by assuming that the weight of the dilated and engorged heart has drawn down the arch of the aorta and its large branches so as to irritate and cause atrophy of the recurrent nerve loops. The author quotes three cases which have come under his direct observation. The first patient, a woman of 45, had suffered from heart disease for some years. She was fat, the hands were somewhat cyanotic, and there was marked dyspnoea on exertion. The apex beat could not be felt; a faint thrill was detected, and the area of cardiac dullness appeared to be increased; there was no pulsation to be seen or felt to the left of the sternum, nor was there any tracheal tugging. An apical presystolic murmur was heard, also a systolic murmur conducted to mid-axilla. The voice was doubled-toned, and the left vocal cord was paralysed. Death took place about fifteen months later, and at the *post-mortem* examination the mitral orifice was found stenosed and the left auricle greatly dilated; there was no aneurysm. The second case was a woman, aged 27, who gave a history of scarlet fever and whooping-cough in childhood, and a mild attack of diphtheria some months previously, since when she had been ailing. When seen by the author the typical signs of mitral stenosis were present, and for a year her voice had been altered in character; this was found to be due to paralysis of the left recurrent laryngeal nerve: the apex beat was in its normal position; there was a well-marked presystolic thrill, and cardiac dullness commenced at the third rib. A loud presystolic murmur was heard, followed by a ringing first sound. A short, loud systolic murmur was also present, and the pulmonary second sound was accentuated. About one year later recurrent paralysis still existed, and death occurred about six months afterwards. The third case was a man, aged 48, in whom an aneurysm was suspected. There was oedema of the legs and of the bases of the lungs, dyspnoea, and signs of grave asystole when seen by the author. Cardiac pulsation was seen in the third, fourth, fifth, and sixth left interspaces, and also in the second left interspace. On auscultation the double murmurs of aortic and mitral disease were found; the voice was binaural, and the left recurrent nerve paralysed. Improvement in the patient's general condition occurred; x-ray examination showed a very much enlarged left auricle and absence of aortic aneurysm. At the *post-mortem* examination, on opening the pericardium, the appendix of the right auricle was found to reach to the left sternal margin, and the rest of the anterior surface of the heart was formed by the right ventricle; the aortic valves were incompetent; the mitral orifice admitted two fingers, the tricuspid three. All the cavities of the heart were dilated, and the heart generally much hypertrophied. The left auricle was enormous, the aortic valves were sclerotic, the mitral flaps thickened, also the chordae tendineae, and the mitral orifice somewhat narrowed. The left recurrent nerve appeared sclerotic and of an opaque white appearance in that part which was compressed between the left auricle and the aorta.

276. Thrombosis of the Portal Vein.

HECHT (*Wien. klin. Woch.*, 1908, p. 944) reports the fatal illness of a girl aged 15 years, who had a fall downstairs when 6 years of age. Directly after this accident she

vomited dark-red fluid, and attacks of vomiting continued until she was 10. Then they ceased for several years, appearing again when the patient had reached the age of 14. She became emaciated, and when admitted into hospital Hecht noted that the abdomen was distinctly prominent in the region of the epigastrium, the stomach was distended with gas, the liver seemed beneath its normal size, whilst the spleen was enlarged, firm, but not tender. On the day of admission there was free vomiting of dark-brown blood. The temperature was above normal, and the urine, at first free from abnormal constituents, contained nucleo-albumen later on. Blood was frequently found in the motions. On the eighth day oedema of the left foot was observed; ascites followed, the oedema extended to the thighs and vulva, the spleen enlarged rapidly, and the liver also increased in size. The patient died after several attacks of haematemesis. There was thrombosis of the splenic vein. The portal vein was also thrombosed, as had been diagnosed before death; the process had begun in a small varicose pouch, which held a soft clot. On dissection, it was found that the portal vein ran an abnormal course; inferiorly it lay external to the common duct, then it twisted round so as to lie behind that duct, and curled once more forwards, crossing the cystic duct, and entered the liver between the cystic and the hepatic ducts. The cystic duct pressed on the portal vein, and was seen to be the cause of the thrombosis. Hecht, in conclusion, declared that in this case the vein might easily have been mistaken for the common duct had an operation been performed.

277. The Opsonic Index in Lobar Pneumonia.

F. DE MARCHIS (*Lo Sperimentale*, Florence, 1908, lxii, p. 681) has investigated the opsonic index in 17 patients with lobar pneumonia, daily in 10 of them. Of these 10, 4 died, 5 recovered, and 1 recovered after a metapneumonic empyema had been operated on. In all he found that the opsonic index fell during the first few days, rose again before the crisis, and reached the normal again a day or two after the crisis; the administration of quinine made no difference in the index. No rise took place in the cases that did badly, though recovery might occur after the index had fallen to 0.35. In the case developing an empyema after the pneumonia, the index none the less rose to about the normal after the crisis. De Marchis thinks that some care must be exercised in drawing prognostic criteria from the behaviour of the opsonic index in lobar pneumonia; no direct connexion between the index and the degree of leucocytosis attained seemed to exist, and the variations in the index were the same for Fränkel's diplococcus and for *Staphylococcus pyogenes aureus*—hence the opsonin is not specific. He found that many of the leucocytes of the pneumonia patients were incapable of ingesting either the diplococcus or *Staphylococcus pyogenes aureus* in the earlier stages of the disease; and that a spontaneous phagocytosis of these microbes would take place if they were exposed to the leucocytes for some hours in the incubator.

SURGERY.

278. Appendix Abscess in a Young Child.

CHURCHMAN (*Johns Hopkins Hosp. Bull.*, February, 1909) records a case of appendicitis in a child, aged 27 months, with an analysis of 8 other cases under 5 years of age which occurred in the Johns Hopkins Hospital. Originally brought to the hospital with painful micturition of twelve months' duration, becoming worse five days previously, a diagnosis of vesical calculus was made. Examination of the abdomen was negative, and although x-ray suggested a calculus, none was found after careful search under ether, and the symptoms disappeared. A week later, fever, abdominal distension, pain and tenderness, especially on the right side, developed, typical of acute perforative appendicitis with abscess, and an appendectomy and drainage was performed. Except for an early post-operative reaction (rapid pulse and temperature, with negative abdominal condition), possibly due to iodoform poisoning, convalescence was uneventful and recovery complete. The substitution of plain gauze drains for iodoform gauze remedied the above condition, and points

to the wisdom of using plain gauze in young children. Short notes of the other 8 cases are given, while of the whole 9, 6 were boys. Five of the cases gave no history of previous attacks, and the disease was of a severe type when first recognized, perforation having occurred in all. In 4 only did the diagnosis present difficulties, tuberculous arthritis, general peritonitis, cerebro-spinal meningitis, and vesical calculus being the differential diagnosis respectively. Not only were the urinary the only symptoms in the case recorded, but the diagnosis of calculus was supported by x rays, and abdominal examination was negative and the temperature normal. The probable pathology was acute appendicitis characterized by pelvic peritonitis, causing bladder symptoms, which, after subsiding for a time, recurred with rupture and abscess formation extrapelvic. The possibility of appendicitis must be borne in mind in the differential diagnosis in children presenting urinary symptoms or signs of possible hip disease. Palpable resistance on the right side per rectum is a frequent sign, and points to the importance of rectal examination in any doubtful case. As regards prognosis, there is less reason for operative delay in these cases than in adults, as the outlook is good in all such cases unless general peritonitis has occurred, when it becomes almost hopeless.

219. Sunshine and the Eye.

E. O. SISSON discusses (*Ophthalmology*, January, 1909) the effect of intense sunlight upon the eye of the blonde type, in a paper which is preliminary to a research he is undertaking. He reviews the arrangements which Nature has made in a large number of animals to protect the nervous elements of the eye from the deleterious action of the violet and ultra-violet rays. He arrives at the following conclusions: (1) Normal eyes contain pigment which absorbs all rays which are unnecessary for vision. (2) The macula where accurate vision is centred is the best protected by pigment deposits. (3) One of the functions of the visual purple may be to protect the delicate nerve tissue of the retina from light. (4) Pigment does not exclude dangerous actinic rays, such as those from the tuiol mercury vapour lamp. (5) That these actinic rays are destructive to living protoplasm. (6) The anatomy and function of any organ at a higher type can be better understood by a study of the same organ in a lower. (7) The amount of pigment in the eyes of animals and birds and the presence of other structures to protect their eyes from excessive light varies with their habits and the region they live in. (8) We have ample proof that light injures eyes. (9) Glasses protect the eyes because glass absorbs the ultra-violet rays. (10) The facts adduced show the necessity for pigment in the eyes; the density of the pigment must be in proportion to the degree of light to which the man has to be exposed.

220. Anterior Dislocation of Shoulder.

THOMAS (*Am. Journ. of Med. Sciences*, February and March, 1909) discusses at length the etiology, pathology, and treatment of habitual or recurrent anterior dislocation of the shoulder. Seeing that the lesion is due to a traumatic cicatricial, anterior hernial pouch of the capsule, the object of any operation for its relief must be to obliterate the hernial protrusion, and at the same time any free or attached joint body that may be present can be removed. The essential cause of such recurrences is a relaxation due to the addition to the original capsule of the new cicatricial portion which bridges over the gap between the margins of the tear produced by the first dislocation. In 34 cases collected from the literature the operation of capsulorrhaphy, or shortening the capsule, was followed by success in 33 of the cases, and in the one apparent failure recurrence took place a month later only after a degree of violence sufficient to have produced dislocation in a normal shoulder. In all of these the incision employed either divided the deltoid or separated it from the pectoralis major, but the axillary incision was followed in the author's case as being the better route, since division of the deltoid is avoided and the site of the original capsular tear is better exposed, while a smaller incision is required and, if drainage is needed, it is dependent. The only muscle divided was the subscapularis, and the anterior circumflex vessels were divided between two ligatures in order to allow of retraction inwards of the large vessels. This route exposes exactly the part of the capsule torn, which in the case recorded presented a protrusion. While good results have followed merely reefing the capsule without opening it, exploration of the joint is advisable in order to remove any movable joint body that may be present. The opening in the capsule is closed by sutures, either by overlapping the edges or after excision

of a piece of the capsule. Prior to operation the patient had had nine dislocations, and these even recurred while he was wearing a leather shoulder brace which had for its main object the limiting of abduction. A fortnight after the operation all bandages were removed and a leather brace substituted for a week, and in the fourth week he was allowed to use his arm freely without strain. In the sixth week forcible movements were tried, and he was able to hold the arm in the vertical position in abduction with the arm alongside the head, and nine months after the operation he had full use of the arm and shoulder, swimming, boxing, and swinging a sledge hammer.

231. Scoliosis and Infantile Paralysis.

M. FIRMIN CARLES (*Rev. d'Orthopédie*, January, 1909) reviews several cases of spinal curvature in infantile paralysis, together with the current French theories concerning the causes of scoliosis in association with this disease. The article is illustrated with photographs of several of the patients, and the study of the distribution of paralysis by the electrical methods is very complete. The author concludes that all these cases cannot be attributed to the variation in the length of the legs which follows a unilateral paralysis, but that they are primarily paralytic and due to unilateral, partial, or complete paralysis of spinal muscles. The scoliosis that is a result of inequality of the limbs is long in making its appearance, is compensatory in character, and easily cured by levelling the pelvis; whereas, on the contrary, the scoliosis that is primarily paralytic makes its appearance early after the incidence of the acute poliomyelitis. The views of Messner and Kirmisson—namely, that the convexity of the curve is in general directed towards the sound side, and only occasionally towards the side of the paralysis, and that the cause of this is contraction of the unaffected muscles—are not acceptable to the author. His opinion is that the scoliosis is due to unilateral, partial, or complete paralysis of spinal muscles, and that the convexity of the curve, according to the case, is directed towards the sound side or the paralysed side, and is determined by three factors: (1) The extent of the paralysis, whether total, unilateral, or limited to a definite region of spinal muscles and unilateral in that region; (2) the degree of rapidity of onset and intensity of lesion on one or other side (atrophy of affected muscles and unilateral atrophy of the bodies of the corresponding vertebrae); (3) the contraction of the spinal muscles of the sound side which are the antagonists of the paralysed group on the opposite side, and symmetrical with them.

OBSTETRICS.

232. Management of Occipito-posterior and Transverse Positions of the Fetal Head.

KNAPP (*Bull. Lying-in Hosp. City New York*, September, 1908) writes that one of the commonest causes of prolonged labour is the lack of rotation of the fetal head either before or after entering the superior strait. Though the pelvis may be large, and the other conditions normal, the mother may exhaust herself, attempting to push out a head which does not advance owing to its abnormal position. From a half to two-thirds of all occipito-posterior cases rotate spontaneously, and interference is unnecessary unless the mother or child shows signs of exhaustion. It is not always possible to tell whether a case is going to rotate or not, but by watching it for a certain period we can tell whether there is any change in its position. Other conditions being normal, if there is no change for two hours after the beginning of the second stage, it is hardly probable that there will be any, and it is best to interfere. In these cases special attention should be paid to the condition of the mother and child, and interference is desirable rather early than late. Frequently a woman will not get a fully-dilated cervix by her own efforts, especially in occipito-posterior cases, when she may even die from exhaustion before the cervix is dilated. If the head is small in relation to the pelvis, one may wait longer for rotation than when the head is large. An absolute diagnosis is necessary for a successful cephalic application. This is not always easy to make. Even when familiar with the sutures and fontanelles, the bulging of the occasionally unruptured membranes and the caput hamper the examiner. If the head is well down in the pelvis, two fingers will as a rule suffice, though it is necessary to be perfectly familiar with the sutures and fontanelles. The anterior or large fontanelle has four sutures running from it, while the posterior has three. When one

is sure that he feels the posterior fontanelle, it is necessary to distinguish the sagittal suture; as a rule its edges may be worked upon themselves by the fingers, while the lambdoid suture is generally overlapped. The diagnosis is only complete when the size of the head and the size and shape of the pelvis are made out. If the examination cannot be completed with two fingers, the patient should be placed under chloroform, and the whole hand used. If the head be floating above the brim, and by our examination we decide that it can come through, the first step is to rotate it with the hand. The external hand can assist by attempting to rotate the body through the abdominal wall. The tendency of these heads is to again assume the occipito-posterior or at least the transverse position after the hand has been withdrawn; if this occurs, the use of forceps is indicated, or a version must be performed. Where the pelvis is irregular or the fetal head soft, a version is preferable; where the head and pelvis are normal, the writer usually tries forceps, but if a satisfactory application is not quickly made, he resorts at once to version. If after rotation the head remains anterior, the position is occipito-posterior, and delivery takes place accordingly. In some cases the head becomes lodged in mid-pelvis; the best procedure is to rotate with the hand and apply the forceps, or it may be possible to bring the head to a transverse position by the hand when complete rotation is impossible, and to make a cephalic application from the transverse position. Rotation by means of the forceps is liable to injure the head and the maternal soft parts. In rotating by the hand or the forceps, slight upward pressure should be made. In a large number of cases where the head has spontaneously reached the perineum in an occipito-posterior position, it may be rotated to an anterior position by either the manual or the instrumental method.

283. Pregnancy and Phtisis.

NEITNER (*Zentralbl. f. Gynäk.*, No. 8, 1909) has collected, in a Strassburg thesis, 27 severe and 34 milder cases of tuberculous pulmonary phtisis detected in a series of 5,720 pregnant women. In 41, or 67 per cent., of the cases the lung symptoms grew worse during pregnancy. In every case where the larynx was involved the patient's condition became aggravated in the puerperium. In 18 cases pregnancy was interrupted by an obstetric operation; in 3 by Caesarean section, for pelvic contraction in 2, and for cancer of the cervix in the third; in 3 by induced abortion, and in 7 by induction of premature labour. In 16 abortion or premature labour occurred simultaneously. In Neitner's series induction of abortion gave the best results, but this obstetric operation was mostly practised on patients where the lung disease was not advanced. The stage of phtisis in any particular case is of great importance in regard to artificial interruption of the pregnancy.

GYNAECOLOGY.

294. Primary Cancer of Female Urethra.

MAISS (*Zentralbl. f. Gynäk.*, No. 3, 1909) recently read before the Breslau Gynaecological Society a report of a case of this rare condition—the twentieth authentic instance of primary urethral cancer recorded in medical literature. He observed that Karati had published a monograph on cancer of the female urethra, including 57 cases, amongst which 19 were without doubt primary, 4 more were of doubtful origin, and 34 were classed as vulvo-urethral cancer. Maiss's patient was 46 years of age; she had given birth to four children spontaneously, the last labour occurring fifteen years before she came under the reporter's care. The catamenia were normal. She consulted Maiss for dysuria of less than two months' duration, ending in retention, so that for several days no urine could be passed without the catheter. A tumour of the size of a walnut pushed out almost the entire anterior wall of the urethra; it was of firm consistence and was found to proceed from the posterior wall. The urethral canal was so narrow and the obstructing tumour so tough that it was a slender catheter could not be passed without some force. There was no disease of the internal organs and no evidence of glandular infection. The tumour was excised. Three weeks later, as there was incontinence of urine, an artificial urethra was made, but the results were at first unsatisfactory. The patient was discharged from hospital with a urinal, but returned for inspection six weeks later in good health and able to hold her urine.

THERAPEUTICS.

295. The Limitation of Common Salt in Diet as a Therapeutic Agent.

THE employment of an exclusively milk diet in the treatment of disease was first scientifically suggested by Karell in 1866, but was not largely employed by the medical profession. Jacobs referred to this method of treating disturbances of circulation and adiposity last year, and appears to have attracted more notice than Karell did. Mendel (*Munch. med. Woch.*, March 2nd and 9th, 1909) finds that the undoubted benefit which follows the employment of a strict milk diet has been explained in various ways. Some observers have inclined to the view that milk improves the condition of the cardiac muscle, and reduces waste energy of the heart. Others have ascribed the benefit to the peculiarly happy mixture of albumen, fat, and carbohydrate, and consider that the little stimulating effect of milk is responsible for its diuretic action. Romberg and his followers, however, regard these grounds as secondary, and believe that milk acts in virtue of its poverty in sodium chloride. Mendel argues that if Karell's method is really dependent on a limitation of sodium chloride, the same beneficial results would be obtainable when any other diet containing very little common salt is given. He cites a case in support of this contention. The patient was suffering from myocarditis. The quantity of urine increased rapidly, and the anasarca and ascites disappeared in response to a course of Karell's treatment. Six weeks later the symptoms recurred, and as the patient objected strongly to the milk diet, he was given a diet consisting of coffee with milk, meat, bread, butter, potatoes, and fruit, without any additional salt. The symptoms disappeared in response to this diet as rapidly as they had done under the milk diet. A second case is mentioned in support of the same idea. Here it was shown that an excessive intake of sodium chloride was chiefly responsible for symptoms of dropsy, etc., while the same disappeared as soon as milk diet was ordered. Milk contains but 1.6 gram of sodium chloride per litre. Mendel claims that it is this small salt content of milk which produces the marked change. In cases of adiposity, without oedema and without any disturbance of the circulatory system, the employment of a diet containing a limited quantity of salt produces increased diuresis and loss of weight. Common salt used to be regarded as an indifferent substance. Javal and Widal first showed that a retention of 1 gram of sodium chloride was capable of producing oedema. It has been shown that if the quantity is reduced to a minimum the osmotic pressure of the fluids in the vessels and tissues increases, and more water is attracted in order to reduce this increased osmosis. It is difficult to determine how far the increased absorption of water, following on an increased intake of sodium chloride, is physiological, and how far it may be considered to be pathological. Mendel speaks of a hydraemic plethora, as distinguished from a true plethora, by which he means the increase beyond normal limits of water in the organism. The experiments of Cohnheim and Lichtheim lend support to his theory. They found that no apparent changes take place when physiological saline fluid in large quantities is injected into the vessels of animals. The rate of circulation, however, is found to be increased until the organism has reduced the quantity of fluid to normal limits again. If the animal is killed before this takes place, the organs of the abdomen are found to be oedematous, while those of the thorax are natural. Further, when the femoral vein is tied no oedema is seen, but if saline fluid be injected in large quantities after the ligature, the limb swells considerably. Clinical as well as experimental evidence is available, which tends to show that hydraemic plethora in itself does not lead to retention of fluid, but as soon as the circulatory organs are damaged it immediately leads to oedema. Mendel argues that the oedema of acute and chronic nephritis and of heart disease depends on the primary presence of a hydraemic plethora. He applies his arguments to a number of other conditions, including eczema, burning of the surface of the body, thrombosis of veins, etc. He further shows by means of cases that the action of digitalis is at times only evident when employed together with a limited supply of sodium chloride. The marked effect of a milk diet in cardiac oedema is also illustrated by clinical histories. In speaking of a limited supply of salt, he means from 2 to 4 grams in twenty-four hours. This represents from one-eighth to one-quarter of the normal intake. It is, in his opinion, inadvisable to cut off the sodium chloride altogether.

This is conveniently supplied in milk, but other diets yield similar results. Children stand exclusive milk diets well, and the same applies to adults suffering from acute illnesses. Adults who need a prolonged limitation of salt cannot be kept sufficiently long on milk, and therefore need a mixed diet with little salt. He speaks in the highest terms of the effects of limiting the common salt for a number of disturbances of the circulatory organ, etc.

236. Vitralin, a Disinfecting Wall Paint.

XYLANDER has compared the disinfectant qualities of various wall paints, and has paid special attention to a substance called vitralin, which is, according to the manufacturers, Rosenzweig and Baumann, Cassel, a product of linseed oil varnish with other substances, which hasten oxidation (*Arbeit, a. d. kaiserlichem Gesundheitsamte*, vol. xxix, Part 2, 1908). It contains no resins or copal, and no white lead. It is said to resist the influence of vapours, gases, acids, salts, and sea water. It was compared with white lead and zinc colours, calcium paints, and glue containing paint. The various paints were applied to tiles, oak boards, clinkers, and glass plates in three coats and allowed to dry. After the surface was dry, infection with various bacteria was undertaken. When the plates, etc., were exposed to daylight, tubercle bacilli were killed in three days, as against five days by oil paint, ten days by the other forms of paint. *Bacillus typhosus* and *paratyphosus* were killed in six hours, as against eight hours by oil paint (the other paints did not kill at all), while diphtheria bacilli were killed in four hours by vitralin and in five hours by oil paint, while the other paints took ten days. When kept in the dark, more marked differences were seen, as are shown in the following table:

	Vitralin.	Oil Paints.	Other Paints.
Tubercle bacilli ...	Killed in 5 days	Not killed in 30 days	Not killed in 30 days.
Typhoid bacilli ...	Killed in 10 hours	Killed in 12 hours	Not killed in 10 days.
Paratyphoid bacilli ...	Killed in 10 hours	Killed in 12 hours	Not killed in 10 days.
Staphylococci ...	Killed in 13 hours	Killed in 16 hours	... 30 days.
Diphtheria bacilli ...	Killed in 5 hours	Killed in 6 hours	Not killed in 10 days.
Anthrax spores ...	Not killed in 30 days	Not killed in 30 days	Not killed in 30 days.
Streptococci ...	Killed in 10 hours	Killed in 12 hours	Not killed in 10 days.

In further experiments, he found that the bactericidal action of vitralin was still present toward the vegetative forms after three months. In the control experiments oil paints also exercised a bactericidal action after the same time, but this was less marked than that of vitralin, save with diphtheria bacilli. The other paints had no action. He was able to show that the presence of oxygen was necessary for the action of vitralin, and that no disinfection took place when carbonic acid gas or hydrogen was used. The action proved to reach an optimum with a medium degree of moisture. Dry air prevented the action within thirty hours, while saturated air only allowed vitralin to kill after twenty hours. Previous soaking of the painted plates, etc., in strong solutions of the ordinary disinfectants, with subsequent washing off, did not lessen the disinfecting qualities of the paint. Xylander therefore speaks in high terms of this paint.

PATHOLOGY.

287. Exudates and Transudates.

ALONZO (*Rif. Med.*, March 29th, 1909) sums up the results of an experimental examination of some of the characters differentiating exudates from transudates. He finds that as a rule the density varies directly with the percentage of albumen. Exudates usually have a greater percentage of albumen than transudates, at least as far as simple effusions are concerned; but effusions are often of a mixed character, sometimes starting as simple exudates and becoming mixed with transudates, or vice versa, or even beginning *ab initio* as mixed effusions; this mixing may be of a temporary or permanent character; according to the nature of the cause. The percentage of

albumen forms one means of differentiating between the two types. The albumen found in effusions has a double source, namely, from the blood and from the surrounding tissues. A source of fallacy in estimating the percentage of albumen is the ignorance of what proportion the mass removed bears to the mass of liquid left, the degree of concentration, for example, after the first withdrawal of a transudate the albumen may not only not decrease but increase, which may be due to absorption of fluid and increased concentration of what is left, or to increased outpour of albumen from the tissues and blood due to good nutritive condition, or, on the other hand, if these conditions can be excluded, may be due to the onset of an inflammatory state and admixture with exudate. Later and repeated exploratory punctures show a steadily decreasing amount of albumen; *ceteris paribus*, the longer the fluid remains in a cavity the richer it becomes in albumen. Exudates contain more albumen than transudates, owing to the changes in the blood vessels and tissues brought about by the processes of inflammation. The estimation of the percentage of albumen, although subject to fallacies like other methods, still remains the best means of differentiating between the two classes of fluid, and possesses an absolute value in the case of pure effusions.

288. Reactions of Cobra Venom with Antiserum.

CALMETTE and MASSOL (*Ann. de l'Inst. Pasteur*, February, 1909) summarize as follows certain observations which they have made on the interactions of cobra venom with the serum of vaccinated horses: (1) The serum of the horse vaccinated against cobra venom precipitates this venom. (2) This precipitate only appears at the moment when the mixture of serum and venom becomes atoxic, and after about one hour at the temperature of the laboratory. It fails to be produced when the serum is in excess. (3) Hence this precipitating reaction may serve to measure approximately *in vitro* the antitoxic value of an antivenom serum. (4) In a mixture of serum and venom, exactly neutralized, the precipitate and the liquid, separated by centrifugalization, are atoxic. (5) The precipitate appears equally well when solutions of unheated venom are employed, and when the solutions of venom are previously deprived, by heating to 76° to 78° C., followed by filtration, of their albumens coagulable by heat, which are atoxic. (6) The atoxic precipitate of serum and venom in the fresh state is insoluble in physiological salt solution, but soluble in water slightly acidulated with HCl or in presence of an excess of venom. (7) The same precipitate, heated to 72° in an acid medium, recovers almost all its previous toxicity. The venom and the antitoxin therefore become dissociated, and the antitoxin is destroyed. (8) In becoming precipitated under the action of the serum, the venom takes up about thirty to forty times its weight of dry serum extract. (9) The toxic precipitate of serum and venom, when separated by centrifugalization and washed, may be preserved in the dry state. In this form it is insoluble in an excess of venom and in acidulated water, but it may be dissolved and commence to split up on digestion by trypsin or papain. If the product of this digestion be heated at 72° in presence of a very small quantity of HCl, the antitoxin is destroyed, whilst the venom is set at liberty, and recovers all its toxicity and its capacity for being neutralized again by antitoxin.

239. Search for Tubercle Bacilli in the Sputa.

VALERIO (*Rif. Med.*, July 27th, 1908), referring to the well-known difficulty of detecting, quickly and surely, tubercle bacilli in the sputum of early cases of tuberculosis, just when it is most important to know, describes certain experiments he has carried out. His object was to find some culture medium which should favour the growth of tubercle bacilli and retard the growth of associated bacilli. Hesse's medium has been highly recommended as a suitable medium for this purpose, but the author believes that there is no ground for this assertion, and that the apparent advantage of Hesse's medium is really due to some substance contained in the added sputa. He believes that sputum contains some nutritive substance which is favourable to the growth of tubercle bacilli. Moreover, control experiments showed that Hesse's medium did not hinder the development of other bacteria. Hence, the practical conclusion is that the quickest and best method of developing tubercle bacilli cultures is to place the sputum for forty-eight to seventy-two hours in a thermostat at 37° C., in a Petre capsule, on a piece of blotting-paper, and examine every six hours. The common organisms found in sputum do not hinder the development of the tubercle bacilli.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

290. *Streptococci and the Diseases of Childhood.*

J. RITTER (*Berl. Klin. Woch.*, April 5th, 1909), who deals with the significance of streptococci in diseases of childhood and their treatment by serumtherapy, states that local suppuration rarely occurs by means of streptococci alone. In the majority of these cases staphylococci are found primarily, and the streptococci occur as secondary infecting organisms. Garré's experiment of causing an infection by rubbing staphylococci into the unbroken skin never succeeds with streptococci. These organisms produce local infections at times, and at other times general infections. This he believes to be due to the differences in the nutrient media, that is, in the tissues, and not to differences in the cocci. In affections of the tonsils, in rheumatism, and in infective processes of the skin and the mucous membranes, the streptococci which are frequently found are always associated with some other micro-organisms. In enteritis and pertussis at times streptococci are found, but in each case their presence can only be regarded as secondary. The significance of streptococci in diphtheritic infections is next dealt with, and the author expresses the opinion that the signal of danger is to be found in the plentiful presence of these secondary invaders. In scarlatina, too, he regards the occurrence of streptococci as accidental and not as a causal organism. The primary activity of streptococci is limited to erysipelas, some forms of fresh local suppuration and acute infections of wounds. He believes, however, that streptococci are practically always the same, no matter what symptoms they call forth. He does not place any confidence on the agglutination phenomenon as a means of differentiating the kinds of streptococci, and concludes that it is only the soil which causes differences in the virulence. Thus, it makes all the difference whether the cocci have been grown in the human tissues or in animal tissues or on artificial culture media. This is the cause of the difficulty in preparing efficacious immune serums for therapeutic purposes. Four different classes have been introduced. First there is the serum gained by treatment with non-virulent cocci derived from human affections (for example, Menzer, Parel, Moser). Secondly, there is the serum gained by cocci the virulence of which has been increased by passage through animals, but this serum is useless for human streptococcal infections (Marmorek and Aronson's first serum). Thirdly, the serum is gained by means of the original human coccus and also the same coccus, which has been rendered virulent by passage (Aronson's second preparation, Ruppel). Fourthly, there is the serum gained by primary treatment with cocci which are virulent to animals and subsequent treatment with human cocci (Meyer-Ruppel). The first two types are of theoretical, but not of practical, value. The author therefore investigated the effect of Aronson's second preparation, but states that he realizes that Meyer-Ruppel's serum possesses distinct advantages over this one. Although he regarded it as extremely doubtful whether the serum would prove active against a chance strain of streptococci which produced a given infection, he was quite surprised at the good results he obtained in erysipelas. In all he treated 22 children by means of the serum for erysipelas. The dose taken was 20 c.c.m. for each 10 kilograms body weight. In 80 per cent. of these cases the symptoms disappeared within two days after the injection, while the rest were cured within three days. Only in 3 cases did a mild rash appear later. In all his cases he was astonished to find extremely little bad after-effects. In four advanced cases of umbilical infection (primary) of infants, the serum was tried, but all the infants died. He obtained, however, apparently good results in secondary infection of the tonsil with the serum. In 34 cases the process rapidly cleared up. Further, he treated 19 cases of scarlatina with scarlatinal serum. Of these, 10 recovered and 9 died. The recovery, however, corresponded to the rapid fall in temperature and disappearance of symptoms, as is seen in mild cases. Details of these cases are given; 14 cases of septic diphtheria were treated with streptococcal serum as well as with diphtheria antitoxin. Although the number of these cases is small, he considers that the results which he obtained justify a continuation of this form of treatment. He considers that the antistreptococcal serum

should be employed where other means of treatment fail. In any case it should be employed before the infection is so far advanced that no form of therapy is capable of saving the life.

291. *The Heart in Acute Infectious Disease.*

ROBINSON (*Amer. Journ. Med. Sci.*, December, 1908) regards the management of the heart during the early period of convalescence from acute infectious diseases as of paramount importance in treatment, since upon the prevention of cardiac dilatation mainly depends the patient's future vigour and well-being. Without ignoring other organs, it must be borne in mind that the heart stands out primarily and essentially in need of careful watching and treatment in the majority of instances, more especially in typhoid, diphtheria, influenza, pneumonia, and scarlet fever, while in acute articular rheumatism there is the added danger of inflammatory complications. The cardiac muscle and its nervous control are generally organically affected if the infectious disease has been severe or of long duration, more or less cloudy changes and fatty degeneration being produced by the various toxic elements associated with the particular disease. Various pathological lesions may exist affecting the cardiac nerves, muscle, and vessels, and it is probable that, in cases where the infectious disease has been grave or prolonged, a relatively acute myocarditis is set up. As to treatment—for example, in typhoid fever—it is held to be wise not to allow the patient even to sit up in bed for a week or ten days after the temperature has reached the normal, and he should not leave his bed until he has sat up in bed several times without causing any considerable changes in his pulse or cardiac action. Increased pulse-rate, irregularity, or intermittence, especially if associated with a soft systolic mitral murmur, accentuation of the pulmonic second sound, or a notable lack of tone in the first sound, are indications for a further period of rest in the recumbent position. Marked slowness of the heart's action requires, if possible, greater care, owing to the liability to cardiac failure; and mental rest is as important as physical, especially in those whose occupation has been pre-eminently an intellectual one. Of drugs, strophanthus by mouth or hypodermically is recommended during the acute attack, followed later by strychnine, coca, or digitalis, and iron when there is evident anaemia. For convalescents in poor circumstances recovering from such diseases the need for institutions more especially devoted to their treatment is urged.

SURGERY.

292. *Surgical Treatment of Basedow's Disease.*

H. MOSES (*Berl. Klin.*, April, 1909) discusses the value and prognosis of surgical intervention in the treatment of Basedow's disease, and suggests that recourse to the knife is too often neglected or unduly delayed in favour of purely medical methods. The inclusion of this grave and distressing affection in the increasing list of maladies that are now brought under surgical as well as medical care is justified, in the first place, by the fact that of the many different theories of the origin of Basedow's disease, that of Moebius, which assumes a morbid condition of the thyroid body and a morbid change in its secretion, has received the widest acceptance. A remote and primary cause may be found in disease of the sympathetic or some altered condition of the blood, but if, as Moebius holds, the symptoms of Basedow's disease are due to flooding of the organism by a toxic thyroid secretion, removal of the source of this agent is fairly indicated. Operative treatment, Moses holds, is indicated in every case of Basedow's disease, whatever form this may present, when a not unduly prolonged course of medicinal treatment has failed to do any good. Stress is laid upon the necessity of intervening before the development of severe cardiac and pulmonary complications. In operations practised directly on the thyroid body with the object of reducing the amount of secreting tissue, and thus restricting the discharge into the organism of its toxic secretion, it is advisable, the author states, to protect the wound in the neck against infection from the patient's mouth and hair by a small sterilized screen placed just below the

chin. In discussing the choice of the anaesthetic method in such operations on the thyroid, he recommends general narcosis in preference to local anaesthesia, as being more convenient for the surgeon, not more dangerous in this than in any other class of operations, and for the sensitive and restless subjects of Basedow's disease more humane. In the surgical treatment of this disease by direct attack on the gland, hemistruumectomy, or removal of one lobe, has hitherto been the operation of choice. Ligation of the thyroid arteries has not met with much favour. In most instances three arteries have been tied, but some surgeons have secured and divided all four vessels without any serious results. This method is specially indicated in cases of quite recent and not very severe Basedow's disease with a very vascular goitre. Jaboulay's operation of exothyropexy, by which the enlarged gland is exposed and displaced but not removed, might do some temporary good as a palliative measure in cases of asphyxia caused by very large goitre, but only in very exceptional cases would it, in the author's opinion, be indicated in the treatment of Basedow's disease. Resection of the superior cervical ganglion, which has been practised by French surgeons holding that the morbid phenomena of Basedow's disease are due to a primary lesion of the sympathetic system, is not favoured in Germany. This operation, the author asserts, has technical difficulties, and its results have not been encouraging. The mortality of unilateral strumectomy for Basedow's disease, though it has in the course of the last few years been reduced from about 13 to 14 per cent., is still higher than that of the same operation in other forms of goitre, which in Kocher's last series of 600 cases was not more than 3 per cent. In many cases of the form of goitre under discussion the thyroid vessels, especially the veins, are very large and easily lacerable, and the free and continuous bleeding may endanger life, not only directly, but also indirectly by flooding the field of operation and prolonging the work of the surgeon. Partial removal of an exophthalmic goitre has been brought into discredit also by frequent instances of sudden death during or soon after the operation. In most instances of this disastrous complication of strumectomy for Basedow's disease, death, the author points out, is due, not, as was formerly supposed, to the action of the anaesthetic, but to the association with the goitre of a persistent and hypertrophied thymus. The difficulty in diagnosing this condition sometimes prevents the surgeon from rejecting in a case of this kind the idea of an operation; but, as the author points out, it should be borne in mind that to the subject of Basedow's disease who has not undergone any surgical treatment an enlarged thymus is a constant cause of dread and danger. Another unfavourable condition to surgical intervention, which is attributed to delay in associating surgical with medical treatment, is the advanced development of toxic lesions of the heart and lungs. The post-operative occurrence of so-called thyroid fever has, the author asserts, been seldom observed, and may, it is held, be effectually prevented by proper attention to the aseptic technique of the operation. Moses gives a very favourable report of the results of strumectomy observed in the large majority of patients who have recovered from the immediate effects of the operation. There are good grounds, he states, for full satisfaction in regard to the decided benefits following surgical treatment. Marked signs of improvement are rapidly developed during the first week, after which there is a continuous, though slower, advance. In the course of the first three or four days the pulse frequency falls from 150 to 80. The subjective symptoms are relieved very quickly, the patient becoming calmer and less irritable, and the mental tone being much improved. It is acknowledged, however, that instances of ideal cure in which all the symptoms of Basedow's disease disappear are very rare. Exophthalmos is a very resistant symptom, which, though it may be slightly modified after the operation, usually persists when every other symptom of Basedow's disease has disappeared. In the exceptional cases in which surgical treatment has not influenced the objective signs the general condition is usually much improved and the patient feels as if restored to good health and former vigour.

293. Amblyopia from Mercurial Poisoning.

CORONAT (*Lyon Méd.*, January 24th, 1909) records a case of amblyopia, which he believes was due to chronic poisoning by mercury. His patient, a medical man, was accidentally inoculated with syphilis on the eyelid. He took mercury for ten years in large doses, continuing the treatment for three months at a time with no interval longer than a month. At various times he showed signs

of the mercurial intoxication, such as colic with haemorrhagic diarrhoea, pyrexia, and a scarlet rash. Later paresis of the deltoids and intercostal pains showed involvement of the nervous system before any ocular symptoms were noticed. Paresis of accommodation occurred five years after the beginning of the treatment. The ocular symptoms were always aggravated by a renewal or increase of the mercurial dosage. In each eye a central scotoma was the first phenomenon. In the left eye, which was first affected, this remained small and unaltered for a year; blindness did not occur till after an aggravation of the intoxication, which was shown by other grave accidents such as vomiting and diarrhoea. In the right eye the central scotoma was uncomplicated until, in addition to the usual dosage of mercury, five injections of atoxyl had been given. The papillary atrophy of syphilis, whether associated with tabes or not, seldom begins with a central scotoma; indeed Coronat believes that where this does occur it is due to a superadded intoxication, especially alcoholism. In tabes, the ophthalmoscopic changes in the papilla are often accentuated when the vision is relatively good. In Coronat's case vision was reduced to mere perception of light and darkness, although the papilla was relatively of good colour. Optic atrophy has not been hitherto considered as a complication of mercurial poisoning, but in the case recorded the dosage was altogether abnormal both in amount and in duration.

OBSTETRICS.

294. The Oedema of Pregnancy.

RUDAUS (*La Clin.*, January 15th, 1909) writes that oedema in obstetrical practice is generally regarded as a symptom of albuminuria requiring the treatment suitable for this affection, or as the result of impeded circulation due to the increase in the size of the uterus and consequent abdominal pressure. There is another form of oedema which is not accompanied by any trace of albumen, and which appears too early in the pregnancy to be due to the presence of the enlarged uterus. The patient will be found to be suffering from some minor ailment of the liver, kidneys, intestines, or possibly the thyroid or suprarenal bodies. Or she will have gastric disturbance, headaches, and neuralgia. A careful examination of the urine will show that, although there is no albumen present, the quantity excreted is below normal. A pregnant woman should excrete from a pint and a quarter to a pint and a half of urine in twenty-four hours, and this quantity often falls to less than a pint. When oedema appears it should be systematically measured. Further examination will show a diminution in the amount of urea and chlorates present, while the arterial tension is higher than normal. Treatment entails rest in the recumbent position, a daily morning dose of magnesia, and diuretic beverages during the day, such as *uva ursi*, with two teaspoonfuls of lactose. Salt must be omitted from the diet, which, however, may include pepper, lemon, and vinegar, as well as the following articles: Vegetable soups, white meats, fresh-water fish, eggs, potatoes, rice, peas, haricots, carrots, artichokes, and salads, cream and cooked fruits, bread without salt, and as drinks, milk, Evian water, or some other mineral water.

295. Acute Gangrenous Appendicitis Occurring during Pregnancy and Labour.

LOBENSTINE (*Bullet. Lying-in Hosp.*, City of New York, September, 1908) considers that attacks of appendicitis are not infrequent during pregnancy. The development of such attacks is favoured by the greater degree of constipation existing under these circumstances. In those cases in which the appendix, from a previous attack, has become adherent to the uterus, tubes or ovaries, such attacks are more likely to be renewed, owing to the increased traction or pressure on the appendix, meso-appendix, or caecum. The milder cases are not easily diagnosed, the pain being mistaken for a threatened miscarriage, a salpingitis, or ureteritis. In the really severe cases one has to remember that at the onset of the attack they may be confused with cases of acute idiopathic pyelitis of pregnancy, or with the symptoms of torsion of the pedicle of an ovarian cyst. Palliative treatment is the best in the milder cases, while in the severer an operation is desirable at once, as in the non-pregnant state. The choice of incision lies between that of McBurney and that of Deaver, at the outer border of the right rectus muscle. Either of these incisions secures a firm abdominal scar. The anatomical landmarks are often much altered: the appendix may be higher than usual or else bound

down and posterior to the uterus. Extreme gentleness of manipulation is requisite, since from the severity of the inflammation or from rough handling the patient may abort or go into premature labour. If uterine contractions begin soon after the operation, adhesions that are forming are almost invariably torn asunder, and the infection may rapidly become generalized. The author gives his notes upon five such cases, in which operation was undertaken and a gangrenous appendix removed: two of the patients aborted, and three died of general septic infection. These cases were not brought for treatment until peritonitis was severe and the general infection well marked. If the operation is an early one, and if it is conducted with care, and particularly if the inflammation is not too extensive, the patient may proceed to term. Induction of labour is not justifiable, since pregnancy may not be interrupted; and the induction itself in the presence of a severe process may add much to the gravity of the condition.

GYNAECOLOGY.

296. Appendicitis and Disease of the Female Genital Organs.

PAUL PROFANTER (*Wien. klin. Woch.*, No. 11, 1909) calls attention to a report, presented to the Berlin Medical Association, on 400 cases operated on for appendicitis, of which between 9 and 10 per cent. had proved to be suffering from some complaint other than appendicitis. Such a report emphasizes both the difficulty of and the necessity for a right diagnosis. Profanter gives a list of the many conditions which may be mistaken for appendicitis, but deals especially with pseudo-appendicitis nervosa and with diseases of the adnexa. In pseudo-appendicitis there is great tenderness at or near McBurney's spot, and it is this tenderness which is liable to cause errors of diagnosis. Dretzel has pointed out that the tenderness in pseudo-appendicitis differs from that in all other affections of abdominal organs in which the peritoneum is implicated, in that it tends to grow less and often disappears shortly after gradual, deep, strong pressure, instead of increasing in intensity. Profanter quotes Lanz, Keith, and Obratow in support of his view that pain at or about McBurney's spot is present not only in appendicitis but also in inflammatory affections of other organs in the abdominal cavity if the inflammation has affected the sensitive parietal peritoneum. He deals with the extent to which the sympathetic system is involved in inflammatory disease of abdominal organs, in order to explain the pains felt in other and distant parts of the body and the pain which in appendicitis or in disease of the adnexa or other abdominal organs may be felt on the sound side when it is absent on the diseased side, perhaps because the sympathetic nerve plexus is anaesthetized by the pressure of inflammatory oedematous swelling. The diagnosis between appendicitis and disease of the adnexa may be a matter of enormous difficulty. In a large proportion of all women during the period of full sex activity—a proportion which Profanter would put as high as one-half—the appendix has sunk in the abdomen so as to become for practical purposes a pelvic organ, while in a few cases the tubes rise so high as to be near to a normally situated appendix. In such cases the diagnosis will present especial difficulties, and also infectious disease of the appendix is likely to spread to the adnexa and vice versa. With normally situated organs a possible direct peritoneal connexion between the appendix and the right ovary by means of the so-called ligamentum appendiculo-ovarium and the connexion by means of the retroperitoneal connective tissue have to be considered. The intimate connexion between the appendix and the female genital organs explains the especial liability of women to an attack of appendicitis at the time of menstruation. Different methods of physical examination are suggested as helpful in establishing a diagnosis of appendicitis. Roving finds that strong pressure of the descending colon inwards and upwards in the left iliac fossa will elicit, in appendicitis, the characteristic pain at McBurney's point. Plönies, in palpating the abdomen, employs finger percussion as a means of overcoming the muscular tension of the abdominal wall. Bimanual examination is the most important method of distinguishing between disease of the appendix and the adnexa, and Profanter advocates that the examination should be made while the patient is in a bath, in order that advantage may be taken of the effect of the water removing intra-abdominal pressure and the tension of the muscular wall, and the patient is able to help the diagnosis in a way impossible when an anaesthetic is

given by recognizing the points of greatest tenderness. According to Berthomieu it is important to recognize that in chronic appendicitis, but not in diseases of the tubes, the pain of palpation in the ileo-caecal region may be greater when the patient is on her left side than when she is in the customary dorsal position. Cases of so-called menstruation colic in virgins may be due to latent appendicitis, and both the history and the bimanual examination may be deceptive, because a congested, and, at that particular time, tender ovary, may be held to be the cause of the pain. In bimanual examination in disease of the right tube the pressure of the finger upon the uterus is painful, and the right wall of the vagina is painful and rigid—conditions which are not found in appendicitis. In general, appendicitis is more acute in its onset, the general condition is more profoundly affected, and the typical facies peritonealis more often seen. In pregnant women, where the diagnosis may be unusually difficult, the appearance of vomiting accompanied by fever would be in favour of appendicitis. In rupture of a tubal pregnancy there is the history, the increase in size of the uterus, and until the blood clots, the shifting dullness, and also the evident signs of collapse. Shortly put, the three chief points in the differential diagnosis between appendicitis and disease of the adnexa of the right side are, the anamnesis, the general condition, and the bimanual examination.

THERAPEUTICS.

297. Magnesium Sulphate in the Treatment of Tetanus.

MILLER (*Amer. Journ. of Med. Sciences*, December, 1908), from a summary of the 13 previously reported cases of tetanus treated with magnesium sulphate injections (10 subarachnoid, 3 subcutaneous), points out the value of this method of treatment, and reports a case of a boy, aged 7 years, in whom eleven lumbar punctures were made in thirteen days, approximately 2.5 c.cm. of a 25 per cent. solution of magnesium sulphate being injected into the meninges at each puncture. Extensive paralysis, lasting from eighteen to twenty-nine hours and involving all muscles except those of the head, neck, and diaphragm, followed each injection. From being in violent spasm and continuous opisthotonos, the patient was reduced in a few minutes to complete and lasting relaxation by an intraspinal injection of magnesium sulphate, and this result, as compared with the treatment by sedatives, was obtained much more promptly and efficaciously. The chief danger lies in the directly depressing effect such injections may produce upon the respiratory centre, an effect produced in this case after the third injection, but, in spite of this, the pulse remained good, and, as a precaution, the head was elevated after the third and during subsequent injections in order to prevent the injected fluid reaching directly to the respiratory centre. A profuse secretion of mucus, sufficient to embarrass respiration, frequently followed the injection, but this was easily controlled by atropine. After each injection, paralysis of the legs, abdominal walls, and sometimes the arms, appeared within thirty to sixty minutes, the muscles of the face remaining unaffected. It was necessary to catheterize the patient for retention of urine from the fourth to the eleventh injection, but the bowels moved involuntarily throughout, though no purgative effect was noted from the absorption of the magnesium sulphate. From the experience of this case and from a summary of the 13 previously reported cases it would appear that by this method it is possible to produce complete muscular relaxation in almost all cases of tetanus, thereby benefiting the patient by preventing the rapid exhaustion due to the convulsions and making the administration of nourishment possible.

298. The New Arsenic Compounds and their Action on Trypanosomes.

THE researches of Ehrlich have led to the preparation and employment of a number of arsenic compounds in the treatment of trypanosomiasis in rats. Starting from atoxyl, Ehrlich has succeeded in producing a large number of its derivatives, and some of these are said to be as active as atoxyl and less toxic. H. Wendelstädt has been enabled to experiment with some of these preparations, and records the results in the *Berl. klin. Woch.* of December 21st, 1908. These include (1) para-oxyl-benzylidene arsanilic acid, (2) tri-oxyl-benzylidene arsanilic acid, (3) arsaetin (acetylated arsanilate of sodium), (4) arsenophenyl glycin, which had been prepared in flasks, and

which had partially undergone dissociation and partially oxidized into arsenic oxide phenyl glycin, as well as (5) pure arseno-phenyl glycin prepared *in vacuo*. (In the following abstract the various preparations will be called by the number to obviate the repetitions of the long chemical names.) It was found that 0.075 to 0.09 gram per 100 gram body weight was required to protect rats infected with nagana trypanosomes for a time. Recurrences were noted, and the reinjection of the preparation succeeded in protecting the animals for increasingly short periods, until at last even large doses proved inactive. When 0.015 to 0.01 gram per 100 gram body weight of the preparation No. 2 was employed, the blood of the rats was kept free from trypanosomes for a few days, while smaller doses only lengthened life without killing off the protozoa. Rats infected with nagana trypanosomes were permanently cured by injections of 0.03 to 0.09 gram of No. 3 per 100 gram body weight. When infected with "arsanil-fast" trypanosomes, this preparation proved inactive. The cured animals exhibited marked tremors for some time after recovery. No. 4 preparation proved to be unstable. When quite fresh, 0.005 to 0.01 gram per 100 gram body weight cured permanently, while after two months 0.005 to 0.009 gram killed the rats in from two to four days. The older preparation, however, achieved permanent recovery in doses of 0.003 to 0.004, which doses were insufficient when fresh preparation was used. Number 5 preparation—that is, the vacuum preparation—proved to be stable: 0.008 to 0.025 gram sufficed to cure permanently, while 0.005 to 0.007 gram only turned the trypanosomes for a week. A monkey which had been infected with nagana trypanosomes, and whose blood showed numerous protozoa, was cured by two injections of 0.025 gram. No recurrence has taken place up to the present. No. 4 preparation revealed a great disadvantage in that, on dissociating and oxidizing, the products became highly toxic, and blindness, among other symptoms, was produced by therapeutic doses of the compound. No such unwished-for effects were seen in the vacuum preparation, which appears, therefore, to be an almost ideal medicament in nagana trypanosomiasis in animals.

299. Rectal Injections of Red Wine for Infantile Diarrhoea.

HOUSAY (Rev. Franc. de M^{d.} et de Chir., January 25th, 1909) speaks highly of the procedure of washing out the lower bowel with warm wine in severe cases of infantile diarrhoea. Realizing that the ordinary red wine of France is a natural and physiological antiseptic, being a tannic and alcoholic solution, he has employed it in summer diarrhoea for some time, and he recalls to mind the fact that it was used as long ago as 1880 in Cochinchina. He injects one litre on the first day, and afterwards two litres daily until the stools become normal. A double cannula facilitates the operation, and it must be understood that it is a washing out that is required and not an enema. Old wine, rich in alcohol, is not suitable for the purpose.

PATHOLOGY.

300. Latent Microbiom of Typhoid Bacilli.

Er latent microbiom H. Lüdke (M^{unch.} med. Woch., January 12th, 1909) means the vegetation of living or viable germs in the animal organism, without any manifestation of the clinical illness which is pathogenically produced by the bacteria in question. During the last few years support has been forthcoming for the theory, and has taken the form of the discovery of healthy bacillus-carriers in whose gall bladders and intestines typhoid bacilli can be found. Similarly, persons are met with in whose fauces pathogenic diphtheria bacilli, streptococci, and pneumococci are found, in spite of the fact that the individuals remain quite well. Meningococci have also been found in the naso-pharynx of healthy persons. There is no doubt that, at all events, the bacilli gained from typhoid carriers and diphtheria carriers are virulent to other persons or animals. The author next adduces evidence that various pathogenic bacteria may be present in apparently healthy normal tissues. In order to understand the process better, he considers it necessary to consider the life of latent germs in the circulating blood. In animals the cholera vibrio disappear out of the blood after from twenty to forty minutes; *B. pyocyaneus* disappear after six hours and *B. typhosus* after about twenty-four hours. Pneumococci have been demonstrated in the blood of infected animals for weeks. Bruce found *Trypanosoma gambiense* in the blood of 23 out of 29 perfectly healthy negroes. In order to determine the latency of typhoid bacilli in the circu-

lating blood, Lüdke has performed a series of experiments which show that six days after intravenous injection no typhoid bacilli can be cultured from the blood, when one-tenth of a loopful of culture was introduced. After the injection of one-fifth of a loopful, bacilli were still found on the sixth day, while, after half or a whole loopful, bacilli were found on the eighth day. He points out that in order to determine the presence of bacilli, it is necessary to use comparatively large quantities of blood. In human subjects, typhoid bacilli were found in the blood of 95 per cent. during the first week, in the blood of 50 per cent. during the second week, in the blood of 18 per cent. during the third week, and in the blood of 10 per cent. during the fourth week. In recurrences, the bacilli which have been lying dormant in organ depôts again appear in the blood. He next shows, on the strength of two cases, that typhoid bacilli can be present in the blood of patients after the fever has disappeared. Investigating the latency of the bacilli in the organs in animals, he found that the spleen and bone marrow contain bacilli for about two weeks after intravenous injection of one-tenth of a loopful of culture. He adduces evidence in favour of the bacilli being carried to the organs by the blood. It is extremely difficult to determine whether typhoid bacilli increase in the organs. Certain changes in the bacilli can be shown to take place in the organs. Bacilli which have been cultured from the organs show increased resistance toward the various forms of serum activity. For example, a strain was obtained from a typhoid carrier, which was proved by agglutination, by the capability of producing a bactericidal immune serum in guinea-pigs, by the fact that immunized guinea-pigs were immune to this strain, and by all the cultural characteristics, to be true typhoid bacilli. These bacilli were not affected by Pfeiffer's test in a concentration of over 1 in 20. The loss of reaction toward the lytic serum might have caused some doubt as to the nature of the bacilli had the other investigations not been carried out. Next he cites examples of the persistence of bacilli in an organism in which a high degree of protective power was found. The agglutinating value of the serum may rise as the bacilli disappear out of the serum. Cases are given in support of this. Lastly, he finds experimentally that a long latency of typhoid bacilli in the organ produces a loss of virulence, while a passing over to the blood takes place concurrently with an increase of virulence.

301. Gall Stones and their Cholesterin Constituents.

ADAM (Western Canada Medical Journal, January, 1909) publishes the results of some recent investigations upon the composition of gall stones, especially with reference to the cholesterin constituent—how it comes to appear in the bile, how it is liberated, and what are the factors leading to the formation of calculi. Cholesterin is either excreted and is present in normal bile as a chemical compound soluble in the bile and subsequently undergoing dissociation with liberation and precipitation of the crystalline cholesterin moiety, or it passes through the cells in a state of solution and becomes precipitated later owing to altered conditions in the bile. The stagnating bile in the gall bladder contains a much larger amount of unprecipitated cholesterin than does fistula bile, and it is there associated with fats, soaps, and lipid substances, lecithin, etc.—gall bladder bile containing five times as much fats, and thirteen times as much soaps as that flowing freely from a biliary fistula. In the blood cholesterin is present in the form of cholesteryl esters, and the only known bodies which assume the fluid crystalline state at the room temperature are sundry oleic acid compounds. It would appear that the myelin globules in the gall bladder epithelium and Naunyn's amorphous cholesterin are essentially cholesteryl oleate which normally passes in solution into the bile, but which, under certain conditions in the gall bladder, is liberated in a solid state, tending to collect into clumps, while under other conditions precipitation of crystalline cholesterin occurs. With dissociation of the cells the myelin cholesteryl oleate is liberated, which under the action of pure alkalis in the bile becomes dissociated and the cholesterin precipitated, the fatty acid being converted into soaps which tend to become absorbed. It is concluded that cholesterin is capable of existing in the organism in definite combination with fatty acid and lipid substances, and that in the form of this easily soluble compound it is excreted into the bile, where it may become dissociated, either undergoing solution in the presence of fats, soaps, etc., or, where such solvents are inadequate, undergoing precipitation, and so becoming portions of gall stones.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

302. Estimation of the Functional Activity
of the Pancreas.

H. SCHLECHT (*Zentralbl. f. inn. Med.*, February 6th, 1909) has devised a method of testing the functional activity of the pancreas which is based on that of Müller and Jochmann for the detection of proteolytic ferments. Experiments with Löffler's serum showed that the proteolytic ferment contained in faeces is trypsin. The presence of pepsine and the proteolytic ferment of leucocytes was excluded. That the ferment could be derived from intestinal bacteria was rendered improbable by the quantity of ferment being least in those parts of the intestine in which bacterial decomposition was most active. Finally, the faeces of a dog were found to contain no ferment twenty-four hours after an operation had been performed to prevent the entrance of pancreatic juice into the intestine. To estimate the functional activity of the pancreas the following procedure is employed: The lower bowel is cleared out by a large enema or injection of glycerine early in the morning. A test meal is then given consisting of 150 grams of meat and 150 grams of mashed potatoes ("Kartoffelbrei"). An hour later a brisk purge is administered, such as 0.2 gram (3 grains) of calomel, or 0.5 gram ($\frac{7\frac{1}{2}}$ grains) of purgen, or 0.2 gram of calomel with 0.5 gram of purgen. Two or three watery stools usually occur two or three hours later. To determine whether the faeces contain trypsin, a few drops of the faeces are placed with a platinum loop on a plate of Löffler's serum, which remains in the incubator at 50° or 60° C. for twenty-four hours. If the faeces contain trypsin a depression forms under each drop. This becomes apparent if much ferment is present after about thirty minutes. If no depression is formed within twenty-four hours trypsin is certainly absent. If the faeces are pulsatious they should be rubbed up with 10 grams of glycerine and 100 c.cm. of water before being "sown" on the plate. As trypsin is most active in an alkaline medium, it is important to test the reaction of the faeces and, if necessary, to render them alkaline with a weak solution of caustic soda. If much fat is present it should be removed by agitation with ether. If the stools are diluted in a graduated pipette the method may be used for approximate quantitative estimations. If the test is positive—that is, if a depression forms on the Löffler plate—the pancreatic duct is certainly patent, but an organic disease of the pancreas is not excluded, with the possible exception of an extreme result as regards digestion of the plate. Great diminution of the normal digestive action of the faeces suggests pancreatic disease. But within fairly wide limits diminution merely indicates diminution of pancreatic secretion, such as is common in carcinoma of the stomach, gall stones, catarrhal jaundice, and chronic constipation. If the result is negative, obstruction of the pancreatic duct or a severe lesion of the pancreas may safely be diagnosed. The test is also useful in cases in which pancreatic disease is clinically obvious, to ascertain to what extent the pancreatic function has suffered. It is of interest that in normal persons the tryptic activity of the faeces was uninfluenced by diet or diminution of the acidity of the gastric juice by administration of large doses of bicarbonate of sodium. In the few cases of diabetes mellitus examined the results were inconclusive; in some the tryptic action was very slight, and in others (the minority) almost normal. The writer has recently modified the method to avoid the trouble of preparing Löffler plates. Capsules of hardened gelatine, similar to Sahli's guttoid capsules, are filled with powdered wood charcoal. One of these is added to a tubeful of diluted faeces, which is then placed in the incubator at 37° C. If trypsin is present the capsule is digested and the faeces become coloured black in from thirty minutes to twenty hours. If the capsule has not dissolved within twenty-four hours trypsin is absent.

303. Late Rickets.

FALAGI (*Archiv. di Ortoped.*, An. 26, f. 1, 1909) gives the results of a study of 28 cases of this condition seen by him at the Hospital for Rickets in Milan, and on the recorded cases of others. Heredity does not seem to play an important part in the etiology of the disease; for example, of

the authors 28 cases only 3 had brothers who suffered from rickets in early infancy and 5 had a doubtful history of rickets in collateral relations. An acute illness will sometimes be followed by late rickets (the author quotes 2 cases). The chief exciting cause, however, seems to be more or less laborious work at the time of early puberty. The usual age of onset is between 12 and 15 years, and 17 out of the 28 cases were females. The first symptom is pain, usually in the lower limbs, especially the knee. It is generally the joints, or their neighbourhood, that are affected, the shaft of the bone not being painful. The pain is not very severe and is in relation to the work imposed on the limbs, hence repose usually relieves it. Shortly after the pains come on, there appear the epiphyseal enlargements. There is nothing particularly noteworthy in the general condition of these patients. The muscular hypertonus and increased tendon reflexes cannot be relied on as a differential mark between the disease in question and osteomalacia. There are no visceral changes. The gait is characteristically altered. Some confusion may arise between an unusually prolonged case of infantile rickets, a syphilitic epiphysitis, and juvenile osteomalacia; in all these cases much help can be derived from radiography, and the author goes very carefully into the radiographic appearances best seen in the knee. The course of the disease is slow and the prognosis generally favourable. In treatment the best results are obtained by phosphorus dissolved in cod-liver oil. The deformities may need operative treatment. Genu valgum may in some cases be a local result of late rickets which is itself a general disease. Probably juvenile osteomalacia is so closely akin to late rickets that the two are almost identical, and the author quotes a case strongly in support of this. Details of 30 cases are given and a bibliography of 88 references.

SURGERY.

304. Post-operative Pulmonary Embolism.

LENORMANT (*Arch. Gén. de Chir.*, No. 3, 1909) bases on four records of the occurrence in his surgical practice of pulmonary embolism after operative intervention a full and instructive discussion of this complication, which he states is by no means an exceptional event. These four instances were observed in a series of 792 diverse operations, and in statistics of von Eiselsberg's clinic pulmonary embolism is noted to have occurred in 57 out of 6,800 operations. This low proportion may, however, be much increased by taking into consideration only those operations that have been practised on the contents of the pelvis and the lower region of the abdominal cavity. Post-operative pulmonary embolism, it has been shown, occurs in a very large majority of instances in connexion with surgical intervention for appendicitis, for diseases of the female genital organs, and for the relief of strangulation or for radical cure in cases of hernia. The original thrombus constituting the starting point of the post-operative embolism has on *post-mortem* examination been found in some cases at the seat of the operation, in other cases at some distance from this in the femoral and iliac veins, which in 90 per cent. of instances, and even after operations on the appendix and right inguinal hernia, are exclusively those on the left side. In the first class of cases the formation of the thrombus may, it is stated, be readily explained by surgical traumatism or by local infection. Many suggestions, such, for instance, as disturbances of the circulation and alterations of the blood, cardiac lesions produced by chloroform, and the abnormal conditions imposed on the patient during the after-treatment, have been made to account for the development of a distant thrombus, but each of the suggested factors, the author holds, is quite incapable by itself of causing the complication. Thrombosis, he believes, is always caused by phlebitis, and support is given to the view held by many German surgeons that post-operative thrombosis and embolism are septic lesions. The infection may be so slight as to be clinically inappreciable, but still, the author asserts, it exists. It is difficult to account for the migration of the whole or a portion of the clot to the heart and lungs in those cases in which post-operative embolism has its origin in an organ—the

intestine, omentum, or appendix, for instance—the veins of which belong to the portal system. The author holds that it is necessary to assume in such instances the extension of the thrombosis to the porto-caval anastomoses formed by the retroperitoneal veins, and also, in cases of appendicitis, the existence in adhesions of new-formed vessels establishing a communication between the appendicular veins and the veins of the abdominal wall. The pulmonary lesions vary in character and intensity in accordance with the size of the embolic clot. Large emboli arrested in the trunk or primary divisions cause speedy death by syncope, whilst minute emboli are carried into the lung, in most cases into the lower lobe of the right organ, and there set up haemorrhage, infarction, or, in cases of well-marked infection, supuration or gangrene. The relative frequency of these different lesions is indicated by the statistics of Ranzi, who found that of 57 cases of post-operative embolism, 23 were rapidly fatal; that in 20 there were symptoms of pulmonary infarction, and in the remaining 14 symptoms of embolic abscesses. Post-operative embolism is sometimes preceded by evident signs of thrombosis of the veins of the lower limb, but in most cases, especially in those in which the deep-seated veins of the abdomen and pelvis are affected, the first symptoms occur in the chest. The length of the interval between the operation and the embolic attack varies very much in different cases. One instance has been recorded of sudden death within the first twenty-four hours, and in others the complication was delayed for three months. The author states that the first signs of the attack usually occur from the tenth to the twelfth day after the operation. The symptoms of post-operative distinguished from other forms of embolism present no special characters. The attack may cause sudden or speedy death from syncope or asphyxia, or it may be almost latent and result only in slight pain and scanty expectoration. The prognosis, it is pointed out, is extremely grave. Many of those who are not carried off suddenly succumb sooner or later to infective lesions such as pneumonia, abscess, and gangrene. Statistics of 233 collected cases show a death-rate of 45.5 per cent., but this, it is suspected, fails to express the absolute mortality of post-operative embolism. In discussing the preventive treatment of this complication, Lenormant insists on the importance of careful preparation of the patient before any serious operation, of strict attention to aseptic details, and gentle dealing with large veins during the intervention, and of prolonged and complete rest during the after-treatment. He directs special attention to this last condition, and strongly opposes the views of those who have recently advocated a very early release from bed after laparotomy. Very little, he holds, can be done by the surgeon after the development of thrombosis and embolism. A proposed attempt to prevent embolism in cases of thrombosis of the femoral vein by proximal ligation is regarded as useless, as the thrombosis in such cases has usually involved the deep pelvic veins. This paper ends with a review of the methods of treating those severe forms of pulmonary embolism in which immediate death is feared, by direct massage of the heart and by direct removal of the large clot after exposure and incision of the pulmonary artery. The latter method, proposed and practised by Trendelenburg, has hitherto failed, but Lenormant thinks that the records of this very formidable and difficult operation justify some hope, and should encourage surgeons to make fresh endeavours.

305. Operative Treatment of Carcinoma of Penis.

NICOLL (*Ann. Surg.*, February, 1909) describes an operation for the removal of penile cancer which he has practised during the past fourteen years. The object of this method is the removal *en masse* of the primary carcinoma, the fat and glands of the groins, and the lymphatic vessels intervening between the primary growth and the area of actual or probable secondary extension. It is pointed out that epithelioma of the penis primarily extends along the dorsal lymphatic channels on either side of the blood vessels, and affects the superficial and deep inguinal glands above the brim of the pelvis. The author holds that only late in the progress of the disease does the growth infiltrate the corpora cavernosa and thus reach the lymphatics under the pubic arch, and, through these, the intrapelvic glands. When such infiltration of the proximal portion of the penis and invasion of the intrapelvic glands have occurred, the case in a vast majority of instances may, it is stated, be regarded as inoperable. The operation of bisecting the scrotum and removing the whole penis together with the corpus, it is stated, be possibly justifiable in only a few cases. The author's method, which is adapted to the usual operable case in which the anterior fourth or third of the

penis is involved, with possible extension of the disease along the dorsal lymphatics to the inguinal glands, is carried out through a Y-shaped incision, each arm of which extends from the root of the penis towards the superior iliac spine, the leg being carried along the dorsum of the diseased organ, and terminated in a loop around this organ in front of its proximal fourth. The fat and all lymphatics and glands are dissected out *en masse* from both groins. In cases in which this step is indicated, the fascia just below Poupart's ligament is opened, and after exposure of the femoral sheath and repression of the peritoneum, the fat and glands along the external iliac vessels are excised. In the next stage the dorsal blood vessels and lymphatics of the penis, together with all investing fascia, are dissected out. The dorsal arteries and veins are tied close to the pubes at the suspensory ligament. The fat of the groins and the fascia and vessels of the dorsum of the penis form one continuous mass containing the unbroken lymphatic channels. The corpus spongiosum and corpora cavernosa are now cut through, the first, together with the divided urethra, being left rather longer than the latter bodies. Drainage of the wounds in the groins is necessary as removal of the fat and glands of this region is followed by lymphorrhoea, a result, the author states, that is unknown in the axilla after excision of mammary cancer.

OBSTETRICS.

306. Indications and Technique of Forceps Delivery.

H. SELLHEIM (*Deut. med. Woch.*, April 1st, 1909) attempts to set up definite indications for the application of forceps to terminate labour. In cases of uterine inertia, he considers that forceps may be used if the reaction on the part of the mother, properly and repeatedly applied, is absent. Hot "sitz" baths or full baths are used for this purpose, and if, after several hours, no responding pains set in, if the local condition reveals that the birth will not be completed for a long time and the uterus does not appear inclined to assist itself further, he believes that it is a mistake to wait longer. He speaks strongly against the application of the forceps to please the patient. The mechanism of birth when completed by forceps is identical with that when Nature completes it herself, and, when properly applied, the traction on the forceps can replace in every sense the expelling power of pains. Traction must be made in the proper direction, but the handles of the forceps show which this direction is. Nature assists even when forceps are applied, and the obstetrician must take his hints from her. In the same way, rotation takes place automatically when forceps are being used, provided that the traction is applied in a skilful manner, in which the automatic following of the curves of the pelvis is permitted by the steering hand and not acted against. It may be necessary, however, to rotate artificially in certain cases. At times, when the fetal head does not rotate when it should, the blade of the forceps should be used to carry out the rotation, but it must always be borne in mind that under abnormal anatomical conditions, an abnormal mechanism may be required, and that unusual methods of completing labour may be the best. Before applying forceps both rectum and bladder should be emptied. In easy cases the patient is placed transversely across the bed, but in cases in which difficulties are anticipated she should be placed on a suitable table. The preparation of the operator, instruments, and patient must be the same as is required for any modern instrumental intervention. The legs may be held by the most promising looking person to be found in the house. Anaesthesia is desirable and should be deep to protect the perineum from rupture. No anaesthesia is better than bad or superficial anaesthesia. Before the forceps are applied the parts should be again examined. The blades of the forceps should be applied by adapting them to the head. The directing finger should precede the tip of the blade in order to ensure that the maternal soft parts are not included, whenever this is possible. All folds of skin and hairs must be carefully pushed aside before the blades are locked. Trial traction is necessary to satisfy that the forceps are properly applied to the fetal head. The extraction should be conducted in a manner calculated to imitate the natural mechanism of labour. The progress must be continuously controlled by the examining finger. In occipito-anterior presentations the most favourable conditions are met with, but no difficulty should be experienced when the forehead or face enters the pelvis in the corresponding manner. When the occiput, forehead, face, or coronary suture presents in an oblique position, the forceps may be applied either in the adaptation optimum for the head or in the adaptation optimum

for the pelvic canal. It is generally wiser to choose the adaption optimum for the head, and to accept the slight difficulty arising from the canal. The head having been properly secured, less damage is likely to ensue to the pelvis than would ensue to the head if the canal were the first consideration. When the head presenting by the occipito-posterior refuses to obey the usual mechanism of these presentations, or when trial traction tends to rotate the posterior fontanelle backwards, an attempt should be made to convert the presentation into an occipito-anterior. The forceps with the concavity corresponding to the pelvic curve turning to the forehead, are applied to the head in that diameter oblique of the pelvis in which the sagittal suture is not placed, and attempts are made to push the forehead to one side. The finger must govern each movement. As soon as the sagittal suture lies in the transverse diameter, the forceps are taken off and reapplied in the reverse direction. The occiput is then directed forwards and the forehead backwards. A similar scheme is followed in face presentations with the chin pointing backwards. Next the author speaks of the high forceps operation. He mentions that this operation is only permissible as an experiment, and it must always be recognized that the usual conditions for a forceps operation are not fulfilled—namely, that the head should be completely in the pelvis. Under any circumstances the high operation may only be attempted by an experienced hand. The head must be easily grasped by the forceps, and may not slip off at the trial traction. In presentations with the temporal bone looking backwards, in high forehead or face presentations, and when the anterior fontanelle is lying low down, the forceps always slip off. It must further be remembered that this operation cannot save a child which is showing signs of dying. The last word of warning is that if the attempt is made and fails, only perforation remains to help the mother. The blades should be applied in the transverse pelvic diameter. The finger should attempt to guide them as far as possible, but it is always possible that the points of the blades may compress the cord which lies around the neck. Before closing he warns the practitioner not to apply force when skill suffices.

GYNAECOLOGY.

307. Vermiform Appendix adherent to Fibroid with Twisted Pedicle: Appendicitis Simulated.

PILLET (*Annales de Gyn. et d'Obstét.*, April, 1909) reports that a single woman, aged 35, was seized in the night with a sharp attack of pain in the hypogastrium and right iliac fossa and vomiting of food, mucus, and at length bile. On the next day there was marked muscular resistance over the iliac fossa, the features were drawn, the pulse 120, but the temperature low. A few days later Pillet examined the patient; the muscular resistance then extended all over the abdomen. He diagnosed appendicitis, yet believed axial rotation of an ovarian cyst to be possible; but there was no history of any other symptom of any kind associated with ovarian new growths. At the end of a month the period set in and lasted for three days without pain. A mass as big as an orange could be defined, through the rectum, lying to the right of the uterus and continuous with deposit filling the corresponding iliac fossa. Four weeks later, as there was no diminution of the swelling and exudation, Pillet operated through a lateral incision. He found that the mass of the size of an orange was a necrotic fibroid, to which two-thirds of the vermiform appendix adhered. There were other adhesions: on separating them the bladder was damaged, but repaired at once. The uterus was amputated above the cervix and the appendix excised. There were no complications during convalescence. A considerable number of cases of axial rotation of pedunculated uterine fibro-myomata have been recently published, but Pillet dwells on the adhesions to the bladder and vermiform appendix as of special surgical and clinical interest in his own case.

308. Hairpin in the Bladder.

GUILLET (*Rev. Franç. de Méd. et de Chir.*, January 25th, 1909) describes a successful operation which he undertook for the removal of a hairpin from the bladder in the case of a girl of 16. The pin had been introduced two days before, and an unsuccessful attempt to remove it had been made by the family doctor. Pain in the lower part of the abdomen was complained of. Vaginal examination revealed nothing, but a metallic sound in the bladder caused a flow of slightly blood-stained urine, and gave indication of the presence of a foreign body. Under chloroform the situation of the pin—near the neck of the bladder—having

been again made out, the cavity was distended with boric solution, and the urethra gradually dilated by means of Hegar's bougies, up to No. 13. The little finger of the right hand was then introduced into the bladder carefully and gradually, but without any difficulty. The distension of the bladder had moved the pin from its former position near the neck, but the left forefinger in the vagina soon enabled the surgeon to get the other finger in contact with it, to turn it lengthways with its closed end next the urethra, and finally to extract it safely, after some little delay. The operation was concluded by washing out vagina and bladder, hardly any bleeding having occurred. The urethral dilatation caused no incontinence, but, on the contrary, two days' retention, which passed off without special treatment, and the patient left the hospital on the fifth day.

THERAPEUTICS.

309. The Behaviour of Atoxyl in the Body.

IGERSHEIMER and ROTHMANN (*Hoppe-Seyler's Zeitschr. f. phys. Chemie*, vol. lix, p. 256) have investigated the fate of atoxyl in the organism, not only because of its value in trypanosomiasis but also to elucidate the selective action of atoxyl on the eye, its specific action on the central nervous system of the cat, and the nephritic hæmorrhages to which it gives rise in the dog, and which are seldom if ever observed in poisoning by inorganic forms of arsenic. The greater part of the atoxyl given in one dose is, according to Croux and Seligmann, eliminated in four to eight hours, but continues for some twenty-two hours in small traces in the urine. Blumenthal and Kegel obtained similar results. The authors estimate the atoxyl in the urine by a colorimetric method, which depends on the formation of an azo-dye when atoxyl (or urine containing atoxyl) is treated with α -naphthol in the presence of sodium nitrite. The colorimeter is described by Gottlieb and Stangassinger in vol. lii of the *Zeitschr. für physiol. Chemie*, and the method gives very accurate results when tested with known quantities of atoxyl dissolved in urine or water. The total quantity of arsenic in the urine and faeces was also determined by Dragendorff's method. The experiments were carried out on rabbits, cats, dogs, and man, the atoxyl being injected. Elimination was completed in five or six hours (for rabbits) and in nine hours (for men), and in one case 96 per cent. of the atoxyl was recovered from the urine of a rabbit. As the total arsenic recovered was generally greater than the atoxyl recovered, some chemical change must have taken place to a small extent. No toxic symptoms were observed, unless there was evidence from the analyses of retention in the body. Ehrlich suggested that the therapeutic action of atoxyl depends on its reduction in the organism to p-amidophenylarsin oxide; for atoxyl is not fatal to trypanosomes *in vitro*. Igersheimer and Rothmann find that this substance is not eliminated in the urine of rabbits after subcutaneous injection, so that if atoxyl were converted into it in the body, there would not have been any azo-dye produced in the urine of the experimental animals. (The two substances—atoxyl and p-amidophenylarsin oxide—produce apparently similar azo-dyes.) Moreover, the urine of the experimental animals was not more toxic than atoxyl when injected into rabbits, whereas the reduction product is extremely fatal to rabbits; therefore, they say there was, if any, only a negligible amount of the reduced body in the urine, and the substance eliminated was actually atoxyl. This conclusion harmonizes with Heffter's observation, that after injecting sodium cacodylate, it is eliminated as such and not as cacodyl. The blood of rabbits was examined after intravenous injection of atoxyl, and it was found to be present almost exclusively in the blood serum, and only in very minute traces in the corpuscles. After two hours and a half, even with saline perfusion, only very small quantities were found in the blood serum, but there was more arsenic than could be accounted for by the quantity of atoxyl present. In one of the experiments 500 mg. of atoxyl were injected intravenously into a rabbit. It was bled to death five minutes afterwards. The urine contained 8.33 mg. and the kidneys 33.74 mg. of atoxyl, and linear hæmorrhages were seen in the kidneys. Inorganic arsenates take only a few minutes to disappear from the blood after intravenous injection, or, at any rate, are only present in traces (Mori-shima). The more protracted sojourn of atoxyl in the serum may have some bearing on the therapeutic value of atoxyl in diseases caused by hæmatozoa. On the other hand, the fact that atoxyl can only be demonstrated in traces in the blood corpuscles accounts for the resistance which the malaria parasite exhibits towards atoxyl. In

the rabbit and the dog considerable quantities of the atoxyl were found in the internal organs and also in the central nervous system of the cat. Traces were found in the eye of the cat and dog, whereas injection of sodium arsenate into a cat in doses corresponding in the amount of arsenic with the quantity of atoxyl used in the previous experiments did not give rise to the least trace of arsenic in the eye. The authors agree that there may be some production of an inorganic combination of arsenic after administration of atoxyl, but only in a relatively non-poisonous form. The large amount of atoxyl in the blood after injection explains the possibility of trypanosomiasis being cured in some cases by means of a single injection. The poisonous symptoms of atoxyl are, in the opinion of the authors, due to reduction products on the one hand and to inorganic arsenic on the other, for the late symptoms of atoxyl poisoning are the same as those of arsenical poisoning—namely, conjunctivitis, rhinitis, pharyngitis, trophic skin changes—but these never occur in acute and subacute atoxyl poisoning.

310. Roentgen Rays in Malignant Disease.

PFÄHLER (*Amer. Journ. of Med. Sciences*, April, 1909) discusses the value of Roentgen-ray treatment in cases of deep-seated malignant disease in contradistinction to the epitheliomata and superficial carcinomata. Personal observations were made in the treatment of 35 sarcomata and 304 deep-seated carcinomata involving the subcutaneous, glandular, visceral, or osseous tissues; and most of the cases were recurrent, very advanced, or very malignant, and such as had passed beyond the reach of other methods of treatment. Although the Roentgen rays were used as a last resort and ultimately failed in the majority of cases, some lives were saved, or were much prolonged, while in nearly all there was some temporary benefit. Of the 35 cases of sarcoma 9, still under treatment, have markedly improved, while 65 per cent. of the remainder recovered, with a recurrence in 2. In operable cases the best results will follow operation with a thorough course of Roentgen-ray treatment immediately following. The treatment of carcinoma is not so satisfactory, though improvement was noted, and probably the greatest field of usefulness of the Roentgen rays is supplementary to operation both before and after, and this latter should be commenced within a week, approximately fifteen to twenty treatments being given. Exposures should be from ten to thirty minutes, and when over ten minutes they should be given in more than one direction, though always towards the centre of the growth. The distance of the anode from the skin should be from 10 in. to 15 in., and the deeper the lesion the greater the distance and the longer the exposure. In rapidly-growing sarcomata treatment should be daily, while in carcinomata three times a week may be sufficient, and this may have to be continued from a few months to several years, with varying intervals, depending upon the patient's condition. Localized recurrent carcinoma usually yields to treatment unless the mucous membrane is involved.

311. Action of Thyroid and Thymus Extracts on the Circulation.

CONSIDERABLE obscurity has hitherto attached to the influences exerted by extracts of the thymus and thyroid glands on the blood pressure. Some experimenters have found that they lower the blood pressure, others that they raise it. A. Farini and G. Vidoni (*Lo Sperimentale*, Florence, 1908, lxii, p. 721) find that extracts of the thyroid gland and thyroïdine both cause a local vaso-constriction, which is neither preceded nor followed by any vaso-dilatation; they attribute this to a direct action on the involuntary muscle of the vessels. Injected into the veins, however, thyroid extracts cause a notable lowering of the arterial blood-pressure, in some instances preceded by a rise. Hence there is an antagonism between the local or peripheral action of thyroid extract and its central action. The influence of extracts of the thymus is similar to, but less marked than, those of thyroid extracts; here, too, the antagonism between the central action and the peripheral action is to be observed.

PATHOLOGY.

312. The Origin of Anthrax Antibodies.

MAX GRUBER and K. FUTAKI publish the results of their experiments which deal with the resistance of animals against anthrax and the origin of the antibodies in the organism (*Muench. med. Woch.*, February 5th, 1907). The dog and hen are practically immune toward anthrax. The

high temperature of the latter (41° to 42° C.) must be harmful to the micro-organism, but the dog's temperature appears to be beneficial to its growth. Hen's leucocytes and also dog's leucocytes eat up virulent anthrax bacilli readily, while guinea-pig's and rabbit's leucocytes do not exert any phagocytic action on them. They surround the bacilli for a short time and then leave them free. However, rabbit's leucocytes are not harmless to anthrax bacilli: 0.1 c.cm. of leucocytic emulsion was capable of killing 350,000 anthrax bacilli in one hour. This action depends on the giving off of a substance which digests the protoplasm of the bacilli. This action is so strong *in vitro* that one is astonished at first that the animals have so little power of resistance against an invasion of the bacilli. In some experiments with the bactericidal action of rabbit's serum, they found that the bacilli which resisted the action of the serum were possessed of an enormously thick capsule. It proved quite easy to cultivate the bacilli in heated rabbit's or guinea-pig's serum. They found that non-capsuled bacilli, both in animal experiment and also *in vitro*, are readily attacked and surrounded, while capsuled bacilli are not attacked by the leucocytes at all. In order to find an explanation of this fact, they studied the behaviour of the various animals when inoculated in various ways. When applied subcutaneously capsuled bacilli rapidly multiply in rabbits and guinea-pigs, while anthrax bacilli die within a short time in dogs and hens, and very few capsuled bacilli are developed even when large quantities are injected. The bacilli in the last-named case die extracellularly. It thus appeared that the lymph in the subcutaneous tissue would have a specific action, and they next collected this lymph in hens, rabbits, and guinea-pigs by introducing plugs of cotton-wool under the skin. The plugs were taken out after a time, and the fluid either expressed or centrifugalized off. Lymph gained after two hours from guinea-pigs proved inert; two-hour lymph of the rabbit was not quite inert, but in a number of experiments the action on bacilli was very weak. On the other hand, two-hour lymph taken from the hen killed off all the bacilli within one hour in thirteen out of fifteen experiments. It therefore is certain that the bactericidal action in the hen is independent from the blood, since serum is inert toward the bacilli. They attempted next to determine the origin of the bactericidal substance. They were able to show that it does not originate from the subcutaneous tissue itself. Further experiments prove that the substance is derived from the action of the lymph on leucocytes. It seems as if the giving off of this substance is a normal production and not a pathological manifestation. They found that, after the tissue had been rendered oedematous in the rabbit, the oedema fluid attained the same bactericidal capabilities, and this fact is offered as an explanation for the experience that when rabbits are treated by passive hyperaemia according to Bier, they recover from an otherwise lethal dose of anthrax bacilli. Rabbit's leucocytes, however, are much less productive in bactericidal substance than are hen's leucocytes. Lastly, they found that the blood platelets of the rabbit and rat, as against those of the guinea-pig and hen, give off another substance which acts bactericidally toward anthrax bacilli. This last-named substance is given off after the blood has clotted, and in this way lends a bactericidal action to the blood serum of the two animals. It is possible that it may be present in the serum of the circulating blood when the animals are infected, and that through its influence a certain degree of immunity is produced.

313. Histology of Retained Testes.

CONFORTI (*Il Morgagni*, July, 1908) has examined 8 cases of retained testes with especial reference to their histology. In such testes it is common to find groups of tubules or single tubules at an early period of development. These tubules are for the most part grouped in nodules which Pick described as adenomatous neoformations and Lanz called atypical inclusions of seminal epithelium. In the author's view they are, as far as his researches extend, merely groups of tubules at an early or arrested period of development. The spherical and concentric bodies described by Félizet are not (as they thought) endocanalicular and formed by hyaline degeneration of seminal epithelium, but extracanalicular and originating from the basal membrane by a process of degeneration. The interstitial cells vary greatly in quantity in single cases, sometimes they may be very numerous and grouped in large nodules. Their secreting capacity is usually diminished and in proportion to the number of such cells. Their presence is not so much a kind of compensatory hypertrophy as a result of disturbed evolution acting both on the seminal canaliculi and on the interstitial cells.

AN EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

314. Habitual Constipation in Infancy as a Cause of Death.

B. GLASERFELD (*Berl. Min. Work.*, March 22nd, 1909) finds that habitual constipation in infancy is very scantily dealt with in medical literature, although the same condition in adults commands great attention. The condition in infants is extremely common, and frequently is very difficult to treat. It is usually unaccompanied by morbid processes, and rarely leads to a fatal termination. Since the author has been able to observe a case which terminated fatally, he considers that the details are worth publishing as a contribution to the pathology of this condition. The patient was born on June 2nd, 1908, and weighed 3,000 grams. The organs appeared to be healthy. No meconium passed until an enema was given on the seventh day. It was fed at the mother's breasts but no spontaneous motion was evacuated. In response to water enemata, hard but otherwise normal stools were passed. Abdominal massage was resorted to without appreciable benefit. On October 4th the infant had to be weaned on account of illness of the mother—appendicitis, necessitating an operation—and from that time onward cow's milk, various infant's foods, etc., were given fair trials. In the following nineteen days the infant lost 450 grams, and the constipation remained very obstinate. Glycerine enemata, castor oil, camomile infusion, water salt solution, and other substances as enemata, syrup of rhubarb *inter alia* were used to produce motions. On a few occasions scybala had to be mechanically removed from the rectum. On December 20th no motion could be obtained. Fever appeared on the 22nd. The rectum was empty, flatus passed plentifully, and there was marked tympanites. An operation was decided on, and this was carried out on the 23rd. As soon as the peritoneum was opened faecal-smelling gases escaped, and thin pus was found in the cavity. The appendix was natural, but there was marked injection of the vessels in the serosa of the small intestines. A hard faecal tumour was found in the colon, which was crushed between the fingers and kneaded toward the rectum. No motion was obtained. The child slept quietly after the operation, but sank in a few hours and died on the 24th. *Post-mortem* examination revealed ulceration in the sigmoid flexure and in the descending colon. The former had led to perforation. The caecum and the ascending and transverse colon were dilated, and the mesenteric glands were enlarged. In discussing the case, Glaserfeld comes to the conclusion that the constipation was congenital. He further points out that neither aperients nor any form of diet appeared to have any influence on the constipation. He therefore believes that the condition must have been due to some physiological change in the wall of the large intestine, which did not produce any corresponding anatomical change.

315. Deglutition Rales.

ISRAEL-ROSENTHAL (*Ugeskrift for Læger*, No. 14, 1909) is of the opinion that sufficient attention has not been drawn to the presence of the so-called "false râles," or râles heard over the apices of the lungs, and which have some extraneous cause. Most textbooks warn students against the "dry râles" that often arise in the shoulder joint, or in its muscles, or those caused by the friction of the scapula against the thorax; but the most frequent cause of an error in diagnosis—the râles caused by the act of swallowing—are scarcely mentioned. The "Schluckgeräusche," of the Germans, first described about fifty years ago, are described by Gerhardt as soft, moist râles heard along the spinal column, and by Guttman and Eichhorst as also heard along the trachea on the left side; but the fact that the sounds caused by the act of swallowing can also be transmitted to the apices of the lungs, appears to be known to but few observers. Turban mentions "oesophagus sounds" as a possible error in diagnosis, but the only author who has described them fully is Petersson in his *Fysikalisk Diagnostik* (Upsala, 1908). According to the author's (the writer of the preseat monograph) experience, one can hear in most people, in connexion with the act of swallowing, sounds simulating râles over the apices of the lungs, although these sounds vary in extent, strength, and character. They are heard, not only above the clavicle, according to Turban, but also below it, down to the second rib; at the back they are heard not

only along the spinal column, but in the suprascapular region and even below the spine of the scapula. They are generally present on both sides, but are loudest on the left side, and are always more pronounced and constant above the clavicle and the spine of the scapula. The sounds are mostly of a moist character, and appear as medium, subpercussant râles with a slight indication of a musical sound caused by their formation in a chamber of resonance. More rarely the sounds are of a "half-dry" character. If there is present infiltration of the apex with bronchial symptoms, these râles acquire a pronounced bronchial character. These sounds may be distinguished from true râles by taking note of the following facts: (1) The deglutition râles are not restricted to the act of respiration, but are present both during inspiration and expiration and during the pauses between them, whereas the real moist râles are principally heard during inspiration, especially at its end, much less during expiration, and not at all during the pauses. (2) The act of swallowing can be easily controlled by placing the finger on the trachea when auscultating. (3) By making the patient hold his breath and swallow during auscultation, one is able to note the resemblance in number and character between the sounds heard after a cough and those caused by the act of deglutition. But it must be noted here that deglutition often becomes more difficult and the sounds caused by it weaker after repeated acts of swallowing. (4) By following with the stethoscope the deglutition sounds from the trachea outwards it is also possible to control the resemblance between the sounds. (5) Intelligent patients can be persuaded to omit the usual act of swallowing after coughing. But it can be absolutely prevented by making the patient hold his mouth open during auscultation. After reviewing the various theories about the genesis of these sounds, the author is inclined to the opinion that they are produced in the pharynx, partly because the sounds are loudest over the trachea, and partly because the pharynx must necessarily be a better chamber of resonance than the oesophagus.

SURGERY.

316. Results of Operative Treatment of Cancer of the Stomach.

PONCET (*Bull. de l'Acad. de Médecine*, No. 12, 1909) publishes a statistical report on the results of operative intervention in 211 cases of cancer and ulcer of the stomach. This report, prepared with the assistance of Delorme and Leriche, deals with cases observed by the author in the course of the last six years. Of 137 cases of gastric cancer regarded as operable, 40 were treated by gastrectomy and 97 by palliative operations, such as gastro-enterostomy, gastrostomy, and jejunostomy. The radical operation of gastrectomy, which the author states was as free as possible, and more or less extensive, resulted in the high operative mortality of 35 per cent. Death in the 14 fatal cases was, it is stated, rarely due to shock, and is attributed to several diverse causes, as, for instance, haemorrhage, peritoneal infection, and acute dilatation of the stomach. It might, the author acknowledges, have been avoided in some few instances by a more rigorous technique and by abstention from operative intervention. In his report on the subsequent fate of the 26 patients who recovered from the immediate results, the author excludes 8, who either were lost sight of, or who, though alive and quite free from recurrence, had not when last seen passed over an interval of more than six months from the date of operation. The remaining 18 patients are ranged under three categories. The first of these, including instances of rapid recurrence or generalization of the disease, shows a death-rate of 40 per cent. in the course of the first twelve months. The data given under the second category show that the proportion of fairly prolonged recoveries is about 34 per cent. Seven patients who lived over the first year died after an average interval of twenty months from the time of the gastrectomy. The frequent occurrence of early relapse after gastrectomy cannot, it is urged, be regarded as a proof of the total failure of this operation in the treatment of cancer. It is, the author holds, the best of the palliative methods, as it favours a complete restoration of health during the free interval. Gastro-enterostomy is also capable of affording

much relief, but this in cases of gastric cancer is a very serious operation, and almost as fatal as gastrectomy. Gastrostomy and jejunostomy are indicated only in extreme cases, and each has the disadvantage of causing a post-operative infirmity. Under the third category are included five instances of patients who when last seen had remained free from recurrence for more than twelve months. The free interval has in one of these cases been three years and a half, and in another as long as five years and ten months.

317. Thrombosis of Inferior Vena Cava.

STILLMAN AND CAREY (*Amer. Journ. of Med. Sciences*, March, 1909) report two cases of thrombosis of the inferior vena cava, the first being acute and possibly a sequel of influenza, and the second being chronic. Case I, a man aged 26, suffered from influenza a fortnight previously, but had felt well for a week. While lifting a heavy weight, he was seized with severe pain in the right side, followed by abdominal tenderness and some ascites. Five days later the abdomen was enormously distended, tense, symmetrical, and tympanitic, with slight tenderness. The legs and external genitalia were very oedematous and cyanosed, but not tender or painful except for the tenderness due to the oedema which had developed gradually since the onset of the illness. The urine contained no albumen. Operation was refused, and the patient died from exhaustion about three weeks later. The inferior vena cava was widely dilated and thrombosed, containing a partially-organized blood clot extending downwards into both common iliac veins and upwards to the groove in the posterior surface of the liver. The walls were much thickened, fused together, and firmly adherent, the lumen being obliterated. The liver was markedly rotated to the right with enlargement of the left lobe, and this occupied almost the position normally occupied by the right lobe. Influenza may have been the primary cause producing a secondary thrombo-phlebitis with extension into the inferior vena cava, or the strain of lifting may have caused the tilting over of the liver to the right, thereby causing a twist of the vena cava and consequent thrombosis. Case II, a man aged 42, complained of swelling and ulceration of the legs. For the past twenty-one years there had been a history of alcoholic excess, with periodic attacks of fever, at first occurring once a year, but later only once in three weeks. The present illness started suddenly in 1893 with severe pain in the left calf, followed by considerable swelling as high as the knee, and two days later the right leg became similarly affected, with swelling of the whole leg. Three weeks later a left pleurisy developed, and after three months ulcers formed on both legs, and these have persisted ever since, occasionally healing at times and then breaking down again, and the veins on the left side of the abdomen became dilated and tortuous, while the attacks of fever became more frequent. It is assumed that at the outset there was a thrombus in the left popliteal and in the right femoral veins, which extended upwards to the lower part of the inferior vena cava, while the pleuritic attack was probably caused by a small portion of clot becoming dislodged, and causing infarction of the lung. Objectively the most important symptoms are oedema of the regions drained by the thrombosed portions of the inferior vena cava, and the establishment of a collateral circulation, while pain and fever are frequently accompanying symptoms, the latter depending rather upon the primary disease than upon the thrombosis.

318. Reflex Scoliosis.

M. DIEULAFAÉ (*Revue d'Orthopédie*, January, 1909) reports a case of sclerosis associated with perinephritic abscess. The patient, a man aged 35, was seen about two and a half months after what was probably the onset of the abscess. There was no great tenderness in the right loin, but a rigidity of muscles and a sense of resistance. The scoliosis was most marked in the lumbar region, with the convexity to the left, and a compensatory curve in the dorsal region. The history of the onset, the general state of emaciation and the facies following, the presence of rigidity of the lumbar muscles on the right side, and the scoliosis, led to the diagnosis of a purulent collection in the region of the kidney. The absence of signs of vertebral affection and of urinary symptoms made a perinephritic situation most probable. The abscess was opened and washed out. Three weeks after operation the scoliosis, which improved day by day, was not to be detected. It is evident that the nature of the lesion determined the form of the scoliosis, but the sensibility of the patient was also an element in the causation, together with the intensity of the inflammation and the mobility of the vertebral column.

OBSTETRICS.

319. Prematernity Practice.

J. W. BALLANTYNE (*Journ. of Obst. and Gyn. of the British Emp.*, February and March, 1909) describes the work done in the prematernity ward of the Edinburgh Royal Maternity and Simpson Memorial Hospital during the autumn quarter of 1908. The number of patients treated was 30; there were 5 cases of eclampsia, 3 of albuminuria without eclampsia, 4 of accidental haemorrhage in pregnancy, 3 of placenta praevia, 4 of threatened abortion, 2 of retroversion of the gravid uterus, 2 of phlebitis in pregnancy, 2 of heart disease (1 of which was complicated by buccal haemorrhage and gingivitis), 1 of gonorrhoeal rheumatism, 1 of marked contraction of the vagina and vulva, 1 of chorea gravidarum, 1 of hydramnios complicated by twins, and 1 case sent in because of the occurrence of fetal death in each of two previous pregnancies. The average age of the patients was somewhat high—namely, 30; 9 of the patients were primiparae, the rest multiparae, 1 being in her seventeenth pregnancy. The result of treatment as far as the mothers were concerned was good; only one died, the patient who suffered from chorea, and she was admitted in an almost hopeless condition only two days before her death. Of the children, 10 out of 25 were stillborn, but only 1 of the 10 had reached the ninth month, 5 being under the seventh month; 6 or 7 were macerated as well as stillborn. The details of the individual cases are given. The 5 cases of eclampsia have several features in common. There was albuminuria and diminution in the amount of urine passed; the pregnancy continued for a time after the onset of convulsions. The treatment consisted in the use of hot packs, of enemata, of acetate of potash mixture, of Henry's solution to act upon the bowels, and of strict milk diet. In all the cases also the mother recovered. Four of the patients were primiparae, 1 was a multipara; the number of convulsions was 5 in one case, 3 in another, 2 in each of two others, and 1 in the fifth; the most serious case was that of the multipara, and she was also the only one with signs of renal disease before the pregnancy. In addition to the treatment described above, in 3 cases a $\frac{1}{2}$ -grain suppository of morphine was given, in 2 cases thyroid extract was used, in 1 of them more than 100 grains altogether of the extract being given, and in 1 case venesection was twice performed, saline solution was transfused, and dry cupping performed. In only 1 case—that of the multipara—was labour induced, and this was the only case in which recovery was doubtful for some days after labour. In 4 cases the fetus was born dead and macerated, and the author inclines to the opinion that the condition which caused eclampsia also caused the fetal death, and that the death of the fetus relieved the renal overstrain and prepared the way for recovery. The 4 cases of accidental haemorrhage were treated by rest in bed, use of enemata, and a morphine suppository ($\frac{1}{2}$ grain). Labour set in in each case a few days after admission; 1 only of the infants survived, 1 died after leaving the hospital, 1 after six hours, and 1 was stillborn. The 3 cases of placenta praevia did well; in 1 of them the os was dilated normally under chloroform; in all of them the fetus was premature and stillborn. In 3 out of the 4 cases of threatened abortion the pregnancy continued. In the case of "habitual" fetal death the patient came in at seven and a half months with a history that fluid had been coming away for three days; labour was induced and a child born in a state of asphyxia pallida; efforts to resuscitate the child were unsuccessful, and it was afterwards found that the thorax could not dilate because of the presence of free fluid in the thorax and abdomen. The author claims that the records given prove that a rapidly increasing demand exists among medical men for some place—either a hospital or nursing home—where cases of morbid pregnancy can be kept under observation and suitably treated, and that there are indications that the patients themselves are beginning to share in this feeling; of the 40 patients, 16 were sent in by medical practitioners outside. The records also prove that many of the most serious cases in obstetric practice occur in the first half of pregnancy. Ballantyne recommends that prematernity cases should be treated in a semi-detached building, rather than in the maternity hospital itself.

320. Pregnancy and Operations for Gall Stones.

ROITH (*Monats. f. Geb. u. Gyn.*, April, 1909) has prepared a monograph including a series of cholecystostomies and cholecystectomies performed on pregnant and puerperal subjects, with general considerations on cholelithiasis in relation to gestation, and the influence of operations on the gall bladder and ducts on pregnancy and the puerperium.

Experience teaches the surgeon and obstetrician that pregnancy is not in itself a contraindication to such operations. Expectant treatment, according to clinical evidence, is not safer than under other conditions. The risk to life when operative measures are undertaken is not greater than under other conditions. The prognosis as to interruption of pregnancy is dependent on the stage of gestation, on the degree of jaundice and infection, and on the extent and duration of the operation. Up to the middle of gestation the risk of abortion is trifling, but it is otherwise later on. On that account cystostomy through a free oblique incision under the ribs is preferable during the later months to more complicated measures, but this rule only applies when the continuance of the pregnancy is important and safe on obstetrical grounds. In the worst cases of the whole class, where the bile symptoms are severe near term, it may be necessary to induce labour before operating on the gall bladder or ducts. Roith advocates vaginal Caesarean section. This measure avoids the perils of labour pains, and the uterine incision will lie far away from the area of operation, which is nearly always infected. When pains set in after operation, it is still advisable to terminate labour artificially at once, as the uterine contractions may promote the dissemination of infection from the operation wounds. Anaesthesia requires great care in all cases of this class.

GYNAECOLOGY.

321. Adrenalin in Caesarean Section.

BOGDANOVIC (*Zentralbl. f. Gynäk.*, No. 19, 1909), in a case of Caesarean section where the wounded uterus contracted badly after extraction of the fetus, acted on the recommendation of Neu, who used adrenalin to bring about contractions. Schäfer had long since pointed out that this compound acted very definitely on the muscular tissue of the non-gravid uterus. Bogdanovic's patient was a primipara, aged 31, with a typical flat, rickety pelvis, and knock-kneed. The child was well developed, and the head presented; the os was beginning to dilate. The mother desired to have a living child and consented to any operation likely to save it. Symphysiotomy and delivery of the child through the rigid soft parts of this elderly primipara seemed dangerous on the child's account. Caesarean section was preferred. A transverse fundal incision was made, the child extracted alive, the membranes removed, and the uterine wound sutured with catgut. The uterine muscle, however, was highly atonic, and free irrigation with warm saline solution failed to set up contractions. Bogdanovic therefore injected into four different points in the uterine wall 1 c.cm. of a 1 in 10,000 fresh solution of Richter's tonogen, a preparation of adrenalin recommended by Neu. The uterus at once contracted till it became of stony hardness, and the haemorrhage from the incision ceased at once. The operation was concluded without any further complications and the puerperium was normal.

322. Foreign Body retained Nine Years in the Uterus.

WINDISCH (*Zentralbl. f. Gynäk.*, No. 19, 1909) reported at a meeting of the Royal Hungarian Medical Association last year that he was consulted by a woman aged 32, many years divorced, on account of uterine haemorrhages and hypogastric pains, which had lasted for nine years. It transpired that she had been under treatment in several hospitals. For six months the bleeding had become very severe, and there was much bearing-down pain in the rectum. The uterus was enlarged and hard, and there was parametric exudation surrounding the rectum as well as the cervix. Rest and the administration of ergot had no effect. There was no rise of temperature. At length Windisch determined to use the curette, and directly it was introduced a little piece of softened wood bent in two was extracted. The patient recovered at once, and, when the foreign body was shown to her, she stated that nine years previously she had pushed it into the uterus to stop haemorrhage. Windisch shortly afterwards came across a similar case. The piece of wood had been slipped into the uterus eight years before the patient consulted him, but he found that it had perforated the posterior wall of the cervix, and projected from the portio, so that it was detected at the first exploration of the vagina, and was extracted with ease. There was purulent exudation, and the patient's after-history could not be traced. Von Kubinyi, in discussing Windisch's case, stated that he once found a piece of wood in a pyosalpinx; it appeared that abortion had been attempted.

THERAPEUTICS.

323. The Treatment of Nervous Bronchial Asthma.

N. VON JÄGIE (*Berl. klin. Woch.*, March 29th, 1909) points out that, although a large number of medicaments have been recommended for the treatment of asthma, none of them are consistently reliable. In America adrenalin is not infrequently employed for this purpose, but this drug is but rarely used in Europe. For the last three years the author has employed adrenalin as a means of cutting short the acute attack, and has found that it acts promptly and well. He discusses the action of adrenalin, and points out that at present we know that the superficial blood vessels are constricted and that the coronary arteries are dilated. Certain vessels, no doubt, are dilated by adrenalin, and it is open to doubt whether the vessels in the lungs are constricted or dilated. It is, however, suggested that a constriction of the pulmonary vessels would have the effect of reducing the swelling of the mucous membranes of the lungs, and inasmuch as the attack of asthma depends on a stimulation of the vagus nerve and a disturbance of the vasomotor secretory function of the mucous membranes, the beneficial action of adrenalin would be explainable if an anaemizing effect takes place. He further suggests that it may act by stimulating the sympathetic as atropin does. He is doubtful whether the adrenalin treatment is of permanent use. The results of animal experiments in producing arterio-sclerosis renders it imperative for the clinician to be cautious in giving adrenalin for a long time. He has, however, given it to one patient, a girl, repeatedly, and when examined two years later, no trace of damage to the vascular system could be detected. He appends some clinical histories, which show the prompt manner in which the attacks terminate in response to subcutaneous injections of 0.5 c.cm. of a 1 in 1,000 solution of adrenalin.

324. Thyresol.

A. HIRSCHBERG considers that it is a considerable advance in therapeutics that the chemical manufacturers have succeeded in freeing sandalwood oil of its irritating effects on the kidneys, stomach, and skin. The Farbenfabrik (vorm. Bayer and Co.) of Elberfeld have introduced a preparation called thyresol, which is stated to be a santalol methyl ether (*Berl. klin. Woch.*, March 22nd, 1909). Various therapeutic reports dealing with the effect of thyresol in gonorrhoea in the male have appeared and have dealt favourably with it. Thyresol is so constituted that no santalol is set free in the organism, so that the usual irritative action of sandalwood oil should not occur. Thyresol is a pale yellow fluid, possessing a weak aromatic odour, is insoluble in water, but is soluble in absolute alcohol, ether, and chloroform. Cats and rabbits tolerate 1 gram well by mouth. Hirschberg has employed it in a large number of female patients in Dr. Nagel's clinic and polyclinic in Berlin. Thyresol is put up in drops, tablets, and capsules. The tablets are made up with carbonate of magnesium, each tablet containing 0.5 gram of thyresol. All the patients took it well, and no signs of irritation of the kidneys, gastro-intestinal tract, or skin followed its use. A few nervous patients complained of eructations, but this he ascribed to hyperacidity of the gastric secretion. The acid acting on the magnesium carbonate produced an excess of gas development. As to the therapeutic effect of thyresol in female gonorrhoea, he points out that the urinary and genital apparatus in the female is separate, unlike in the male. It is therefore theoretically impossible to influence the affections of the genital passages by internal treatment, while those of the urinary passages can be so dealt with. Local treatment had therefore to be employed for the genital affections. Acute and chronic gonorrhoea, with profuse discharge, granular colitis, and urethritis, were beneficially influenced by the medication, and he further found that non-gonorrhoeal cystitis was improved by thyresol. No details of any kind are given by which the reader could judge whether the benefit of the treatment should be ascribed to the internal or to the local treatment.

PATHOLOGY.

325. Brieger's Cachexia Reaction.

THE antifermentative power of human serum has recently been studied from the point of view of utilizing variations in this power for the diagnosis and prognosis of disease. Brieger and Trebing found that the serum of persons suffering from cancer and other diseases in which cachexia is a frequent symptom inhibited the action of trypsin more powerfully than normal serum does. The estimation

of this power was judged by allowing a 1 per cent. solution of trypsin to act on albumen in the form of serum plated out on Petri dishes, and determining how much of the serum of the patient is necessary to stop the formation of a depression or dell due to digestion of the coagulated serum. They found that one loopful of fresh serum mixed with four loopfuls of trypsin solution marked the limit of the power of the normal serum, and expressed this as a positive reaction of 1:4. F. Landois (*Berl. klin. Woch.*, March 8th, 1909), in studying this problem, preferred to use a 1 per cent. trypsin glycerine solution, as he found that unequal suspensions of undissolved trypsin could lead to varying results and also that an aqueous solution does not keep so well as the solution containing glycerine. Another difference between his technique and that of Brieger and Trebing was that he used drops from a pipette instead of loopfuls of solutions. A source of error which he admits lies in the fact that the drop of thickish glycerine solution is probably not of the same size as the drop of more limpid serum. However, this error was constant through all his experiments. He found that the normal dilution, or, as he terms it, index, was between 1:2 and 1:3. Testing the index on cancer patients, he did not obtain a higher antitryptic power than 1:7, while the majority of the patients gave an index of 1:3—that is, practically a normal index. He found, however, that when cachexia was present the index tended to be higher than normal. He found that in a case of hysterical anorexia, with marked loss of weight, the index was normal, which he ascribes to the difference between loss of weight due to hunger and loss of weight due to destruction of leucocytes and proteids. In septic processes the index rises hand in hand with the destruction of leucocytes. He considers that the cause of the increased antitryptic power lies in the destruction of leucocytes and the liberation of leuco ferment. A. Braumstein (*Deut. med. Woch.*, April 1st, 1909) also deals with the same problem. He utilized the same technique as Brieger and Trebing, and obtained the same degree of inhibition of tryptic fermentation. Brieger and Trebing found that in 91.6 per cent. of cancer patients the reaction was positive: von Bergmann and Meyer found that 92.7 per cent. of cancer patients gave positive reactions; and Braumstein found that 91.7 per cent. of cancer patients gave the reaction. Of the non-cancer patients, Brieger and Trebing found a positive reaction in 23.9 per cent., von Bergmann and Meyer in 24.2 per cent., and the author met with it in 27.7 per cent. Taken together with other signs and symptoms, he regards the reaction as a valuable diagnostic means. This contention is supported by cases. The explanation of the reaction given is that the destruction of albumen permits of an absorption of proteolytic ferment and thus to the production of antiferment. He supports this theory by detailing the results of experiments. Rabbits and guinea-pigs were given phloridzin and also phosphorus, both of which are known to lead to the disintegration of proteids. He found that the antiferment power of the serum could be doubled in each case. He compares the reaction to the find of lactic acid in the gastric secretion; far-reaching conclusions cannot be drawn from it with safety. From Brieger's laboratories, F. Brenner (*Deut. med. Woch.*, March 4th, 1909) deals with the reaction in anaemia and details some observations which he made in a series of cases. The haemoglobin content of the blood and the red and white blood cell counts are tabulated and compared with the antitryptic determination. In the 35 cases, the reaction varied from 1:2 up to 1:10. Only two gave normal values (that is, 1:3). In about half the cases the author found a correspondence between the haemoglobin and antitryptin. In the rest of the cases no such correspondence was noted. No parallel was found between the altered number of corpuscles and the altered condition of the antiferment. But the author states that the antitryptic value indicated the severity of the illness. He followed the reaction through the condition during treatment. Twenty of the patients were treated with a natural arsenic water (Max-quelle from Bad Dürkheim), which was given in increasing quantities for thirteen days, and decreasing quantities from the thirty-first day, so that a course extended over forty-two days. Here, again, he believes that the improvement in the haemoglobin content of the blood and of the general condition went *pari passu* with the decrease of the antitryptic power of the serum. He goes as far as to state that the reaction can be utilized as an indication of the improvement of the condition. In the rest of the cases arsenic pills were given, and in these cases he found that both the improvement in the condition and the lessening in the antitryptic power was less rapid and less marked, but just as parallel as in the first series.

326.

Bovine and Human Tubercle Bacilli.

FINGER and JENSEN deal with the wide question of the relation existing between tuberculosis and tubercle bacilli of man and tuberculous and tubercle bacilli of the ox, in a very detailed article in the *Berl. klin. Woch.*, Nos. 42, 43, 44, and 45, 1908. They take into account the work which they have previously carried out and published, and also the publications of other observers. They start with an account of a number of cases of various forms of human tuberculosis and the characteristics of the bacilli found in these cases. They tested the virulence of the bacilli in each case on guinea-pigs, rabbits, and calves, and paid especial attention to the types of pathological changes met with in each case and compared these with the types met with in cases in which the bacilli presented other virulent characteristics. They then proceeded to classify their cases according to the degree of virulence to the various animals, and considered this standpoint in connexion with the possible sources of bacilli. Next the morphology of the bacilli in cultures was studied, and attention was paid to the reaction of the bacilli in glycerine cultures, showing the value of the phenomenon of the alteration of slight acidity to neutrality or weak acidity described by Th. Smith. Having considered these and other points in connexion with the subject, they come to the following conclusions: They do not recognize a sharp differentiation between the type of human and of bovine tubercle bacilli. Bovine bacilli are not always strongly pathogenic to calves, and bacilli which are gained from human sources and for which there appears to be no reason to ascribe a bovine origin may prove much more virulent to calves than the true bovine type. The virulence of bacilli gained from human sources is very variable, and can be high, even in cases in which the type is not characteristic of the bovine origin. They therefore determine that inoculation into rabbits is not a safe method of distinguishing between bovine and human bacilli. They found that no constant differences in the anatomical changes produced by the bovine and human bacilli in man can be found. Even the morphological characteristics of the two types are too little constant to justify conclusions being formed in this connexion. The cultural characteristics are so extremely variable and depend on so many external conditions that it is impossible to distinguish between bovine and human bacilli in this way. With regard to Th. Smith's reaction test, they point out that strains of bacilli are at times met with which correspond in every other respect to the human type, and which behave like bovine bacilli in turning the glycerine bouillon alkaline. It is therefore not permissible to utilize this phenomenon for the distinction between a human and a bovine type. They consider it necessary to investigate the question further in order to determine whether the tubercle bacillus is altered in its characteristics by a sojourn in the human or animal organism, and whether a transition from one to the other type does not at times actually take place. This question is of paramount importance, inasmuch as it may yield an indication as to whether the bacillus of bovine tuberculosis is highly virulent to human beings and vice versa, and whether the change in characteristics is easily induced or not. The subject further has a considerable biological interest. A careful perusal of the original article is strongly recommended to all students of the modern tuberculosis movements, as it in some respects amplifies the work done by others, and thus throws light on a problem which is not yet settled. It is impossible to give all the details in this place.

327.

Properties of Serum in Trypanosomiasis.

MESNIL and BRIMONT (*Ann. de l'Inst. Pasteur*, February, 1909) find that the serum of animals affected with a trypanosomiasis of a subacute or chronic type acquires very quickly special protective properties, and, when mixed with the trypanosomes, prevents the infection of mice. The appearance of these properties and their degree are independent of the progress of the disease; but they rapidly diminish when they survive at all, after a cure has been effected. Up to a certain point this protective power is specific, and may assist in the differentiation of the trypanosomes. It resists heating to from 56° to 64° C. The active substances attach themselves, at least in part, to the body of the trypanosome, which may then be injected with impunity into mice. *In vitro* the active serums do not exert any destructive action on the trypanosomes, even when mouse serum is added as complement. But *in vivo* there is found in the peritoneal cavity of mice which have received serum and virus a rapid and intense phagocytosis of the parasites. Hence it seems that the effect of the serum is to render the trypanosomes susceptible to the leucocytes.

British Medical Association.

PETITION FOR THE GRANT OF A ROYAL CHARTER OF INCORPORATION.

The following is the text of the petition for a Royal Charter for the British Medical Association, which was lodged on Monday, December 21st, 1908:

TO THE KING'S MOST EXCELLENT MAJESTY IN COUNCIL.

THE HUMBLE PETITION of JAMES ALEXANDER MACDONALD, of Taunton in the County of Somerset, Esquire, Doctor of Medicine, and Master of Surgery EDMUND OWEN, of 64 Great Cumberland Place in the County of London, Esquire, Doctor of Laws, and Fellow of the Royal College of Surgeons (England), EDWIN RAYNER, of Stockport in the County of Cheshire, Esquire, Doctor of Medicine, and Fellow of the Royal College of Surgeons (England), ANDREW CLARK, of Uxbridge in the County of Middlesex, Esquire, Doctor of Science,

Fellow of the Royal College of Surgeons (England), The Right Honourable SIR BALTHAZAR WALTER FOSTER, of 30 Grosvenor Road in the City of Westminster, Knight, Doctor of Medicine, Doctor of Laws, Fellow of the Royal College of Physicians (London), Member of Parliament, and one of Your Majesty's Privy Council, SIR VICTOR ALEXANDER HADEN HORSLEY, of 25 Cavendish Square in the County of London, Knight, Doctor of Laws, Fellow of the Royal Society, Fellow of the Royal College of Surgeons (England), ROBERT COCHRANE BUIST, of 166 Nethergate Dundee in Scotland, Esquire, Doctor of Medicine, Member of the Royal College of Physicians (Edinburgh) CHARLES GEORGE DRUMMOND MORIER, of 65 Hamilton Terrace St. John's Wood in the County of London, Esquire, Licentiate of the Royal College of Physicians (Ireland), Licentiate in Midwifery, Licentiate of the Royal College of Surgeons (Ireland), and THOMAS JENNER VERRALL, of Brighton in the County of Sussex, Esquire, Member of the Royal College of Surgeons (England), Licentiate of the Royal College of Physicians (London)

SHewETH as follows:

1. Your Petitioners are respectively the Chairman of Representative Meetings, the Chairman of Council, the Treasurer, the Chairman of the Organisation Committee, two of the Vice-Presidents, the Chairman of the Scottish Committee, the Chairman of the Colonial Committee, and the former Chairman of the Organisation Committee of The British Medical Association (hereinafter called "the Association").

2. The Association is honoured by the direct patronage of Your Majesty, and Your Majesty when Prince of Wales was, and His present Royal Highness the Prince of Wales is, an Honorary Member of the Association.

3. The Association was originally founded at Worcester on the 19th July, 1832, under the name of "The Provincial Medical and Surgical Association," with the objects of the advancement of Medical Science, and the maintenance of the honour of the Medical Profession, by promoting friendly intercourse and free communication amongst its members.

4. The name of the Association was changed in the year 1856 to that of "British Medical Association."

5. On the 17th October, 1874, the Association was duly incorporated and registered with limited liability in pursuance of a licence granted by the Board of Trade under the Companies Act, 1857, Section 23.

6. As the membership increased local Branches and Divisions of the Association were from time to time formed for local areas, the area of each Division being included within the area of a Branch. Members of the Association residing in the area of a particular Division are members of that Division and of the Branch comprising that Division. Every part of the United Kingdom is included in some Division and Branch of the Association.

7. For many years the operations of the Association have extended beyond the limits of the United Kingdom, and Branches and Divisions exist in many of Your Majesty's Dominions beyond the Seas, including (amongst others) India Canada Australia New Zealand and the African and West Indian Colonies.

8. The number of the Members of the Association at the date of its formation in the year 1832 was 50. At the date of its incorporation in the year 1874 the members numbered about 6,000, and the present number of its members is 20,800, of whom about 4,000 are included in Branches outside the United Kingdom, and the remainder are members of Branches in the United Kingdom. The present membership of the Association comprises upwards of 50 per cent. of the total number of practitioners on the Medical Register.

9. Under the present constitution of the Association the general control of its affairs rests with a body known as the Representative Meeting composed of members elected annually by the Divisions. A Central Council, consisting of members elected by the Branches, and of certain members *ex officio* and co-opted members, acts as the Executive of the Association, and carries out the mandates of the Representative Meeting, but with power in certain cases to refer the decisions of that meeting to the votes of all the Divisions of the Association. Considerable latitude is allowed to the Divisions and Branches in the management of their local affairs.

10. The property of the Association consists of—

(a) Freehold land in the City of Westminster, upon which buildings known as No. 429 Strand, Nos. 2, 3, 4, and 5 Agar Street, and Nos. 1 and 2 Harvey's Buildings, formerly stood, but now forming the site of the offices and premises of the Association recently rebuilt at a cost exceeding £40,000.

(b) Various stocks funds and securities and personal chattels and effects.

11. The objects of the Association are declared by its Memorandum of Association to be "the promotion of "medical and the allied sciences, and the maintenance of "the honour and the interests of the medical profession "by the aid of all or any of the following:—

"(a.) Periodical meetings of members of the Association, "and of the medical profession generally, in "different parts of the country.

"(b.) By the publication of such information as may be "thought desirable in the form of a periodical "Journal which shall be the journal of the "Association.

"(c.) By the occasional publication of transactions or "other papers.

"(d.) By the grant of sums of money out of the funds of "the Association for the promotion of the medical "and the allied sciences in such manner as may "from time to time be determined on.

"(e.) And such other lawful things as are incidental or "conducive to the attainment of the above objects."

12. In furtherance of the objects of the Association:—

(a) Annual General Meetings are held at which papers are read and discussions take place upon all branches of medical knowledge. In the years 1897 and 1906 these meetings were held in Canada. They are invariably attended by distinguished members of the medical profession from all parts of the civilized world, and are eminently useful in diffusing information as to the most recent discoveries in medicine and surgery, and the state of knowledge and practice of the profession in different countries. Local meetings with similar objects are organized and held by Divisions and Branches.

(b) Annual grants (usually to the extent of about £1000) are made out of the funds of the Association, by means of scholarships prizes and otherwise, for the encouragement of medical and scientific research.

(c) Committees are appointed for the investigation of the causes and conditions of, and remedies for, particular diseases, and of other subjects of medical interest.

(d) A Journal (known as "The British Medical Journal") has been published weekly ever since the year 1844, and is supplied to every member of the Association. It contains articles dealing with questions affecting medicine, surgery, and the ancillary sciences, reports of the proceedings of various scientific societies (including the Association), reviews of medical literature, and other matter of interest to the medical profession.

(e) Committees are appointed to enquire into and advise upon matters affecting the material interests of members of the medical profession, and their professional relations to one another and to the public. The Association has frequently been instrumental in obtaining the recognition of an accepted standard in various questions of professional conduct.

(f) The Association has from time to time assisted Your Majesty's Government, and the Governments of Your Majesty's Colonies, and Municipal and Local Authorities, in the framing and carrying out of legislation affecting the public health, the poor law, the treatment of lunacy and inebriety, and other matters as to which the members of the medical profession have special knowledge.

(g) The Association has encouraged the establishment of benevolent and provident funds for the benefit of members of the medical profession and their families, but in this respect, and in regard to the protection of individual members against unjust attacks and accusations, the Association has been hampered by the conditions attached to the licence under which it was incorporated.

13. The Association has for many years considered that in the respects last mentioned and in other respects greater freedom of action is desirable in order to enable the Association to undertake more completely than hitherto all proper means for promoting the efficiency and welfare of the medical profession and the advancement of the sciences of medicine and surgery.

14. Your Petitioners humbly submit that, having regard to the antecedents and useful work of the Association, it is appropriate and fitting that it should be honoured by the grant of a Royal Charter of Incorporation, and they firmly believe that it would be greatly for the benefit of the Association that it should be under the protection of Your Majesty's Royal Sanction by means of such Charter, and that the same would greatly tend to promote the objects for which the Association was established and still exists.

15. At the Annual Representative Meeting held at Leicester in the month of July, 1905, the following Recommendation (which had been unanimously adopted by the Central Council) was approved viz.:—"That the Representative Meeting issue the necessary authority for 'application on behalf of the Association to be made' to the Privy Council praying His Majesty to grant a 'Royal Charter of Incorporation.'"

16. In pursuance of the said authority, drafts of the proposed Charter Ordinances and By-laws were prepared and published in the "British Medical Journal," and circulated amongst all the Divisions, both within and without the United Kingdom. The said drafts, and various amendments thereto, were considered by Representative Meetings held in the years 1906, 1907, and 1908.

17. At the Annual Representative Meeting held at Sheffield in the month of July, 1908, it was resolved (with one dissentient only) "that this Representative Meeting approve subject to the amendments adopted 'by the Meeting the draft Charter Ordinances By-laws' and Schedules thereto submitted by the Council and 'that it be an instruction to the Council to take forthwith all necessary steps (1) to carry out in the draft Charter Ordinances By-laws and Schedules the amendments approved by the Meeting and (2) to present 'on behalf of the Association a Petition to His Majesty 'the King to grant to the Association a Royal Charter of Incorporation in the form approved by this Meeting with 'such consequential or formal variations as the Council or 'their legal advisers may find expedient.'"

18. The proposed Charter Ordinances and By-laws submitted with this Petition are those of which the drafts are referred to in the said Resolution, with the amendments in the said Resolution mentioned, and with the addition of such consequential or formal variations only as aforesaid.

19. It is intended that if the proposed Charter be granted all legal and necessary steps shall forthwith be taken for the winding up of the Association as now constituted, and for vesting its property in the Association to be incorporated by the said Charter.

Your Petitioners therefore on behalf of themselves and the other members of the Association most humbly pray Your Most Gracious Majesty to grant a Royal Charter for constituting the members of the Association a Corporation under such regulations and restrictions and with such powers as may to Your Most Gracious Majesty seem meet And Your Petitioners will ever pray &c.

Dated this fifteenth day of December one thousand nine hundred and eight.

The Seal of the British Medical Association is hereunto affixed in the presence of—

	EDMUND OWEN, <i>Chairman of Council.</i>
Seal.	EDWIN RAYNER, <i>Treasurer.</i>
	GUY ELLISTON, <i>General Secretary.</i>
J. A. MACDONALD,	B. WALTER FOSTER,
EDMUND OWEN,	VICTOR HOUSLEY,
EDWIN RAYNER,	R. C. BUIST,
ANDREW CLARK,	C. G. DRUMMOND MORIER,
	T. JENNER VERRILL.

1st To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

LANCASHIRE AND CHESHIRE BRANCH.—Several Divisions have asked the Branch Secretary to assist them in drawing up a clinical and scientific programme for their winter meetings by letting them know of gentlemen who would be willing to read papers or to give demonstrations at meetings of Divisions other than their own. The Honorary Secretary would accordingly be pleased to know of any members willing to give such papers or demonstrations, so that he may be able to submit them to the Divisions.—F. CHARLES LARKIN, Branch Secretary, Liverpool.

METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.—There will be a meeting of the Kensington Division, at the Kensington Town Hall, on Thursday, January 21st, at 5 p.m., when Mr. L. A. Bitwell will give an address on the immediate and ultimate results of gastro-enterostomy for gastric and duodenal ulcer.—H. BECKETT OVERY, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER DIVISION.—The next meeting of the Westminster Division will be held at the Florence Restaurant, Rupert Street, on Thursday, January 7th, 1909, when Dr. Savage has kindly promised to read a paper on the future care of the insane. The meeting will be preceded by a dinner at 7.30, at which members of any other Divisions of the Association will be welcome if they will kindly notify J. Howell Evans, Esq., F.R.C.S., 25, Berkeley Square.—HARVEY HILLIARD, Honorary Secretary.

THE SEVENTY-SEVENTH ANNUAL MEETING

OF THE

BRITISH MEDICAL ASSOCIATION,

BELFAST,

JULY 23RD TO JULY 31ST, 1909.

President :

SIMON SNELL, Hon.D.Sc., F.R.C.S.Edin., Ophthalmic Surgeon, Royal Infirmary, Sheffield.

President-elect :

Sir WILLIAM WHITLA, M.D., LL.D., Professor of Materia Medica and Therapeutics, Queen's College, Belfast.

Past-President :

HENRY DAVY, Hon.D.Sc., M.D., F.R.C.P.Lond., Physician, Royal Devon and Exeter Hospital, Exeter.

Chairman of Representative Meetings :

JAMES ALEXANDER MACDONALD, M.D., M.Ch., R.U.L., Physician, Taunton and Somerset Hospital.

Chairman of Council :

EDMUND OWEN, Hon.D.Sc., LL.D., F.R.C.S., Consulting Surgeon to St. Mary's Hospital, London.

Treasurer :

EDWIN RAYNER, M.D.Lond., F.R.C.S., Surgeon, Stockport Infirmary, Stockport.

The Seventy-seventh Annual Meeting of the British Medical Association will be held in Belfast in July, 1909. The President's address will be delivered on Tuesday, July 27th, and the Sections will meet on the three following days. The Annual Representative Meeting will begin on Friday, July 23rd, 1909.

PROGRAMME OF BUSINESS.

The Address in Medicine will be delivered by FREDERICK TAYLOR, M.D., F.R.C.P., Consulting Physician, Guy's Hospital.

Professor KOCHER has been invited to deliver the Address in Surgery.

The Address in Obstetrics will be delivered by Sir JOHN W. BYERS, M.D., Professor of Midwifery and Diseases of Women, Queen's College, Belfast.

The Popular Lecture will be delivered by Dr. J. A. MACDONALD, Physician to the Taunton and Somerset Hospital, Chairman of the Representative Meetings.

THE SECTIONS.

The scientific business of the meeting will be conducted in fifteen Sections, which will meet on Wednesday, July 28th, Thursday, July 29th, and Friday, July 30th.

The President, Vice-Presidents, and Honorary Secretaries of each Section constitute a Committee of Reference for that Section, and exercise the power of inviting, accepting, or declining any paper, and of arranging the order in which accepted papers shall be read. Communications with respect to papers should be addressed to one of the Honorary Secretaries.

A paper read in the Section must not exceed fifteen minutes, and no subsequent speech must exceed ten minutes.

Papers read are the property of the British Medical Association, and cannot be published elsewhere than in the BRITISH MEDICAL JOURNAL without special permission.

The following are the general arrangements so far as they are yet complete :

ANATOMY AND PHYSIOLOGY.

President : CHARLES SCOTT SHERRINGTON, M.D., F.R.S., Physiological Laboratory, University, Liverpool.

Vice-Presidents : Professor THOMAS HUGH MILROY, M.D., F.R.S.E., Queen's College, Belfast; Professor PETER

THOMPSON, M.D., King's College, Strand, London; ARTHUR PHILIP BEDDARD, M.D., F.R.C.P., 44, Seymour Street, Portman Square, London, W.

Honorary Secretaries : ALEX. LOW, M.B., 142, Blenheim Place, Aberdeen; JOHN ALEX. MILROY, M.D., Queen's College, Belfast.

DERMATOLOGY AND ELECTRO-THERAPEUTICS.

President : WILLIAM CALWELL, M.D., 6, College Gardens, Belfast.

Vice-Presidents : ROBERT BRIGGS WILD, M.D., 95, Mosley Street, Manchester; LESLIE ROBERTS, M.D., 46, Rodney Street, Liverpool.

Honorary Secretaries : JAMES HARRY SEQUEIRA, M.D., F.R.C.P., 8A, Manchester Square, London; S. ERNEST DORE, M.D., 26, New Cavendish Street, London; JOHN CAMPBELL RANKIN, M.D., 38, University Road, Belfast.

EDUCATION

DISEASES OF CHILDREN.

President : HAROLD J. STILES, F.R.C.S.Edin., 9, Great Stuart Street, Edinburgh.

Vice-Presidents : JOHN McCaw, M.D., 74, Dublin Road, Belfast; RICHARD WHYTOCK LESLIE, M.D., "St. Heliers,"

Strandtown, Belfast; ROBERT CAMPBELL, F.R.C.S., 21, Great Victoria Street, Belfast.

Honorary Secretaries: ANDREW FULLERTON, F.R.C.S.I., 8 University Square, Belfast; JOHN WILLIAM SIMPSON, M.D., 19, Lansdowne Crescent, Edinburgh.

HAEMATOLOGY AND VACCINE THERAPY.

President: SIR ALMROTH WRIGHT, M.D., F.R.S., 6, Park Crescent, Regent's Park, London, N.W.

Vice-Presidents: ALEX. GARDNER ROBE, M.B., 15, University Square, Belfast; THOMAS HOUSTON, M.D., 95, Great Victoria Street, Belfast; Captain STEWART RANKIN DOUGLAS, I.M.S., Inoculation Department, St. Mary's Hospital, London.

Honorary Secretaries: WILLIAM DUNLOP DONNAN, M.D., 12, High Street, Holywood, co. Down; DUDLEY W. CARMALT-JONES, M.B., B.Ch.Oxon., 78, Wimpole Street, London, W.

INDUSTRIAL DISEASES AND PUBLIC HEALTH.

President: LOUIS COLTMAN PARKES, M.D., 61, Cadogan Square, Chelsea, London.

Vice-Presidents: SAMUEL AGNEW, M.D., Lurgan, co. Armagh; HENRY O'NEILL, M.D., 6, College Square East, Belfast; CHARLES KILICK MILLARD, M.D., Town Hall, Leicester.

Honorary Secretaries: CHARLES PORTER, M.D., Public Health Department, Town Hall, Finsbury; WILLIAM MCLEORINAN, L.R.C.P., 103, Antrim Road, Belfast; THOMAS CARNWATH, M.B., Town Hall, Manchester.

LARYNGOLOGY, OTOTOLOGY, AND RHINOLOGY.

President: ST. CLAIR THOMSON, M.D., F.R.C.P., 28, Queen Anne Street, London.

Vice-Presidents: ERNEST BLECHYNDEN WAGGETT, M.B., 45, Upper Brook Street, London, W.; V. P. HENRY SMURTHWAITE, M.D., 8, St. Mary's Place, Newcastle-on-Tyne; J. A. KNOWLES RENSCHAW, M.D., 11, St. John Street Manchester.

Honorary Secretaries: HAROLD SHUTTLEWORTH BARWELL, F.R.C.S., 55, Wimpole Street, London; JOHN STODDART BARR, M.B., 13, Woodside Place, Glasgow; HENRY HANNA, M.B., B.Sc., 57, University Road, Belfast.

MEDICINE.

President: PROFESSOR JAMES ALEXANDER LINDSAY, M.D., F.R.C.P., 3, Queen's Elms, Belfast.

Vice-Presidents: ARTHUR FOXWELL, M.D., F.R.C.P., 47, Newhall Street, Birmingham; JOSEPH FRANCIS O'CARROLL, M.D., F.R.C.P.I., 43, Merrion Square, Dublin; LAURISTON ELGIE SHAW, M.D., F.R.C.P., 64, Harley Street, London; WILLIAM BAIRD MCQUITT, M.D., 8, College Square East, Belfast.

Honorary Secretaries: JOHN SMYTH MORROW, M.D., Elia House, Antrim Road, Belfast; LEWIS ALBERT SMITH, M.D., 25, Queen Anne Street, London, W.; JOHN ELDER MACILWAIN, M.D., 55, University Road, Belfast.

NAVY, ARMY, AND AMBULANCE.

President: Fleet Surgeon J. LLOYD THOMAS, R.N.

Vice-Presidents: Inspector-General ROBERT BENTHAM, R.N. (retired), 22, King's Avenue, Ealing, London, W.; Lieut.-Colonel R. PORTER, R.A.M.C., P.M.O., Station Hospital, Military Barracks, Belfast; Colonel THOMAS H. HENDLEY, I.M.S., C.I.E., 4, London Road, London, N.W.

Honorary Secretaries: Captain M. LOWSLEY, R.A.M.C., St. Michael's Road, Aldershot; Captain HERBERT HUGH BLAIR CUNNINGHAM, M.D., F.R.C.S., 69, University Road, Belfast; Surgeon EDMUND COX, M.B., R.N., The Royal Hospital, Chatham.

OBSTETRICS AND GYNAECOLOGY.

President: JOHN CAMPBELL, M.D., Crescent House, University Road, Belfast.

Vice-Presidents: ROBERT ALEXANDER GIBBONS, M.D., 29, Cadogan Place, London; JOHN SINGLETON DARLING, M.B., High Street, Lurgan; CHARLES EDWIN PURSLOW, M.D., 192, Broad Street, Birmingham; EWEN JOHN MACLEAN, M.D., 12, Park Place, Cardiff.

Honorary Secretaries: HENRY THOMAS HICKS, F.R.C.S., Derby; ROBERT JAMES JOHNSTONE, M.B., F.R.C.S., 14, University Square, Belfast.

OPHTHALMOLOGY.

President: JOHN WALTON BROWNE, M.D., 10, College Square North, Belfast.

Vice-Presidents: ARTHUR W. SANDFORD, M.D., 13, St. Patrick's Place, Cork; WILLIAM MARCUS KILLEN, M.D., 9, Clifton Street, Belfast; ALEX. HILL GRIFFITH, M.D., 17, St. John Street, Manchester.

Honorary Secretaries: JAMES ANDREW CRAIG, F.R.C.S., 11, University Square, Belfast; LESLIE JOHNSTON PATON, F.R.C.S., 1, Spanish Place, Manchester Square, London.

PATHOLOGY.

President: PROFESSOR WM. ST. CLAIR SYMMERS, M.B., Queen's College, Belfast.

Vice-Presidents: WALTER SYDNEY LAZARUS-BARLOW, M.D., Cancer Research Laboratory, Middlesex Hospital, London; ARTHUR EDWARD MOORE, M.B., Castlemahon, Blackrock, Cork; ASTLEY VAYASOUR CLARKE, M.D., 37, London Road, Leicester; PROFESSOR I. WALKER HALL, M.D., 9, Royal Park, Clifton, Bristol.

Honorary Secretaries: ALFRED EDWARD BARNES, M.B., 348, Glossop Road, Sheffield; OTTO F. F. GRÜNBAUM, M.D., 34, Wimpole Street, London, W.; WILLIAM JAMES WILSON, M.D., Pathological Laboratory, Queen's College, Belfast.

PHARMACOLOGY AND THERAPEUTICS.

President: PROFESSOR RALPH STOCKMAN, M.D., F.R.S. Edin., The University, Glasgow.

Vice-Presidents: PROFESSOR WALTER ERNEST DIXON, M.D., Pharmacological Laboratory, Cambridge; NEWMAN NEILD, M.D., 9, Richmond Hill, Clifton, Bristol.

Honorary Secretaries: VICTOR GEORGE LEOPOLD FIELDEN, M.B., 84, Dublin Road, Belfast; HECTOR CHARLES CAMERON, M.B., Guy's Hospital, London, S.E.

PSYCHOLOGICAL MEDICINE.

President: OUTTERSON WOOD, M.D., 40, Margaret Street, Cavendish Square, London.

Vice-Presidents: GEORGE ROBERT LAWLESS, F.R.C.S.I., District Asylum, Armagh; WM. RICHARD DAWSON, M.D., 41, Upper Fitzwilliam Street, Dublin; ROBERT HENRY COLE, M.D., 25, Upper Berkeley Street, London, W.; MICHAEL JAMES NOLAN, L.R.C.P. and S.I., Down District Asylum, Downpatrick.

Honorary Secretaries: WALTER SAMUEL SMYTH, M.B., District Asylum, Antrim; SIDNEY HERBERT CLARKE, M.B., Leicester and Rutland Asylum, Narborough, Leicestershire.

SURGERY.

President: PROFESSOR THOMAS SINCLAIR, M.D., F.R.C.S., 22, University Square, Belfast.

Vice-Presidents: CHARLES ALFRED BALLANCE, M.V.O., M.S., F.R.C.S., 106, Harley Street, W.; SIR PETER O'CONNELL, M.D., 9, College Square North, Belfast; ARTHUR JOHN DREW, F.R.C.S., Water Hall, St. Aldate's, Oxford; JOHN GALWAY COOKE, M.B., City and County Infirmary, Londonderry; ARTHUR BROWNLOW MITCHELL, F.R.C.S.I., 18, University Square, Belfast.

Honorary Secretaries: W. THRELWALL THOMAS, F.R.C.S., 84, Rodney Street, Liverpool; G. LENTHAL CHEATLE, C.B., F.R.C.S., 117, Harley Street, London; HOWARD STEVENSON, M.B., F.R.C.S.I., 2, College Square North, Belfast; JAS. BERNARD MOORE, M.B., 11, Clifton Street, Belfast.

TROPICAL MEDICINE.

President: CHARLES WILBERFORCE DANIELS, M.B., London School of Tropical Medicine, Albert Docks, London.

Vice-Presidents: Lieutenant-Colonel ANDREW DEANE, I.M.S., Royal Victoria Hospital, Belfast; Surgeon-General W. R. BROWNE, M.D., C.I.E., 5, Royal Crescent, Holland Park Avenue, London.

Honorary Secretaries: JAMES COLVILLE, M.D., 7, University Square, Belfast; Dr. ANTON BREINL, Director Runcorn Research Laboratories.

PROVISIONAL TIME TABLE.

FRIDAY, JULY 23RD, 1909.

11 A.M.—Annual General Meeting followed by Representative Meeting.

SATURDAY, JULY 24TH, 1909.

9.30 A.M.—Representative Meeting.

2, College Square North, Belfast.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

EDINBURGH BRANCH:

SOUTHERN DIVISION.

A MEETING of the Division was held in the Oddfellows' Hall on December 18th, 1908, at 8.15 p.m. Dr. MATHESON was in the chair, and there were present Drs. Allen, Cullen, Dickson, Porter, E. Price, G. Price, Proudfoot, Jamieson, Kennedy, Steven, Walker, and the Secretary. Dr. Keppie Paterson, Secretary of the North-East Division, was also present as a visitor.

Confirmation of Minutes.—The minutes were read, approved, and signed.

Apologies for Non-attendance.—Apologies for absence were received from Drs. Brock, Mackenzie, and Webster.

The Divisions and the General Practitioner.—The resolution:

That the British Medical Association, through its Divisions, does not meet the local requirements of the general practitioner,

which was remitted by the Branch Council to the Edinburgh Divisions for consideration and suggestion, was

again submitted. The CHAIRMAN reviewed some of the reasons which led to the resolution, and proposed several remedies which might be adopted by the Branch Council and the Divisions. After some discussion, taken part in by Drs. PROUDFOOT, WALKER, PORTER, JAMIESON, K. PATERSON, and DEWAR, the Secretary was instructed to report to the Secretary of the Branch Council.

Medical Men and Street Casualties.—The relation of medical men to street casualties was then considered, and it was resolved to remit the matter to the Branch Council, with the view of learning the opinions of the profession in Edinburgh and Leith on the subject.

Paper.—Dr. DEWAR read a short paper on the value of alcohol as a medicine in disease. An interesting discussion followed, which was contributed by Drs. WALKER, PROUDFOOT, STEVEN, DICKSON, CULLEN, KEPPIE PATERSON, JAMIESON, KENNEDY, and E. PRICE. Dr. DEWAR replied.

Subject of Discussion at Next Meeting.—The medical subject chosen for discussion at the next meeting was the early diagnosis and treatment of appendicitis, to be opened by Dr. Kennedy.

Vote of Thanks.—A vote of thanks to the Chairman closed the meeting.

LANCASHIRE AND CHESHIRE BRANCH:

ASHTON-UNDER-LYNE AND DISTRICT DIVISION.

A MEETING of this Division was held at the Ashton-under-Lyne Infirmary on Thursday, December 17th, 1908. There were twenty members present.

Demonstrations.—Dr. MAMOURIAN demonstrated a great number of interesting cases, chiefly post-operative, in the out-patient department.

Visit to Wards.—An adjournment was made to the wards, where further instructive clinical material was shown, giving the members a good idea of the work being done at this progressive and up-to-date institution.

Tea.—A highly successful meeting terminated by the members partaking of afternoon tea, kindly provided by the governors.

ST. HELENS DIVISION.

A MEETING of the St. Helens Division was held on December 4th, 1908, in the Fleece Hotel, St. Helens. There were present Drs. Reid, Bassett, Challanor, Dowling, Fox, Graham, Kerr, Merrick, Wilson, and Buchan. It was resolved that Dr. REID take the chair.

Apology for Non-Attendance.—A letter of apology for absence, from Dr. Mouncey, was read.

Confirmation of Minutes.—The minutes of the meeting of November 4th were read and adopted.

Medical Aid Societies.—The SECRETARY reported as to the action taken in accordance with the resolution regarding the Modern Sickness and Accident Assurance Association, Liverpool, and read a communication from one of the members of the Division on the subject. The Secretary was instructed to communicate with the member thanking him for his letter, and expressing the hope that on an early date he would resign his appointment in connexion with this medical aid society.

Medical Inspection of School Children.—A communication was read from the Branch Secretary regarding the remuneration of officers appointed to do this work. The Division agreed with the general terms of the communication, and requested the Chairman to forward to the Town Council the expression of opinion of the Division that medical practitioners appointed to carry out duties in connexion with the medical inspection of school children who devoted the whole of their time to the public service should be paid at a salary of not less than £250 per annum.

Election to Central Council.—A letter was read from Dr. Garstang, one of the Representatives of the Branch on the Central Council, and the Secretary was instructed to write Dr. Garstang, informing him that the Division would be pleased if he would attend a future meeting of the Division to inform them as to the work of the Central Council.

Election of Members.—The names of gentlemen proposing to join the Association were submitted, and instructions were given to the Representative on the Branch Council thereon.

The Division and the St. Helens Medical Society.—The report of the joint meeting of the Executive of this

Division with the committee of the local society was submitted and approved.

Unity of Oddfellows.—Dr. GRAMM brought up the question of meeting medical referees in connexion with sickness among members of this Order, and it was resolved to bring under the notice of the secretaries of the different branches of the Order the necessity of their conforming with the ordinary rules of medical etiquette when requiring further reports regarding their sick members.

Ethical Rules.—It was remitted to the Executive Committee of the Division, with the addition of Dr. Challenger, to draft a set of ethical rules and submit them to the next meeting of the Division.

METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.

A MEETING of this Division was held on December 9th, 1908, at the Kensington Town Hall, and after a lengthy discussion was adjourned till Friday, December 18th, 1908. On the first occasion there were 42 members present and on the second 36.

Confirmation of Minutes.—The minutes of the previous general meeting were read and confirmed.

Chairman.—In the absence of Dr. Rice Oxley on account of ill-health, the VICE-CHAIRMAN (Sir Charles Cuffe, K.C.B.), took the chair, and when he was obliged to leave Dr. CRAWFORD THOMSON was asked to take his place.

Medical Inspection of School Children and School Clinics.—A letter was read from Mr. Smith Whitaker, the Medical Secretary, asking the Division to discuss the question of the treatment of school children found on inspection to be suffering from defects and diseases needing treatment. Dr. JAMES KERR, the Medical Officer (Education) of the London County Council, who had kindly accepted an invitation to address the Division, then spoke. He referred to the pressing necessity of the matter, and the experience of towns in the provinces and Continental countries. It was most important for the community that these children who were suffering from remediable affections should be treated, and not allowed to become defective and therefore unemployable. Having indicated the lines on which it was proposed the treatment should be carried out he emphasized the point that the work to be done was work which had hitherto not been done, and therefore would not hurt any practitioner. Dr. H. H. MILLS and Dr. ETHEL BENTHAM spoke in favour of the establishment of school clinics. Dr. ATKINSON and Mr. JOSEPH SMITH opposed them. Mr. STURGE argued strongly in favour of the work being done by the provident dispensaries, which would need to be reorganized, and the necessary men appointed to do the special work. These would have to be paid properly. The MEDICAL SECRETARY then stated the view of the Medico-Political Committee, which would be issued in the form of a report very shortly. He pointed out that the matter must not be discussed from the ratepayers or tax-payers' point of view, but from the standpoint of public interest as regards the physique and health of the nation, and as it concerns the honour and interests of the profession. The Medico-Political Committee strongly condemns the paying of subsidies to voluntary and charitable institutions by the local authorities in return for special facilities for the treatment of the children. The HONORARY SECRETARY moved the following resolution:

That the Kensington Division of the British Medical Association approves of the formation of school clinics for the treatment of the defects and diseases of school children enumerated in the recommendations of the Special Subcommittee of the Education Committee.

He drew attention to the fact that these diseases and defects were strictly limited to four groups: Teeth defects and simple diseases of the teeth; eye defects and simple diseases of the eyes; skin diseases, chiefly parasitic; ear defects and simple diseases of the ears. Dr. H. H. MILLS seconded this resolution. Dr. H. STURGE moved as an amendment:

That the words "formation of school clinics" be deleted, and the words "reorganization of the provident dispensaries" be inserted, and to add the words "children of parents who can afford to pay a private practitioner to be excluded."

This was seconded by Dr. ATKINSON, and opposed by Dr. ETHEL BENTHAM and Dr. MOORHEAD.

At the adjourned meeting on December 18th the discussion on the amendment was continued, Dr. H. H.

MILLS, Mr. HERBERT TANNER, Dr. SHREVSALL, Dr. KISCH, Dr. BENJAMIN JONES, Dr. CRICHTON, Dr. JAFFE, Dr. E. M. BLUETT, and Dr. VERE NICOL taking part in it. The amendment was rejected by 22 votes to 10. Dr. KISCH then moved that the words:

Such clinics to be in connexion with the Poor Law,

should be added to the resolution. Dr. CLIFFORD seconded, and after a short discussion this was rejected by 17 votes to 5; and the original resolution was carried by 21 votes to 7.

The Referendum and the Charter.—Dr. CRAWFORD THOMSON having explained the situation caused by the threatened action of the South-Western and other Branches to oppose the Charter as regards the Referendum, Dr. EASTES moved the following resolution:

That this Division approves of the two alterations in the taking of the Referendum proposed by the South-Western Branch of the British Medical Association, and especially expresses its gratification that the principle of the postal Referendum which this Division brought forward unsupported in 1906 has now obtained wide appreciation amongst members of the Association. It nevertheless considers the present time, when application is about to be made to the Privy Council for the grant of a Royal Charter, inopportune for an endeavour to introduce the said changes into the draft Charter.

This was seconded by Dr. BUTTAR, and supported by Sir CHARLES CUFFE, Mr. HERBERT TANNER, Dr. CRICHTON, and passed *nem. con.*

STRATFORD DIVISION.

A MEETING of this Division was held at the Alexandra Hotel, Stratford, E., on Thursday, December 17th, 1908, Dr. BERNACKI in the chair.

Address.—Dr. ROBERT MILNE gave an address on the treatment of scarlet fever by the application of eucalyptus oil to the skin. The lecture greatly interested the members present, and was followed by a keen discussion. After answering various questions as to the details of the treatment Dr. Milne received a cordial vote of thanks.

Annual Representative Meeting.—Dr. PERCY ROSE presented his report of the Annual Representative Meeting held at Sheffield. His account of the proceedings was greatly appreciated, and Dr. Rose was accorded a hearty vote of thanks for his interesting report and for the enthusiasm he has shown as Representative of the Stratford Division.

ULSTER BRANCH:

BELFAST DIVISION.

A MEETING of the Division was held on Wednesday, December 16th, 1908. The Chairman, Dr. W. G. MACKENZIE, presided.

Chairman's Introductory Address.—The CHAIRMAN delivered his introductory address, entitled "A Retrospect of Thirty Years of the Medical Life of Belfast." He contrasted the operative methods of his student days with the present, and mentioned the excitement of the board of management of a children's hospital when it became known that he intended to open up the inside of a little child. Many stories and incidents of the old times were related in a most entertaining manner and followed by the members with great interest. On the motion of Dr. ST. GEORGE, seconded by Dr. CECIL SHAW, a hearty vote of thanks was accorded to the Chairman.

A Typhoid Carrier.—Drs. S. T. IRWIN and T. HOUSTON then read a paper on a typhoid carrier. Dr. Irwin described the clinical histories which led him to suspect the patient, a servant, of being the cause of several cases of typhoid occurring in one house. Dr. Houston described his finding that this patient gave a positive Widal reaction, and later that her urine, taken aseptically by catheter, contained abundant typical typhoid bacilli. Urinary antiseptics having failed to rid the urine of bacilli a vaccine was prepared and the patient inoculated according to Wright's methods, with subsequent complete disappearance of the bacilli. The patient's urine tested periodically since had not shown any return of the microbes. Drs. CALWELL, ROBE, Captain ARCHER, Drs. McKISACK, FULLERTON, FRASER, and the CHAIRMAN discussed the case. Dr. HOUSTON replied.

The Chairman, at the conclusion of the meeting generously provided coffee and cigars for those present.

PERTSHIRE BRANCH.

A GENERAL meeting of this Branch was held in the Station Hotel, Perth, at 3.30 p.m. on Friday, December 4th, 1908; Dr. D. H. STIRLING was in the chair, and there were present Drs. Haig, McEwan, Burnett, J. Hume, Trotter, Urquhart, Bruce, C. P. Stewart, Moffett, McLeish, Lyell, R. Stirling, M. Hume, and Taylor.

Apology for Non-attendance.—An apology for non-attendance was intimated from Dr. Paton.

Confirmation of Minutes.—The minutes of previous meetings were read, approved, and signed by the PRESIDENT.

Report of Council.—The report of Council was presented. It stated that during the last year five meetings of the Branch was held—two ordinary, one clinical, and two special—and five meetings of Council. The number of members of the Branch continued much the same, though many changes had taken place during the year.

Annual Representative Meeting.—Dr. TROTTER acted as substitute for Dr. D. H. Stirling, who was unable to attend the Annual Representative Meeting. Dr. Trotter referred first to the most important subject brought up for discussion—for example, the new Charter—which would probably be granted in a few months' time. Next he mentioned how the Council were taking up the matter of finance, and trying to make it sound. Among other things he mentioned sight testing, herbalists' charters, medical and other insurance with the Guardian Insurance Company. A vote of thanks was unanimously accorded.

Treasurer's Report.—The following report was presented by the TREASURER:—

RECEIPTS:	£	s.	d.	£	s.	d.
To balance from 1907	0	3	3
Received from London	10	19	9
Interest on dep. receipts	0	13	4
				11	16	4
Taken from dep. receipts	3	0	0
				14	16	4
EXPENDITURE:						
Printing, typing, stationery and						
Secretarial expenses	6	18	6
Expense of rooms	0	10	0
Travelling expenses of Council	4	7	11
Lynn Thomas and Skyrme Fund	2	2	0
				13	18	5
				0	17	11

This leaves 17s. 11d. balance in bank and £31 on deposit receipt. The Treasurer was thanked for his trouble and care of the finances.

New Branch Rules.—On the motion of Dr. URQUHART, the Secretaries along with the Treasurer were appointed to draw up new Branch rules and lay them before the Branch. This was agreed to.

President's Address.—Dr. D. H. STIRLING then delivered his Presidential address. He took for his subject A Retrospect and a Forecast. The contrast between fifty-five years ago and now was shown as starting from the standpoint of preliminary education as required then and what it was to-day. The old and famous teachers in the University of Edinburgh were pictured as they lived, taught, and fought, and set an example of devotion to work before the youth of that day. A description was given of pre-Lister times when major operations were so often attended with such sad results. The President had lived through all these, and later times, and spoke from personal experience of the almost inconceivable contrast between "then and now." His personal acquaintance with the leaders in medicine and surgery from the middle of last century on, enabled him to impart living reality to the life and work of a generation now almost extinct. In every department of medicine and surgery, except therapeutics, progress was reported, and full expectation of a grand future expressed. Of therapeutics he had much to say. The great authorities of the past "seem to have been of every variety of thought and action," and the fact of such diversity had evidently produced quite different effects on the men who passed out then into active professional life. "The forces at work in our ranks tend to carry forward all that is sound in principle handed down by our fathers, to correct errors, and to discover new truths." The worst enemy he saw around and before them in therapeutics was in the ever-increasing energy of pharmaceutical chemists in the

manufacture of new drugs. Synthetic chemistry threatened to ruin any safe and scientific use of active drugs. These were thrust upon the profession under fanciful names, registered as proprietary products, with accompanying testimonials from men mostly unknown in this country. The drugs, for the most part, had a short life—many of the first lots had disappeared or receded into the background. The danger was great to the profession and to the public—to the profession because the drugs were not proved; to the public because the registered trade names of many are made known to the community in widely-distributed advertisements, along with the diseased states in which they were to be employed. What might be called a drug mania had taken possession of the people. "Wonderful chemistry, commercial success; fatal to the progress of the science of therapeutics. Chlorodyne, sulphonal, cocaine, antipyrin, heroin, and a host of others are sold by retail druggists in every part of the country without medical advice—poisons all." The President asked this question: Why should every active drug employed by physicians not be prepared under strict scientific guidance and sold in a form that can be prescribed by medical men, singly or combined, as was always done before tabloids and tablets came into use? There would be far fewer unpronounceable names, synonyms, and fancy trade designations in the *Pharmacopœia* and the *Extra Pharmacopœia*, but much more correct acquaintance with those that have been subjected to careful tests, first, as to physiological action, and, secondly, as to their action in medical practice. As things are, we are drifting into chaotic confusion, soon to be a laughing stock to the self-instructed distributors of drugs among their friends. Bacteriology holds the field: its triumphs are known to us all. The causes of many diseases have been traced to living organisms, as was long ago suspected, and now proved. To the many able workers in that field science and medicine were deeply indebted. Goats, rats, even fleas and flies, were found carriers of deadly poisons, and typhoid carriers among their own friends had been proved culprits. The future of that almost new science was full of hope. Public hygiene in 1853 was a poor, sickly plant; it was now a wide spreading tree, a very healer of the nations. In closing, the President referred to the presence of Dr. Bruce, of Murthly Asylum, who was a scientist and who had done much good work in his field of medicine.

Vote of Thanks to President.—Dr. URQUHART, in proposing a vote of thanks to the President for his interesting and reminiscent address of days gone by, mentioned specially Sir William Gairdner and his methods, and Dr. Paul of Elgin and his simple senna tea and their very few drugs. He wondered how they could stem the current of this flood of new drugs. Dr. BURNETT in a few words seconded. In his reply to the vote of thanks, the PRESIDENT said unless something was done to check the multifarious number of drugs and quack medicines now being produced, serious injury and danger to the public at large would undoubtedly result.

Patent Medicines.—Dr. URQUHART read a note on patent medicines, etc., and moved that the following points be submitted to the Branch Council for consideration and report:

1. That the trade in secret remedies and patent medicines is an evil to the public, a danger to life, and a wrong to the medical profession.
2. That the Government stamp gives a false sense of security to the buyer.
3. That there is a fatal facility in the sale of powerful drugs which should be safeguarded in the public interest.
4. That there is a vast trade in such poisons as sulphonal, acetanilide, etc., which should be restricted.
5. That these remedies should be officially tested, priced, and the results published for the information of doctors and druggists.
6. That every such article sold should have on the cover the exact composition and method of manufacture of the enclosure.
7. That the contents should be guaranteed to consist of the ingredients named in the quantities stated.
8. That any infringement of this guarantee should be made an offence, and that prosecution of offenders should be at the instance and cost of the public authority.
9. That all drugs of a nature dangerous to life should be scheduled as poisonous, and the cover should clearly state that the contents are poisons.
10. That legal restrictions should be placed upon the sale of dangerous drugs, except to the person named upon the medical prescription authorizing the sale.

11. That each medical prescription should be limited by the prescriber to the duration of time named upon the prescription, and that it be made an offence to infringe this limitation.

12. That all prescriptions should be written in chemical language, omitting the patented name of drugs.

13. That these suggestions be submitted to the Branch Council for consideration and report.

In his remarks Dr. Urquhart said he was pleased that the President had referred to this very important matter in his address, and hoped much good would come of it. The Branch thanked Dr. Urquhart for the manner in which he had brought this subject, of great concern to all the members, before the Branch, and trusted it might be the means of great reform in regard to an ever-growing evil.

Dinner.—Thereafter the members dined in the hotel, Dr. McDiarmid as guest.

THE PUBLIC HEALTH (TUBERCULOSIS) REGULATIONS, 1908.

THE Order of the Local Government Board in England providing for the compulsory notification of pulmonary tuberculosis, the issue of which was briefly noted in the JOURNAL last week, came into force on January 1st. The Order is addressed to the guardians, joint committees and managers of asylums and school districts in England and Wales, and to councils of metropolitan and other boroughs and of urban and rural districts. It is accompanied by two circular letters, the one addressed to the guardians, joint committees and managers of asylum and school districts, and the other to the councils of metropolitan and other boroughs and of urban and rural districts. We reproduce below the circular to the bodies first mentioned.

Local Government Board,
Whitehall, S.W.,
18th December, 1908.

Sir,

I am directed by the Local Government Board to state that they have had under consideration the desirability of affording facilities for the extension of administrative action for the prevention of tuberculosis, and that with this view they have issued an Order in pursuance of Section 130 of the Public Health Act, 1875, as amended and extended by the Public Health (London) Act, 1891, and the Public Health Act, 1896, to provide for the notification to the Medical Officer of Health of Sanitary Authorities of cases of pulmonary tuberculosis occurring amongst the inmates of Poor Law Institutions, or amongst persons under the care of District Medical Officers, and for the taking of certain measures in such cases.

Notification by Medical Officers of Poor Law Institutions.

Article IV of the Order directs that the Medical Officer of a Poor Law Institution, as defined by Article I, shall within 48 hours after his first recognition of the symptoms of pulmonary tuberculosis in the case of a poor person who is an inmate of the institution, post to the Medical Officer of Health of the sanitary district in which the person resided immediately before he became an inmate of the Poor Law Institution a notification of the case.

The notification must be made on a printed form as set out in the Schedule to the Order.

Notification by District Medical Officers.

Article V directs that a similar notification shall be posted to the Medical Officer of Health by the District Medical Officer in the case of any poor person suffering from pulmonary tuberculosis on whom he is in medical attendance according to his agreement with a Board of Guardians.

The notification must be sent within 48 hours after the District Medical Officer has first recognized the symptoms of pulmonary tuberculosis, and must be addressed to the Medical Officer of Health acting for the sanitary district in which the residence of the poor person is situate.

Notification by Superintending Officers of Poor Law Institutions.

Under Article VI it will be the duty of the Superintending Officer of a Poor Law Institution to post to the Medical Officer of Health on a printed form as set out in the Schedule to the Order a notification of the actual or intended place of destination and address at that place of any person leaving the institution in respect of whom a notification has been made by the Medical Officer of the institution under Article IV.

The notification must be posted within forty-eight hours after the departure of the person to whom it relates, and must be sent to the Medical Officer of Health of the sanitary district in which the intended destination of the person is situate. The term "Superintending Officer" is defined in Article I (h).

Notification of Changes of Address by Relieving Officers.
Article VII provides that a Relieving Officer shall notify any change of address (other than by admission to a Poor Law Institution) of a person in respect of whom a notification has been made under Article V by a District Medical Officer.

The notification must be made on a printed form as set out in the Schedule to the Order, and must be sent to the Medical Officer of Health for the sanitary district in which the address to which the person moves is situate.

The notification must be posted within forty-eight hours after the Relieving Officer has obtained accurate information respecting the change of residence.

Remuneration to be allowed.

Provision is made by Article VIII for the remuneration of the Officers who have to make notifications under the Order. In the case of the Medical Officer of a Poor Law Institution or a District Medical Officer, the remuneration will be at the rate of one shilling for every notification, but where in relation to any one case two or more notifications have been posted by the Medical Officer to the same Medical Officer of Health, his remuneration will be at the rate of sixpence for every such notification after the first.

In the case of a Superintending Officer of a Poor Law Institution or a Relieving Officer, the remuneration will be at the rate of threepence for every notification.

The remuneration will be payable by the Council of the sanitary district for which the Medical Officer of Health acts, it will be deemed to cover the cost of postage, and it will be payable in the manner and subject to the conditions prescribed by the Article.

Supply of Forms.

Under Article III of the Order, it will be the duty of the Guardians to provide a sufficient supply of printed copies of each of the Forms A, B, C, D, and E, set forth in the Schedule to the Order, and to furnish to each of the officers who are required to use them a book containing a sufficient number of those copies for the requirements of the officer. The book must be so arranged that every notification can be readily detached from the counterfoil. They must also keep a record of the name and address of the Medical Officer of Health appointed by each Council, and of such other particulars as are necessary to facilitate the prompt delivery of a notification to any such Medical Officer of Health in the ordinary course of post.

Joint Committees constituted under Section 8 of the Poor-law Act, 1879, and the Managers of Asylum Districts and School Districts must keep a like record, and must also provide and furnish their officers with books similar to those above referred to, but containing only Forms A, C, and E.

Expenses of Poor-law Authorities.

Article X provides that all expenses incurred by a Board of Guardians, a Joint Committee, or a Board of Managers under the Order shall be defrayed as part of their establishment expenses.

Determination of Questions or Differences.

Article XI will enable the Board to determine any question or difference in relation to anything done under the Order on the application of any of the parties affected.

Pulmonary Tuberculosis Notifiable under Local Acts.

Article XII deals with those cases in which powers have been obtained with respect to pulmonary tuberculosis by a Local Act.

Nothing in the Regulations will have effect in derogation of any power or obligation under any such Act, but subject to this the Regulations will apply to any district in which a Local Act containing provisions with respect to pulmonary tuberculosis is in force.

The Board may, however, direct that so much of the Regulations as relates to a notification by a Medical Officer of a Poor Law Institution or a District Medical Officer shall not have effect in relation to that district.

Date on which the Order comes into effect.

The Order will take effect on and after January 1st next, and it is desirable that the arrangements which are

¹ Form A is for notification of a person in a Poor-law institution; Form B, of a person in a district; Form C is the notice that a notified person has left a Poor-law institution; Form D, of the change of address of a notified person in a district; Form E, claim for fees payable in respect of notifications.

necessary to facilitate carrying it out should be made without any delay. In fixing January 1st as the date when the Order shall come into operation the Board have had regard to the convenience, from a statistical point of view, of the Order taking effect at the commencement of a calendar year.

If, however, any delay occurs in the printing of the forms, it may be understood that it will not be necessary to carry out the Regulations until these can be obtained.

Copies of the Order and Circular are enclosed, and I am to request that a copy of each may be given to every Officer on whom the duty of notifying rests under Articles IV to VII of the Order. Further copies will be supplied for this purpose on application to the Board, if required.

The Order and Circular will be placed on sale so that copies may shortly be obtained, either directly or through any bookseller, from Messrs. Wyman and Sons, Limited, Fetter Lane, London, E.C.

I am, Sir,

Your Obedient Servant,

S. B. PROVIS,

Secretary.

The Clerk to the Guardians, or to the Joint Committee, or to the Board of Management.

At the end of the Order which was published in the *London Gazette* on December 18th, 1908, the following appears:

Notice.—The Public Health Act, 1896, provides by Subsection 3 of Section 1, that if any person wilfully neglects or refuses to obey or carry out, or obstructs the execution of any regulation made under any of the enactments mentioned in that Act, he shall be liable to a penalty not exceeding one hundred pounds, and, in the case of a continuing offence, to a further penalty not exceeding fifty pounds for every day during which the offence continues.

The circular letter to councils of metropolitan and other boroughs and of urban and rural districts contains the following additional paragraphs:

Enactment and Application of Enactments.

Some of the provisions of the Public Health Act, 1875, and of the Public Health (London) Act, 1891, relative to infectious disease are not usually appropriate in cases of pulmonary tuberculosis.

The Board have, therefore, provided by Article IX. (1) that nothing in the Regulations shall have effect so as to apply or to authorize any one to put in force with respect to a person in relation to whom a notification has been made any enactment which renders him or any other person liable to a penalty or subjects him to any restriction, prohibition, or disability affecting him or his employment, occupation, means of livelihood, or residence on the ground of his suffering from pulmonary tuberculosis.

Special Powers of Councils.

Subject to what is stated in the preceding paragraph, it is desirable that Sanitary Authorities acting on the advice of their Medical Officers of Health should utilize their powers for the purpose of preventing the spread of infection from pulmonary tuberculosis. The Order confers some special powers which the Board are advised are suitable for this purpose, and which are set out in Article IX. (2) of the Order.

The Board propose to issue for the use of Sanitary Authorities and Medical Officers of Health a memorandum by their Medical Officer setting out the appropriate action that can be taken under these powers. Copies of the memorandum will be sent to the Council in due course.

It is also stated that in places in which powers have been obtained with respect to pulmonary tuberculosis by a local Act, the Board in deciding whether so much of the regulations as relates to a notification by a medical officer of a Poor-law medical institution, or a district medical officer, shall not have effect in that district, shall be moved to act by the council of the district.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

The following appointments have been made at the Admiralty: Fleet Surgeon E. A. SEAW, M.B., to the *Tamar*, December 26th, 1908; Staff Surgeon ALFRED WOOLCOMBE, to the *Charybdis*, December 19th, 1908; Staff Surgeon J. G. WALLIS, M.B., to the *Penbrooke*, December 19th, 1908; Staff Surgeon C. R. NICHOLSON, to the *Drake*, December 19th, 1908; Surgeon W. J. STITT, to the *Dunfer*, additional, December 19th,

1908, and on recommissioning, undated; Surgeon R. F. MACMAHON, to the *Fintona*, additional, December 19th, 1908, and on recommissioning, undated; Fleet Surgeons A. F. HARRER, A. G. ANDREWS, W. H. S. STICKLAND, M.D., and C. S. STICKLAND, Staff Surgeons B. B. MACDONALD, M.B., and J. VIELAND, and Surgeons C. J. O'CONNELL, G. D. BATEMAN, and E. R. TOWNSEND, all to the *President*, additional, for three months' course at West London Hospital, January 11th; Staff Surgeon W. E. MARTIN, to the *Corona*, January 11th; Staff Surgeon C. G. KELLY, to the *Fulham*, on recommissioning, January 5th; Staff Surgeon W. L. MARTIN, to the *assistance*, January 11th; Surgeon G. M. LEVICK, to the *Ganges*, for Shotley Sick Quarters and for physical training duties, January 11th; Surgeon A. D. C. CEMINS, to the *Pogues*, additional, January 2nd, and on recommissioning, undated; Surgeon D. B. CARLSON, to the *Sealark*, additional, January 2nd, and on recommissioning; Surgeon A. L. ROBINSON, M.B., to the *Dreadnought*, January 2nd; Surgeon S. F. DUDLEY, to the *Barfleur*, January 2nd; Surgeon W. E. GRAY, to the *Tamar*, additional, for dockyard, July 2nd, December 2nd, 1908; Surgeon C. ROSS, to the *Woodark*, December 2nd, 1908; Surgeon P. F. MINETT, to the *Tamar*, December 2nd, 1908; Surgeon G. B. SCOTT, to the *Nightingale*, December 2nd, 1908; Surgeon C. R. M. BAKER, M.B., to the *Sandpiper*, December 2nd, 1908; Surgeon T. E. BLUNT, to the *Halcyon*, December 2nd, 1908; Surgeon R. M. RIGGALL, to the *Warrior*, December 2nd, 1908; Surgeon D. H. C. GIVEN, to the *Anconemmon*, December 2nd, 1908.

ROYAL ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

LIEUTENANT-COLONEL A. G. KAY, M.B., retires on retired pay, December 23rd, 1908. He was appointed Surgeon, February 5th, 1881; Surgeon-Major, February 9th, 1893; and Lieutenant-Colonel, February 9th, 1903. He was in the Egyptian war in 1882, receiving a medal and the Khedive's bronze star.

TERRITORIAL FORCE.

UNARMED VOLUNTEERS.

SURGEON-MAJOR C. L. FRASER, from the 1st Herby-on-Tweed Royal Garrison Artillery (Volunteers), to be Surgeon-Major, with precedence as in the Volunteer Force, April 1st, 1908.

ROYAL ARMY MEDICAL CORPS.

Captain (Honorary Major in the Army) C. STONHAM, C.M.G., to be Major, April 1st, 1908.

For Attachment to Units other than Medical Units.—Surgeon-Captain E. P. COKE, from the 2nd Middlesex (South Middlesex) Volunteer Rifle Corps, to be Captain, with precedence as in the Volunteer Force, April 1st, 1908; Surgeon-Captain G. A. TROOP, M.D., from the 2nd East Anglian Brigade Royal Field Artillery, to be Captain, with precedence from August 9th, 1899, April 1st, 1908; Captain G. A. TROOP, M.D., to be Major, April 1st, 1908; Surgeon-Lieutenant K. S. STORRS, M.B., from the 5th Battalion the Essex Regiment, to be Lieutenant, with precedence from March 6th, 1908, April 1st, 1908.

Second Home Counties Field Ambulance.—Lieutenant R. M. GHOUGH resigns his commission, October 19th, 1908.

Fourth London Field Ambulance.—Quartermaster and Honorary Lieutenant H. E. MATHURSON resigns his commission, October 26th, 1908; he is appointed Lieutenant from the same date. P. W. THOMSON to be Lieutenant, October 24th, 1908. J. R. HOLMES, M.B., to be Lieutenant, October 26th, 1908.

Second North Midland Field Ambulance.—R. K. HAMILTON to be Lieutenant, November 15th, 1908.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 7,707 births and 4,749 deaths were registered during the week ending Saturday, December 19th, 1908. The annual rate of mortality in these towns, which had been 15.6 and 15.5 per 1,000 in the two preceding weeks, further fell to 15.3 per 1,000 in the week under notice. The rates in the several towns ranged from 6.2 in Hornsey, 8.0 in East Ham, 8.3 in Reading, 7.6 in Snettisham, 9.3 in King's Norton and in Gateshead, 9.6 in Willemsden, and 10.0 in Birkhead to 20.5 in Devonport and in Newcastle-on-Tyne, 20.9 in West Bromwich, 21.2 in Preston, 22.9 in Rochdale, 23.7 in Huddersfield, 24.7 in Middlesbrough, and 24.9 in Oldham. In London the rate of mortality was equal to 14.8 per 1,000, while it averaged 15.5 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.3 per 1,000 in the seventy-six towns; in London this death-rate was equal to 1.4 per 1,000; while among the seventy-five other large towns the death-rates from the principal infectious diseases ranged upwards to 2.9 in Wigan, 3.1 in Warrington, and in Stockton-on-Tees, 3.7 in Oldham, 3.9 in Huddersfield, 4.5 in Middlesbrough, 5.2 in Leicester, and 6.5 in Rotherham. Measles caused a death-rate of 1.7 in Sunderland, 1.8 in Oldham, 2.2 in Warrington, 3.3 in Rotherham, 3.5 in Middlesbrough, 3.9 in Huddersfield, 4.4 in Wigan, 4.8 in Warrington, 5.0 in Willemsden, and 2.0 in Stockton-on-Tees; whooping-cough of 1.2 in Wigan, 1.5 in West Bromwich, and 2.5 in Rotherham; "fever" of 1.2 in Wigan and 1.5 in Grimsby; and diarrhoea of 1.1 in Oldham. The mortality from scarlet fever showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The number of scarlet fever cases remaining under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital at the end of the week was 3,537, 3,679, 3,833, 3,797, and 3,702, in the five preceding weeks; 381 new cases were admitted during the week, against 495, 406, and 426 in the three preceding weeks.

In seventy-six of the largest English towns, including London, 5,752 births and 4,000 deaths were registered during the week ending Saturday, December 26th, 1908. The annual rate of mortality in these towns, which had been 15.5 and 15.3 per 1,000 in the two preceding weeks, further fell last week to 12.8 per 1,000. The rates in the several towns ranged from 4.4 in Hounslow, 4.5 in Willemsden, 5.8 in East Ham, 6.1 in Wallasey, 6.2 in Houssey, 6.7 in Wallingstone, 7.7 in Devonport, and 8.4 in Brighton and in Bolton, to 18.5 in Salford, 18.6 in Preston, 18.8 in Blackburn, 19.2 in Sunderland, 20.1 in Oldham, 20.3 in Hury and Newbert (Mon.), and 22.3 in Rochdale. The rate of mortality was 11.3 per 1,000, while it averaged 13.5 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.3 per 1,000 in the seventy-six towns; in London this death-rate was equal to 1.4 per 1,000; while among the seventy-five other large towns the death-rates from the principal infectious diseases ranged upwards to 2.9 in Oldham, 3.1 in Bolton and in Salford, 4.1 in Rochdale, 4.8 in Leicester, and 5.1 in Warrington. Measles caused a death rate of 1.1 in Huddersfield, 1.2 in

Leyton, 1.5 in Bootle, in Warrington, and in Oldham, 1.6 in Rotherham, 1.7 in Hull, 2.0 in Sunderland, 2.9 in Rochdale, and 4.1 in Leicester; scarlet fever, of 1.1 in Northampton, and in St. Helens, and 2.2 in Warrington; diphtheria, of 1.1 in Great Yarmouth; whooping-cough, of 1.2 in York, 1.3 in West Ham, and 1.7 in Wigan; and diarrhoea, of 1.2 in Rochdale and 1.5 in Bootle. The mortality from "fever" was not excessive in any of the large towns, and no fatal case of small-pox was registered during the week. The majority of scarlet fever cases under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 3,747, 3,703, and 3,557 at the end of the three preceding weeks, was 3,458 at the end of last week; 391 new cases were admitted during the week, against 465, 425, and 381 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In eight of the principal Scottish towns, 829 births and 585 deaths were registered during the week ending December 19th, 1908. The annual rate of mortality in these towns, which had been 16.4, 16.5, and 15.2 per 1,000 in the three preceding weeks, rose again to 16.6 per 1,000 in the week under notice, and was 1.5 per 1,000 above the mean rate during the same period in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 13.6 in Leith and 15.6 in Paisley to 17.6 in Dundee and in Aberdeen, and 25.7 in Perth. The death-rate from the principal infectious diseases averaged 1.6 per 1,000, the highest rates being recorded in Glasgow and Aberdeen. The 257 deaths registered in Glasgow included 6 which were referred to diphtheria, 20 to whooping-cough, 5 to cerebro-spinal meningitis, and 10 to diarrhoea. Three fatal cases of diarrhoea were recorded in Dundee and 2 in Edinburgh, and 2 of measles in Aberdeen.

During the week ending Saturday last, December 26th, 1908, 779 births and 567 deaths were registered in these eight towns. The annual rate of mortality declined to 16.1 per 1,000, but was 1.3 per 1,000 above the mean rate last week in the seventy-six large English towns. The rates in the eight Scottish towns last week ranged from 10.3 in Perth and 12.0 in Aberdeen to 17.3 in Leith and 25.7 in Dundee. The death-rates from the principal infectious diseases averaged 1.4, the highest rates being recorded in Aberdeen and Paisley. The 244 deaths registered in Glasgow included 5 from diphtheria, 16 from whooping-cough, 4 from "fever," and 4 from diarrhoea. Three fatal cases of whooping-cough were recorded in Edinburgh; 2 of diphtheria and 3 of diarrhoea in Aberdeen, 2 of diphtheria in Paisley, and 2 of diarrhoea in Dundee.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, December 19th, 1908, 543 births and 418 deaths were registered in the twenty-two principal urban districts of Ireland, as against 552 births and 428 deaths in the preceding period. The annual death-rate in these districts, which had been 19.8, 20.3, and 19.7 per 1,000 in the three preceding weeks, fell to 19.3 per 1,000 in the week under notice, this figure being 4.0 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 18.0 and 19.7 respectively, those in other districts ranging from 4.3 in Lurgan and 6.9 in Armagh to 32.7 in Wexford and 55.2 in Portadown, while Cork stood at 31.5, Londonderry at 19.5, Limerick at 19.1, and Waterford at 15.6. The zymotic death-rate in the twenty-two districts averaged 1.1 per 1,000, or the same as in the preceding period.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column, advertisements must be received not later than the first post on Wednesday morning.

VACANCIES.

BIRMINGHAM CITY ASYLUM.—Assistant Medical Officer. Salary, £50 per annum.

BOURNEMOUTH.—ROYAL BOSCOMBE AND WEST HANTS HOSPITAL.—House-Surgeon. Salary, £80 per annum.

BRENTFORD UNION.—Assistant Medical Superintendent of the Infirmary and Assistant Medical Officer of Workhouse and Schools. Salary, £120 per annum.

BRIDGWATER HOSPITAL.—House-Surgeon. Salary at the rate of £20 per annum.

CHELSEA HOSPITAL FOR WOMEN. Fulham Road, S.W.—House-Surgeon. Salary, £80 per annum.

CHELTHAM GENERAL HOSPITAL.—Surgeon in charge of Branch Dispensary. Salary £80 per annum, and £10 allowance in lieu of cab hire.

EDINBURGH UNIVERSITY.—Additional Examiner in Public Health and in Practice of Medicine.

GLOUCESTER GENERAL INFIRMARY.—Assistant Physician.

HOSPITAL FOR SICK CHILDREN. Great Ormond Street, W.C.—House-Physician. Salary, £30 for six months, and £2 10s. washing allowance.

HULL ROYAL INFIRMARY.—Casualty House-Surgeon. Salary at the rate of £60 per annum for six months, or £20 per annum for twelve months.

KING'S LYNN BOROUGH.—Medical Officer of Health. Salary, £300 per annum.

LEAMINGTON SPA ROYAL BOROUGH.—Assistant Medical Officer of Health. Salary, £250 per annum.

LEICESTER CORPORATION.—Resident Medical Officer at the Isolation Hospital, and Assistant Medical Officer of Health. Salary, £150 per annum.

LEVES DISPENSARY AND INFIRMARY AND VICTORIA HOSPITAL.—Resident Medical Officer. Salary, £120 per annum.

LIVERPOOL PARISH.—Assistant Medical Officer for the Workhouse. Salary, £80 per annum, and £20 for examining applicants for outdoor relief.

METROPOLITAN HOSPITAL. Kingsland Road, N.E.—Resident Anaesthetist. Salary, £50 per annum.

NEWCASTLE-UPON-TYNE CITY LUNATIC ASYLUM. Gosforth.—Second Assistant Medical Officer. Salary £140 per annum, rising to £160.

NOTTINGHAM GENERAL DISPENSARY.—Assistant Resident Surgeon male. Salary, £160 per annum.

NOTTS CONSUMPTION SANATORIUM.—Resident Medical Officer (female). Salary, £100 per annum.

NOTTS COUNTY LUNATIC ASYLUM, Radcliffe-on-Trent.—Medical Superintendent. Salary, £600 per annum.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

THE British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. Od., and the BRITISH MEDICAL JOURNAL is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association, and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the BRITISH MEDICAL JOURNAL for non-members is £1 8s. Od. for the United Kingdom, and £1 15s. Od. for abroad.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BURMAH BRANCH.

The general meeting of this Branch was held at the General Hospital, Rangoon, on November 26th, 1908.

Election of Officers.—The following were elected to office for the year 1909: *President*, Colonel W. G. King, C.I.E., M.B., I.M.S., Rangoon; *Vice-Presidents*, Lieutenant-Colonel R. E. S. Davis, M.B., I.M.S., Rangoon, Dr. Padley, Rangoon; *Honorary Secretary and Treasurer*, Captain H. H. G. Knapp, M.A., M.D., B.Ch., I.M.S., Rangoon; *Members of Branch Council*, Dr. Finlay, Dr. Parakh, Major E. R. Rost, I.M.S., Dr. Joy, Lieutenant-Colonel P. C. H. Gordon, R.A.M.C.

CAPE OF GOOD HOPE, EASTERN PROVINCE, BRANCH.

The regular meeting was held at 8 p.m. on Friday, July 24th, 1903, in the library of the Association at Rhodes College, Dr. R. C. MULLINS in the chair. There were present: Drs. Bruce-Bays, Greathead, Lea, Lillie, Purvis, and Drury. Professors Cory, Duerden, MacLylean, Matthews, Ogg, Schouland, and Schwartz, all of Rhodes University College, were also present as visitors.

Confirmation of Minutes.—The minutes of the meeting of May 29th were read and confirmed.

South African Committee of the Association.—It was resolved that the delegates should press for the following points:

1. Annual meeting to synchronize with Medical Congress.
2. Other meetings to be quarterly.
3. Small executive to have power to deal with emergencies and report.
4. Subscription to be small, say 2s. 6d. or 5s.
5. Clause 24 of regulations to be expanded.
6. Duties of committee, during continuance of hard times, to be advisory only, any scheme of medical defence or benevolence to be taken in hand with the greatest caution and after the fullest canvass of existing members of the British Medical Association.

Address.—After the Rhodes Professors had been welcomed, Dr. G. C. PURVIS gave an account of the various theories of the origin of cancer, and demonstrated microscopical sections. A practical discussion followed.

A regular meeting was held on Friday, October 9th, 1903, Dr. R. C. MULLINS in the chair. There were present: Drs. FitzGerald, Lillie, Jones-Phillipson, Purvis, and Dr. Drury. Drs. Harrison, of Grahamstown, and Cowper, of the Grahamstown Asylum, were present as visitors.

Confirmation of Minutes.—The minutes of the meeting of July 24th were read and confirmed.

Medical and Pharmacy Act.—In regard to the administration of the Medical and Pharmacy Act as announced in the *Gazette* of July 21st, 1903, p. 265, it was resolved:

That this Branch supports the action of the Western Province Branch in their protest against the decision of the Government as published in the above notice.

Paper.—Dr. C. E. JONES-PHILLIPSON read a paper on tinnitus aurium, since published in the *South African Medical Record*.

Votes of Thanks.—Votes of thanks were passed to Dr. Greathead for his gift of the *BRITISH MEDICAL JOURNAL* from 1871 to date; to Professor Cory for *Vanity Fair* sketch of Sir James Paget; to Dr. H. F. Becker for the *Lancet* (bound) from 1872 to 1890 and the *London Medical Record* from 1879 to 1887, and, through the Secretary, of Braithwaite's *Retrospect of Medicine*, 1845 to 1855 and 1881 to 1892.

Annual Meeting.

The annual meeting was held on Friday, December 4th, 1908, Dr. R. C. MULLINS in the chair. There were present: Drs. Bruce-Bays, Drury, FitzGerald, Lillie, and Purvis; Drs. Lex Gordon and Cowper (Grahamstown) were present as visitors.

Refreshment Subscription.—It was resolved that a local refreshment subscription of 5s. per annum be levied.

Election of Officers.—The following were elected officers of the Branch by the postal ballot: *President*, Dr. Gerald FitzGerald; *President-elect*, Dr. P. B. Grentell; *Secretary*, Dr. E. G. Drury; *Treasurer*, Dr. E. G. Drury. *Council* (nine in all)—(1) Grahamstown: Drs. H. Becker, J. Bruce-Bays, C. F. Lillie, R. C. Mullins, G. C. Purvis; (2) Area: Drs. A. Gooding, J. B. Greathead, C. E. Jones.

Phillipson, G. W. Smith; *Member of Central Council*, Dr. T. D. Greenlees.

East London Congress.—Dr. J. BRUCE-BAYS reported on the East London Congress.

Report of Honorary Secretary and Treasurer.—The report of the Honorary Secretary and Treasurer for 1908 was adopted.

Library.—Grocott and Sherry's tender for binding library books was accepted.

President's Address.—Dr. MULLINS read his Presidential Address, which was entitled "Personal Experiences."

Proposed Dinner.—It was resolved that a dinner should precede the first meeting in February, 1909.

HONG KONG AND CHINA BRANCH.

Annual Meeting.

The annual general meeting of this Branch was held in the Sanitary Board Room on November 26th, 1908. Dr. G. M. HARSTON, the President, was in the chair, and more than twenty-five members were present.

President's Address.—The President opened the proceedings with an address on the work of the Branch during the past year.

Report of Honorary Secretary and Treasurer.—This was followed by the report of the Honorary Secretary and Treasurer, Dr. Sanders, which showed the Branch to be in a flourishing condition. They now had 130 medical men as members, extending throughout districts right into the far western portion of China. It was a striking fact that some of those medical men in the far western districts had been among the subscribers to the library fund. During the past years the small grant from the parent Association had been accumulating in the bank, and the council decided to invest the money in the purchase of the latest works of reference to enable local practitioners, as well as naval surgeons, to have an opportunity of referring to the best authorities of the day. With that end in view, the council had secured portion of an office, situated at No. 17A, Queen's Road Central, where any medical man, who was a member of the Association, might refer to these books.

Election of Officers.—The following officers were elected for the ensuing year: *President*, Deputy Inspector General W. Tait, M.B.; *Vice-President*, Dr. G. M. Harston; *Honorary Secretary and Treasurer*, Dr. J. H. Sanders; *Council*, the President, the Vice-President, the Honorary Secretary and Treasurer, Drs. Stedman, Jordan, and Atkinson, Staff Surgeon Baiss, Naval Hospital, and Captain Collingwood, R.A.M.C.; *Library Committee*, Dr. Black, Major Probyn, R.A.M.C., and Staff-Surgeon Beadnell, R.N.

Installation of New President.—Deputy Inspector-General TAIT was then inducted to the chair, and gave his inaugural address as President, his subject being the relation of the Naval Medical Service to the other branches of the profession.

London School of Tropical Medicine.—Sir FRANCIS LOVELL then brought the aims of the London School of Tropical Medicine, of which he is Dean, before the meeting. He drew special attention to the fact that, in going over the list, he found that no fewer than fifty medical practitioners in the treaty ports of China and in Hong Kong had passed through the school since its establishment in 1899, and of that number six came from Hong Kong. Any medical practitioner resident in a colony—like Hong Kong, for instance—which subscribed to the school had the privilege of going through a course at the school without the usual payment of fees. This privilege, Sir Francis pointed out, had not been taken advantage of up to the present in Hong Kong to the extent he would desire. Now, however, that the contribution of the colony was going to be renewed, he hoped the medical gentlemen of Hong Kong would avail themselves of the opportunity afforded of a free course of tuition in tropical medicine. During his former visit to the colony in 1902 a small committee was appointed, consisting of Drs. Atkinson, Ho Kai, and Rennie (the last named being the secretary), with power to add to their number, and the result of that action was that a sum of about \$2,500 was collected. He would ask the members of the Association to be good enough to advise him as to what action was most likely to lead to the results he hoped

to attain in connexion with his present mission, which was that of raising a fund of at least £25,000 to assure the permanence of the school and enable it to extend its sphere of operations. Out of the 150 members of the British Medical Association in China and Hong Kong, 50 had passed through the school, and they might materially help by bringing its aims and objects to the notice of the wealthy inhabitants of the cities in which they were located. It had been suggested that a public meeting be held in Hong Kong at which he might give an address. His experience of public meetings in the East had not been satisfactory either in attendance or results. He attributed this mainly to the fact that it was very difficult to make the subject of tropical medicine sufficiently interesting to attract the general public. However, he should be very glad indeed, if it were decided otherwise, to prepare an address on the subject. It would be most desirable if His Excellency the Governor was asked to preside. This was a matter he would leave to the members of the Association. Sir Francis intimated that on the occasion of his last visit the Hong Kong and Shanghai Bank and Messrs. Jardine, Matheson and Co. each subscribed \$500 to open the list. On this occasion Messrs. Jardine, Matheson and Co. had already come forward with a donation of \$500. As a result of Sir Francis Lovell's speech it was decided to form a sub-committee—consisting of Dr. Jordan, Dr. Harston, and Dr. Sanders, with power to add to their number—to ascertain what could be done among the residents and Chinese of Hong Kong in assisting the work of the London School of Tropical Medicine. It was felt that this was a subject in which the Chinese, who were benefited to a great degree, would assist.

Future Meetings.—The following dates were fixed for meetings: December 27th, January 21st, February 18th, March 18th, April 15th.

Cases.—Cases were shown by Fleet Surgeons GILMOUR and BEADNELL, R.N.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

LANCASHIRE AND CHESHIRE BRANCH.—Several Divisions have asked the Branch Secretary to assist them in drawing up a clinical and scientific programme for their winter meetings by letting them know of gentlemen who would be willing to read papers or to give demonstrations at meetings of Divisions other than their own. The Honorary Secretary would accordingly be pleased to know of any members willing to give such papers or demonstrations, so that he may be able to submit them to the Divisions.—F. CHARLES LARKIN, Branch Secretary, Liverpool.

LANCASHIRE AND CHESHIRE BRANCH: WARRINGTON DIVISION. The meeting of this Division on December 29th, 1908, was adjourned to January 11th, 1909, and will be held at the infirmary, Warrington, on that date at 4 p.m.—T. A. MURRAY, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.—There will be a meeting of the Kensington Division, at the Kensington Town Hall, on Thursday, January 21st, at 5 p.m., when Mr. L. A. Bidwell will give an address on the immediate and ultimate results of gastro-enterostomy for gastric and duodenal ulcer.—H. BECKETT OVERY, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: RICHMOND DIVISION.—A special meeting will be held on January 27th at 8.30 p.m. at the Bridge House Café, Richmond Bridge, to consider the Report on the Medical Inspection of School Children.—G. CARDNO STILL, Honorary Secretary.

ULSTER BRANCH.—The winter meeting of this Branch will be held in Belfast on Wednesday, February 3rd. Members having communications are requested to send particulars not later than January 23rd to CECIL SHAW, M.D., Honorary Secretary, Belfast.

POISONS AND PHARMACY ACT, 1908.

[8 EDW. 7. CH. 55.]

ARRANGEMENT OF SECTIONS.

Section.

1. Amendment of 31 and 32 Vict. c. 121, Schedule A.
2. Regulation of sale of certain poisonous substances for agricultural and horticultural purposes.
3. Amendment of 31 and 32 Vict. c. 121, ss. 15 and 16.
4. Extension of powers of Pharmaceutical Society to make byelaws.
5. Restrictions on sale of certain poisonous substances.
6. Application to Ireland.
7. Continuation of business on death of chemist and druggist or registered druggist in Ireland.
8. Short title, commencement, and extent.

SCHEDULE.

CHAPTER 55.

An Act to Regulate the Sale of Certain Poisonous Substances and to Amend the Pharmacy Acts.

[21st December, 1908.]

BE it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

1. *Amendment of 31 and 32 Vict. c. 121, Schedule A.*—(1) Schedule A. to the Pharmacy Act, 1868 (which specifies the articles to be deemed poisons within the meaning of that Act), is hereby repealed, and the schedule to this Act shall be substituted therefor.

(2) The schedule to this Act may be amended by adding thereto or removing therefrom any article, or by transferring any article from one part of the schedule to the other in the manner provided by section two of the Pharmacy Act, 1868, for adding to the list of articles deemed to be poisons within the meaning of that Act.

2. *Regulation of Sale of Certain Poisonous Substances for Agricultural and Horticultural Purposes.*—(1) So much of the Pharmacy Act, 1868, as makes it an offence for any person to sell or keep open shop for the sale of poisons, unless he is a duly registered pharmaceutical chemist or chemist and druggist and conforms to regulations made under section one of that Act, shall not apply in the case of poisonous substances to be used exclusively in agriculture or horticulture for the destruction of insects, fungi, or bacteria, or as sheep dips or weed killers which are poisonous by reason of their containing arsenic, tobacco, or the alkaloids of tobacco, if the person so selling or keeping open shop is duly licensed for the purpose under this section by a local authority, and conforms to any regulations as to the keeping, transporting, and selling of poisons made under this section, but nothing in this section shall exempt any person so licensed from the requirements of any other provision of the Pharmacy Act, 1868, or of the Arsenic Act, 1851, relating to poisons:

Provided that His Majesty may by Order in Council amend this provision by adding thereto or removing therefrom any poisonous substance, and, upon any such Order being made, this provision shall have effect as if the added poisonous substances were included therein and the removed poisonous substances were excluded therefrom.

(2) Before granting any licence under this section the local authority shall take into consideration whether in the neighbourhood where the applicant for the licence carries on or intends to carry on business the reasonable requirements of the public with respect to the purchase of such poisonous substances as aforesaid are satisfied.

(3) His Majesty may, by Order in Council, make regulations as to—

- (a) the granting of licences under this section; and
- (b) the duration, renewal, revocation, suspension, extent, and production of such licences; and
- (c) the keeping, inspection, and copying of registers of licences; and
- (d) the fees to be charged for licences and for inspection and copying of registers; and
- (e) the keeping, transporting, and selling of the poisonous substances to which this section applies;

and generally for the purposes of carrying this section into effect.

(4) The local authority for the purposes of this section shall, as respects the area of any municipal borough in England having a population of more than ten thousand according to the last published census for the time being, be the council of that borough, and, as respects the area of any royal, parliamentary, or police burgh in Scotland, be the town council, and, as respects any other place, be the council of the county.

(5) An Order in Council under this section shall be laid before both Houses of Parliament as soon as may be after it is made.

3. *Amendment of 31 and 32 Vict. c. 121, ss. 15 and 16.*—(1) Any person who, being a duly registered pharmaceutical chemist or chemist and druggist, carries on the business of pharmaceutical chemist or chemist and druggist shall, unless in every premises where the business is carried on the business is bona fide conducted by himself or some other duly registered pharmaceutical chemist or chemist and druggist, as the case may be, and unless the name and certificate of qualification of the person by whom the business is so conducted in any premises is conspicuously exhibited in the premises, be guilty of an offence under section fifteen of the Pharmacy Act, 1868.

(2) The provisions of section sixteen of the Pharmacy Act, 1868, which enable the executor, administrator, or trustee of the estate of a deceased pharmaceutical chemist or chemist and druggist to continue his business so long as such business is bona fide conducted by a duly qualified assistant, shall be construed as enabling such executor, administrator, or trustee to carry on the business if and so long only as, in every premises where the business is carried on, the business is bona fide conducted by a duly registered pharmaceutical chemist or chemist and druggist, as the case may be, and the name and certificate of qualification of the person by whom the business is so conducted in any premises is conspicuously exhibited in the premises.

(3) A registered chemist or druggist may, notwithstanding anything in section fifteen of the Pharmacy Act, 1868, take, use, or exhibit the name or title of pharmacist.

(4) A body corporate, and in Scotland a firm or partnership, may carry on the business of a pharmaceutical chemist or chemist and druggist—

(a) if the business of the body corporate, firm, or partnership, so far as it relates to the keeping, retailing, and dispensing of poisons, is under the control and management of a superintendent who is a duly registered pharmaceutical chemist or chemist and druggist, whose name has been forwarded to the registrar appointed under the Pharmacy Act, 1852, to be entered by him in a register to be kept for that purpose, and who does not act at the same time in a similar capacity for any other body corporate, firm, or partnership; and

(b) if in every premises where such business as aforesaid is carried on, and is not personally conducted by the superintendent, such business is bona fide conducted under the direction of the superintendent by a manager or assistant who is a duly registered pharmaceutical chemist or chemist and druggist, and whose certificate of qualification is conspicuously exhibited in the shop or other place in which he so conducts the business.

A body corporate, and in Scotland a firm or partnership, may use the description of chemist and druggist, or of chemist or of druggist, or of dispensing chemist or druggist, if the foregoing requirements as to the carrying on of the business are observed, and if the superintendent is a member of the board of directors or other governing body of the body corporate, or of the firm or partnership, as the case may be.

Subject as aforesaid, section twelve of the Pharmacy Act, 1852, and sections one and fifteen of the Pharmacy Act, 1868, shall apply to a body corporate, and in Scotland to a firm or partnership, in like manner as they apply to an individual.

4. *Extension of Powers of Pharmaceutical Society to make Byelaws.*—The power of making byelaws conferred by section two of the Pharmacy Act, 1852, on the council

of the Pharmaceutical Society shall be deemed to include the power of making by-laws for all or any of the following purposes (that is to say):

- (a) Requiring persons desirous of presenting themselves for examination by the said society to produce evidence satisfactory to the council of the society that they have received a sufficient preliminary practical training in the subjects of the examination;
- (b) Providing for the registration, upon payment of the prescribed fee, as pharmaceutical chemists or chemists and druggists under the Pharmacy Acts, 1852 and 1868, without examination, of any persons holding colonial diplomas or of qualified military dispensers or certified assistants to apothecaries under the Apothecaries Act, 1815, who produce evidence satisfactory to the council of the society that they are persons of sufficient skill and knowledge to be so registered;
- (c) Providing for periods of time and courses of study in connexion with the qualifying examination, and dividing such examination into two parts.

5. Restrictions on Sale of Certain Poisonous Substances.—(1) It shall not be lawful to sell any substance to which this section applies by retail, unless the box, bottle, vessel, wrapper, or cover in which the substance is contained is distinctly labelled with the name of the substance and the word "Poisonous," and with the name and address of the seller of the substance, and unless such other regulations as may be prescribed under this section by Order in Council are complied with; and, if any person sells any such substance otherwise than in accordance with the provisions of this section or of any Order in Council made thereunder, he shall, on conviction under the Summary Jurisdiction Acts, be liable for each offence to a fine not exceeding five pounds.

(2) The substances to which this section applies are sulphuric acid, nitric acid, hydrochloric acid, soluble salts of oxalic acid, and such other substances as may for the time being be prescribed by Order in Council under this section.

6. Application to Ireland.—(1) The provisions of section two and section five of this Act shall apply to Ireland, with the following modifications:—

- (a) For the reference to the Pharmacy Act, 1868, there shall be substituted a reference to the Pharmacy Act (Ireland), 1875, and the Pharmacy Act (Ireland) (1875) Amendment Act, 1890, and the reference to regulations made under section one of the first mentioned Act shall not apply;
- (b) For references to Orders in Council by His Majesty, or to Orders in Council, there shall be substituted references to Orders in Council by the Lord Lieutenant;
- (c) The reference to a duly registered chemist and druggist shall include a reference to a registered druggist.

(2) Save as provided by this section, the foregoing provisions of this Act shall not apply to Ireland.

7. Continuation of Business on Death of Chemist and Druggist or Registered Druggist in Ireland.—Upon the death of any person registered under the Pharmacy Act (Ireland) (1875) Amendment Act, 1890, as a chemist and druggist or registered druggist and actually in business at the time of his death, it shall be lawful for any executor, administrator, or trustee of his estate to continue such business if and so long only as such business is bona fide conducted by an assistant being a duly registered pharmaceutical chemist or licentiate apothecary, or duly registered chemist and druggist, or duly registered druggist.

8. Short Title, Commencement, and Extent.—This Act may be cited as the Poisons and Pharmacy Act, 1908, and shall come into operation on the first day of April nineteen hundred and nine.

SCHEDULE.

PART I.

Arsenic, and its medicinal preparations.

Aconite, aconitine, and their preparations.

Alkaloids—all poisonous vegetable alkaloids not specifically named in this schedule, and their salts, and all poisonous derivatives of vegetable alkaloids.

Atropine, and its salts, and their preparations.

Belladonna, and all preparations or admixtures (except belladonna plasters) containing 0.1 or more per cent. of belladonna alkaloids.

Cantharides, and its poisonous derivatives.

Coca, any preparation or admixture of, containing 1 or more per cent. of coca alkaloids.

Corrosive sublimate.

Cyanide of potassium, and all poisonous cyanides and their preparations.

Emetic tartar, and all preparations or admixtures containing 1 or more per cent. of emetic tartar.

Ergot of rye, and preparations of ergots.

Nux vomica, and all preparations or admixtures containing 0.2 or more per cent. of strychnine.

Opium, and all preparations or admixtures containing 1 or more per cent. of morphia.

Picrotoxin.

Prussic acid, and all preparations or admixtures containing 0.1 or more per cent. of prussic acid.

Savin, and its oil, and all preparations or admixtures containing savin or its oil.

PART II.

Almonds, essential oil of (unless deprived of prussic acid).

Antifominal wine.

Cantharides, tincture and all vesicating liquid preparations or admixtures of.

Carbolic acid, and liquid preparations of carbolic acid, and its homologues containing more than 3 per cent. of those substances, except preparations for use as sheep wash or for any other purpose in connection with agriculture or horticulture, contained in a closed vessel distinctly labelled with the word "Poisonous," the name and address of the seller, and a notice of the special purposes for which the preparations are intended.

Chloral hydrate.

Chloroform, and all preparations of admixtures containing more than 20 per cent. of chloroform.

Coca, any preparation or admixture of, containing more than 0.1 per cent. but less than 1 per cent. of coca alkaloids.

Digitalis.

Mercuric iodide.

Mercuric sulphocyanide.

Oxalic acid.

Poppies, all preparations of, excepting red poppy petals and syrup of red poppies (*Papaver rhoeas*).

Precipitate, red, and all oxides of mercury.

Precipitate, white.

Strophanthus.

Sulphonal.

All preparations or admixtures which are not included in Part I. of this schedule, and contain a poison within the meaning of the Pharmacy Acts, except preparations or admixtures the exclusion of which from this schedule is indicated by the words therein relating to carbolic acid, chloroform, and coca, and except such substances as come within the provisions of section five of this Act.

CENTRAL MIDWIVES BOARD.

A MEETING of the Central Midwives Board was held at Caxton House, Westminster, on December 17th, 1908, with Dr. F. H. CHAMPEYNS in the chair.

Departmental Committee on the Midwives Act.

THE CHAIRMAN reported that he had attended on December 16th the first meeting of the Departmental Committee on the working of the Midwives Act. This committee is instructed, among other matters, to inquire into the subject of the remuneration of medical men called in under the Act.

Board's Examination.

A letter was considered from the Marchioness of Winchester, Vice-President of the Hampshire County Nursing Association, suggesting a modification of the present requirements of the Board's examination. The Board decided that the writer be informed that the Board is unable to take steps tending to lower the standard of examination, and pointing out that a glossary is supplied for the assistance of candidates studying the rules.

Rules.

Letters were considered from the Clerk of the West Sussex County Council, suggesting the framing of rules: (1) Prohibiting a midwife in attendance on a patient suffering from puerperal fever from taking another labour case for a month; (2) compelling midwives to notify to the local supervising authority cases in which they lay out dead bodies, and cases of infectious illness attended by them. The Board passed the following resolutions thereon:

1. That prolonged suspension after infection is not to be recommended: (a) because suspension without adequate

disinfection is useless, (b) because adequate disinfection renders suspension unnecessary. The time of suspension from practice should be limited to the time required for adequate disinfection, which should not take longer than twenty four hours.

2. That the suggestion be noted for consideration on the next revision of the rules.

Alleged Drunkenness.

A letter was considered from the Secretary of H.R.H. Princess Christian's Maternity Home as to the cases of two nurses, and the following resolution was passed:

That the Board considers that the Committee of H.R.H. Princess Christian's Maternity Home did their obvious duty in reporting the cases of alleged drunkenness in two of its nurses to the local supervising authority, but it also thinks that the committee of the Home will see that it is to their interest to reinforce their precautions in selecting two women to act as midwives in connection with the Home.

Advertisements.

A letter was considered from the Medical Officer of Health for Whitstable as to an advertisement issued by a certain nurse. The Board decided (1) that the nurse be requested to give an undertaking to withdraw the circular complained of, and to issue no more advertisements suggesting that she is qualified to give medical treatment, and that in default of an undertaking she be cited to appear before the Board; and (2) that the local supervising authority be asked to report on her conduct at the end of three months from this date.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

THE following appointments have been made at the Admiralty: Fleet Surgeon P. M. MAY, to the *Humbly*, on recommissioning January 6th; Fleet Surgeon G. G. SOLAKET and Staff Surgeon W. L. HOPKINS, to the *President*, for special service cruisers at Port-mouth, January 1st (Staff Surgeon Hopkin's appointment being temporary); Surgeon R. WILLAN, appointed to the *Betham*, on recommissioning undated; Surgeon C. W. JEFFREY, to the *Dorset*, additional, December 30th, 1908, and on recommissioning, undated.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

SURGEON-GENERAL W. B. SLACHTER is placed on retired pay, December 31st, 1908. He was appointed an Assistant Surgeon March 30th, 1872; Surgeon, March 1st, 1873; Surgeon-Major, March 30th, 1884; granted the rank of Lieutenant-Colonel, March 30th, 1892; made Brigade-Surgeon, July 6th, 1895; Colonel, April 1st, 1902; and Surgeon-General, June 1st, 1905. He has been Principal Medical Officer, Eastern District, Principal Medical Officer, 10th Division, 4th Army Corps; Administrative Medical Officer, Eastern Command; and Principal Medical Officer, Eastern Command, India. He served in the Alder war in 1870, receiving a medal and clasp in the campaign, the North-West Frontier of India in 1897-8, receiving a medal with clasp.

Colonel A. W. P. INMAN, M.B., half-pay, retires on retired pay, January 6th. His commissions bear date: Surgeon, March 6th, 1880; Surgeon-Major, June 6th, 1892; Lieutenant-Colonel, March 6th, 1895; and Colonel, July 22nd, 1905. He was placed on half-pay August 14th, 1907. He has been Physician and Surgeon Kilmarnock Hospital, and Principal Medical Officer, South China, but has no war record in the Army Lists.

Lieutenant-Colonel G. J. COATES, M.D., is placed on temporary half-pay on account of ill-health, December 29th, 1908.

Colonel O. TOMP, M.B., who is placed on half-pay, has been transferred from the North (Scout) Division to be Principal Medical Officer Bangalore and Southern Brigades, Madras, vice Colonel H. St. C. Carruthers, Indian Medical Service, transferred.

Major R. J. BLACKMAN, who is serving in India, is appointed Sanitary Officer, 1st (Feroz) Division.

Major J. C. WEIR, M.B., also serving in India, is appointed Sanitary Officer, 8th (Lucknow) Division.

Captain L. E. L. PARKER, also serving in India, Brigade Laboratory Brailly, is appointed Specialist in the Prevention of Disease.

INDIAN MEDICAL SERVICE.

COLONEL H. B. BRIGGS, M.B., Bombay, Principal Medical Officer, Kurrachee Brigade, is permitted to retire from the service, from January 1st. He joined the Bombay Medical Department as Assistant Surgeon, September 1876, and became Colonel July 10th, 1905. He was in the Burmese expedition in 1885-7, receiving a medal with clasp; he was also with the Tirah Expeditionary Force on the North-West Frontier of India, in 1897, and was mentioned in dispatches; *Harris Army List* credits him with a medal with two clasps for the latter campaign, but these are omitted in the *Official Quarterly*.

Colonel W. G. HENDERSON, Bombay, also retires from the service, from November 14th, 1908. He was appointed an Assistant Surgeon, March 31st, 1876, and was made Colonel, November 1st, 1905. He served in the Burmese campaign in 1887-8. Again the Army Lists differ, *Harris Army List* assigns him a mention in dispatches and a medal with clasp, but the *Official Quarterly Army List* record contains neither of these.

The retirement from the service, from November 15th, 1908, is also announced of Lieutenant-Colonel W. H. W. ELLIOT, M.B., D.S.O. Emerging the Bengal Medical Department as Assistant Surgeon, March 31st, 1876, he obtained the rank of Lieutenant-Colonel, March 31st, 1897. His war record is as follows: Hazara expedition, 1888 medal with clasp; first Maritz expedition, 1891, North-West Frontier of India, campaign, 1897-8 (use the clasp); South African War, 1899, 1901, including operations in Natal and action at Lombard Kop, the

defence of Ladysmith and action of January 6th, and subsequent operations in Natal and the Transvaal (mentioned in dispatches, appointed D.S.O. and granted the Queen's medal with three clasps).

Colonel W. O'HARA, Madras, is appointed Principal Medical Officer, North (Scout) Division, vice Colonel O. Todd, M.B., British Medical Service, transferred to the Brigade Staff.

Colonel H. ST. C. CARRUTHERS, Madras, to be Principal Medical Officer, Abbottabad and Sealcote Brigades, temporarily.

TERRITORIAL FORCE.

HONOURABLE ARTILLERY COMPANY.

Surgeon-Captain E. H. MYDDLETON-GAFFY, Infantry, to be Surgeon-Major, November 28th, 1908.

ROYAL FIELD ARTILLERY.

Surgeon-Captain A. THOMAS, from the 1st Cardigan Royal Garrison Artillery (Volunteers), to be Surgeon-Captain 2nd Welsh Brigade, with precedence as in the Volunteer Force, April 1st, 1908.

INFANTRY.

Surgeon-Lieutenant R. BLADWORTH, M.B., from the 2nd Volunteer Battalion the Prince of Wales's Own (West Yorkshire Regiment), to be Surgeon-Lieutenant 6th Battalion the Prince of Wales's Own (West Yorkshire Regiment), with precedence as in the Volunteer Force, April 1st, 1908.

ROYAL ARMY MEDICAL CORPS.

Second London General Hospital.—The following to be officers whose services will be available on mobilization, dated December 23rd, 1908: To be Lieutenant-Colonels: F. WALKER, M.D., F.R.C.S. Eng., H. H. LUTTON, F.R.C.S. Eng., S. J. SHARPEY, M.D., and G. H. MARINIS, C.B., F.R.C.S. Eng. To be Majors: W. H. WHITE, M.D., C. W. M. MOULLEN, M.D., F.R.C.S. Eng., T. D. ACAND, M.D., F.R.C.S. Eng., G. N. PRYDE, M.D., V. H. KATZEL, F.R.C.S. Eng., R. E. SELLW, M.D., and C. J. SYMONDS, M.D., F.R.C.S. Eng. To be Captains: H. P. HAWKINS, M.D., W. A. LANE, M.D., F.R.C.S. Eng., F. J. SMITH, M.D., F.R.C.S. Eng., C. A. BALLANCE, M.V.O., M.B., F.R.C.S. Eng., W. J. MADDY, M.D., F.R.C.S. Eng., E. R. LEN- WICK, F.R.C.S. Eng., H. W. G. MACKENZIE, M.D., L. A. DUNN, M.B., F.R.C.S. Eng., H. G. TURNER, M.D., F.R.C.S. Eng., J. HUTCHINSON, JUD., F.R.C.S. Eng., B. DAWSON, M.D., H. B. ROBINSON, M.D., F.R.C.S. Eng., H. HEAD, F.R.C.S. Eng., M. D. F. O'FAR, M.D., F.R.C.S. Eng., J. J. PERKINS, M.B., F.J. NEWBARD, F.R.C.S. Eng., W. S. COLEMAN, M.D., C. H. FAGEO, M.B., F.R.C.S. Eng., J. FAWCETT, M.D., F.R.C.S. Eng., and R. P. ROWLANDS, M.B., F.R.C.S. Eng.

First London General Hospital.—Surgeon-Major L. T. F. BRYET, M.D., from the 3rd Volunteer Battalion the Queen's Own (Royal West Kent Regiment), to be Major, with precedence as in the Volunteer Force, November 24th, 1908. C. E. GODDARD, M.D. (late Surgeon-Captain, 5th Middlesex Volunteer Regt., West Middlesex), to be Captain, November 24th, 1908. Surgeon-Captain A. R. OWST, from the 1st Cadet Battalion the Royal Fusiliers (City of London Regiment), to be Captain, with precedence as in the Volunteer Force, but next below Captain C. E. GODDARD in the unit, November 24th, 1908. R. H. B. GARTHEW, M.D., to be Lieutenant, November 24th, 1908. H. S. FRIEDLIN to be Lieutenant, November 24th, 1908.

Fifth Southern General Hospital.—Army Medical Corps.—Surgeon-Lieutenant Colonel J. H. ENGLISH, Surgeon Colonel EDWIN J. HOPKIN, from the 3rd (Duke of Connaught's Own) Volunteer Battalion Hampshire Regiment, to be Lieutenant-Colonel, with the honorary rank of Surgeon-Colonel, with precedence as in the Volunteer Force, April 1st, 1908.

Third Western General Hospital.—To be officers whose services will be available on mobilization: To be Lieutenant-Colonels—HERBERT R. VACHELL, M.D., THOMAS WALLIS, M.D., ERNEST L. C. LANCASTER, M.B., to be Major, November 24th, 1908. To be Captains: W. T. HARRIS, M.B., PHILIP R. GIFFITHS, M.B., WILLIAM M. STEVENS, M.D., CYRIL LEWIS, M.D., DONALD R. PATTERSON, M.D., BENJAMIN W. BROAD, M.K., ALFRED HOWELL, M.D., WILLIAM F. BROOK, F.R.C.S. Eng. To be Lieutenants: H. N. G. CORNELL, G. C. ELSWORTH, M.D., F.R.C.S. Eng., HAROLD A. SCHOLBERG, M.B., WILLIAM J. GREER, F.R.C.S. Eng., THOMAS M. THOMAS, M.D., F.R.C.S. Eng., WILLIAM NICHOLSON.

Fourth London General Hospital.—Surgeon-Major J. C. DUNN, to be Adjutant of a School of Instruction, November 21st, 1908.

Major A. MOYES, M.B., from the Scottish Command, Glasgow Companies, Royal Army Medical Corps (Volunteers), to be Major, with precedence as in the Volunteer Force, April 1st, 1908.

Major A. MOYES, M.B., resigns his commission, with permission to retain his rank, and to wear the prescribed uniform, November 12th, 1908.

For Attachment to Units other than Medical Units.—Captain G. GORDON, M.B., from the Scottish Command, Glasgow Companies, Royal Army Medical Corps (Volunteers), to be Captain, with precedence as in the Volunteer Force, April 1st, 1908; Surgeon-Captain J. L. GARDNER, M.D., from the 2nd Lancashire Royal Engineers (Volunteers), to be Captain, with precedence as in the Volunteer Force, April 1st, 1908; R. J. INDSAY, late 1st (Inverness-shire Highland) Volunteer Battalion the Queen's Own Cameron Highlanders, to be Captain, April 1st, 1908; Major A. G. ALLEN, M.B., F.R.C.S. Eng., to be Lieutenant, November 17th, 1908; Surgeon-Lieutenant A. T. MULLALL, from the 7th Battalion the Sherwood Foresters (Nottinghamshire and Derbyshire Regiment), to be Lieutenant, with precedence as from December 15th, 1908. November 15th, 1908.

Third London Field Ambulance.—Major A. A. ROSS, M.B., to be Lieutenant-Colonel, August 15th, 1908; Lieutenant D. G. DAVIDSON to be Lieutenant, August 15th, 1908.

Third Northern General Hospital.—The following to be officers whose services will be available on mobilization, January 2nd, 1909: To be Lieutenant-Colonels: W. DYSON, M.D., R. J. FITE-SMITH, M.D., D. BRIDGES, M.B., and S. D. ELLIOT, M.D., F.R.C.S. Eng. To be Majors: W. N. PORTER, M.D., A. HALL, M.D., H. LOCKWOOD, W. T. LOCKING, M.D., G. WILKINSON, M.B., F.R.C.S. Eng., and A. E. NAISS, M.B., to be Captains: A. YOUNG, M.B., A. R. HALLAM, M.D., S. RUSSELL, M.D., J. W. G. GUY, M.D., G. S. SIMPSON, F.R.C.S. Eng., and A. G. WILSON, M.B., F.R.C.S. Eng.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 7,765 births and 5,668 deaths were registered during the week ending Saturday last, January 2nd. The annual rate of mortality in these towns, which had been 15.5, 15.3, and 1.8 per 1,000 in the three preceding weeks, rose again last week to 18.2 per 1,000. The rates in the several towns ranged from 6.5 in King's Norton, 7.7 in Hastings, 9.1 in York, 9.6 in Bournemouth, 9.9 in Leyton, 10.2 in East Ham, and 10.3 in Willesden, to 22.4 in West Bromwich and in Swansea, 22.6 in Manchester, 23.3 in Wigan, 23.4 in Oldham, 23.5 in Liverpool, 24.1 in Sunderland, 25.1 in Coventry, and 30.4 in Middlesbrough. In London the rate of mortality was 19.6 per 1,000, while it averaged 17.6 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.6 per 1,000 in the seventy-six towns, in London the rate was 1.5, and in the several towns it ranged from 1.7 per 1,000, while among the other large towns the rates ranged upwards to 2.5 in Tottenham, 2.8 in Manchester, 2.9 in Great Yarmouth and in Rochdale, 4.0 in Middlesbrough, 4.1 in West Ham, and 6.9 in Leicester. Measles caused a death-rate of 1.1 in Manchester, in Oldham, and in Huddersfield, 1.2 in Blackburn, 1.6 in Rotherham, 1.7 in Croydon and in Tottenham, 2.4 in Great Yarmouth and in Rochdale, 3.0 in West Ham and in Middlesbrough, and 6.3 in Leicester; diphtheria of 1.1 in East Ham and in Middlesbrough, 1.3 in King's Norton and in Birkenhead, and 1.9 in Devonport; whooping-cough of 1.1 in Swansea and 1.5 in Wolverhampton; "fever" of 1.5 in Warrington; and diarrhoea of 1.6 in Walsall. The mortality from scarlet fever

showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The Metropolitan Asylums Hospitals and the London Fever Hospital contained 4,557 scarlet fever patients at the end of the week, against 3,707, 3,537, and 3,583 at the end of the three preceding weeks; 379 new cases were admitted during the week, against 426, 381, and 303 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

During the week ending Saturday last, January 2nd, 880 births and 622 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 15.2, 16.6, and 16.1 per 1,000 in the three preceding weeks, rose again to 17.4 per 1,000 last week, but was 0.8 per 1,000 below the mean rate during the same period in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 14.6 in Aberdeen and in Leith, and 15.4 in Edinburgh, to 18.8 in Greenock and 19.7 in Dundee. The death-rate from the principal infectious diseases averaged 1.7 per 1,000 in these Scottish towns, the highest rate being recorded in Dundee and Paisley. The 393 deaths registered in Glasgow included 3 which were referred to diphtheria, 20 to whooping-cough, 2 to cerebro-spinal meningitis, and 9 to diarrhoea. Two fatal cases of whooping-cough and 2 of diarrhoea were recorded in Edinburgh; 2 of scarlet fever and 6 of diarrhoea in Dundee; 3 of diphtheria and 2 of diarrhoea in Paisley; and 2 of diarrhoea in Aberdeen.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, December 26th, 1908, 391 births and 397 deaths were registered in the twenty-two principal urban districts of Ireland, as against 543 births and 418 deaths in the preceding period. The annual death-rate in these districts, which had been 20.5, 19.7, and 19.3 per 1,000 in the three preceding weeks, fell to 18.3 per 1,000 in the week under notice, this figure being 5.5 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 17.2 and 23.4 respectively, those in other districts ranging from 4.0 in Dundalk and 4.7 in Wexford to 27.5 both in Limerick and Lisburn, while Cork stood at 11.6, Londonderry at 12.2, and Waterford at 17.5. The zymotic death-rate in the twenty-two districts averaged 0.7 per 1,000 as against 1.1 per 1,000 in the preceding period.

During the week ending Saturday, January 2nd, 720 births and 537 deaths were registered in the twenty-two principal urban districts of Ireland, as against 391 births and 397 deaths in the preceding period. The annual death-rate in these districts, which had been 19.7, 19.3, and 18.3 per 1,000 in the three preceding weeks, rose to 24.7 per 1,000 in the week under notice, this figure being 6.5 per 1,000 higher than the mean annual death rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 23.3 and 21.4 respectively, those in other districts ranging from 12.3 in Drogheda and 13.2 in Queenstown to 35.9 in Clonmel and 41.3 in Portadown, while Cork stood at 28.1, Londonderry at 20.7, Limerick at 27.3, and Waterford at 28.1. The zymotic death-rate in the twenty-two districts averaged 1.1 per 1,000, as against 0.7 per 1,000 in the preceding period.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

THE British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the **BRITISH MEDICAL JOURNAL** is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association, and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the **BRITISH MEDICAL JOURNAL** for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

ORGANIZATION COMMITTEE.

REPORT

ON

LEGAL QUESTIONS AS TO OPPOSITION BY BRANCHES TO CERTAIN CLAUSES OF DRAFT CHARTER.

THE Organization Committee Reports to the Divisions and Branches:

That an application has been received from the Metropolitan Counties Branch for advice upon the legal questions involved in a point of order raised at a meeting of that Branch, and that the Committee has, upon the advice of the Solicitor, taken Counsel's opinion on the matter.

Having regard to the important bearing of the Opinion received from Counsel on questions now pending, the Committee has resolved that it, together with the Statement of Case submitted, should at once be Reported through the JOURNAL to the Divisions and Branches. The Statement of Case and Opinion are as follows:

CASE TO COUNSEL TO ADVISE.

COUNSEL will receive herewith the following documents:

1. Print of Memorandum, Articles, and By-laws of the British Medical Association.
2. Print of Petition to His Majesty's Privy Council for Grant of a Royal Charter.
3. Print of Draft Charter Ordinances and By-laws submitted with the Petition.
4. Print of Model Rules of Branches and Divisions.
5. Correspondence in the BRITISH MEDICAL JOURNAL relative to the Charter.

The Petition of the British Medical Association to His Majesty's Privy Council for the Grant of a Royal Charter was lodged on December 21st, 1908, and it was accompanied by a Print of the Draft Charter Ordinances and By-laws.

A Print of each of these documents accompanies for Counsel's information and reference.

There has within the Association recently arisen amongst certain of its Members a spirit of opposition to some of the provisions contained in the Ordinances appended to and referred to in the Draft Charter, and this movement which was originated in the South-Western Branch of the Association has extended to and affected other Branches and Divisions. In fact at the present time certain of the Branches are circularizing their Members in view of ascertaining the individual feeling which prevails concerning the matters referred to, and it is also suggested that certain of the Branches as units of the Association shall, either individually as a Branch, or in combination with other Branches, petition the Privy Council in opposition to the grant of the Charter in the form in which it is presented.

As accompanying this case, a Copy of the correspondence which has appeared upon the subject is sent, and which will serve to show Counsel how and the circumstances under which the movement was started, and the manner in which it has extended.

The short points involved, and upon which Counsel's opinion is desired, are:

- (a) Whether such action on the part of the Branches or Divisions is, in the circumstances which prevail, within their powers or is *ultra vires*;
- (b) If *ultra vires*, then what means are open to be taken by the Association to put a stop to it, and
- (c) Whether the expenditure incurred consequent upon the action of the Branches and Divisions referred to is legitimately chargeable to the funds of the Association or Association by being defrayed out of Division or Branch funds.

The facts incident to and the relative aspects of the matter are more fully detailed in a letter received from

the Medical Secretary of the Association, and of which, omitting formal parts, the following is a copy:

The President of a Branch of the Association has applied for a legal opinion arising out of a point of order put to him at a recent General Meeting of his Branch over which he presided.

The question before the meeting was, whether the Council of the Branch should be instructed to co-operate with other Branches in petitioning the Privy Council for an amendment of certain of the Ordinances of the Charter as submitted to the Privy Council by the Council of the Association in accordance with the instructions of the Representative Meeting.

The point of order, of which the President had not had notice prior to the meeting, and which he therefore felt unable to decide on his own responsibility, was that the proposed action would be outside the functions of a Branch Council as defined by the present Articles and By-laws of the Association; that it would, therefore, be *ultra vires* for the Branch Council to take the action proposed, and consequently was out of order for a General Meeting of the Branch to consider any proposal for instructing them so to do.

The President of the Branch, as Chairman of the Meeting, declined to give any ruling, and decided that the meeting should proceed, promising that, if the resolution were carried, no action should be taken thereunder until a legal opinion had been obtained.

Though the resolution was not carried the point raised appears to him to be one of such importance that, in the interests of the Association, the correct view of the matter should be ascertained and made known to the Association generally.

The question at issue, as stated by the President of the Branch in his letter to the Chairman of the Organization Committee, is as follows:

Can a Branch of the Association act as a corporate body in opposition to a constitutionally pronounced decision of the Association?

As illustrating the kind of action in question, I am to refer you to the reports published in the *BRITISH MEDICAL JOURNAL* (copies of which I enclose), the first relative to a circular issued by the Council of the South-Western Branch to members of that Branch (*BRITISH MEDICAL JOURNAL*, November 21st, page 1588); the second relative to action by the Council of the Midland Branch (*BRITISH MEDICAL JOURNAL*, January 2nd, page 61).

The Chairman of the Organization Committee has directed that this point shall be submitted to you for Counsel's opinion.

As regards the question submitted, some explanation may be of assistance to you of the views taken of the position by those who have asked that it should be decided.

The Divisions and Branches of the Association are local units of the members created by Article IV of the Articles of Association, and having certain powers and duties stated in the Regulations of the Association.

As you are aware, the Divisions and Branches are so constituted as to include, respectively, in their membership every member residing within the area of each.

It therefore follows that, speaking generally, every member of the Association is at the same time a member of some Division of the Association, and a member of some Branch, and he has rights and obligations in a threefold capacity.

- (a) As an individual member of the Association;
- (b) As a member of a local unit, the Division, and
- (c) As a member of a local unit, the Branch.

As you are aware, Divisions and Branches have certain powers of autonomy, including that of adopting Rules for their own government limited by two conditions, *first*, that any Rules they adopt must be in accordance with the Articles and By-laws of the

Association; and, *secondly*, that they must be subject to the approval of the Central Council.

The sets of Model Rules of Divisions and Branches respectively, which I enclose, illustrate the view which has been taken of the kind of local regulations which are permitted by the Council to be adopted.

Divisions and Branches have a certain direct representation in the governing bodies of the Association, namely:—every Division, alone or in conjunction with some other Division, is entitled once a year to elect a Representative to take part in Representative Meetings, and who must be elected in a General Meeting of the Constituency which he is to represent.

The Branches, singly or in groups, elect members of the Central Council of the Association. The respective powers of the Representative Meeting and Council thus elected are defined in the Regulations of the Association.

For the present purpose attention may perhaps be specially drawn to Article XXXV, in which it is declared that a resolution of the Representative Meeting, passed subject to certain specified conditions, "shall be deemed to be a decision of the Association." One of the conditions is that such a resolution before becoming binding must be confirmed either by the Council, or by the Division upon a Referendum taken by the Council.

In the present instance the question concerns opposition by Branches to action taken on behalf of the Association by the Council under instructions from the Annual Representative Meeting.

You are aware that at the Annual Representative Meeting it was decided by a majority of 106 to 1 to direct the Council to apply for a Charter in the form approved by that meeting.

The Council considered this among other resolutions of the Representative Meeting immediately afterwards, with a view to deciding whether they should be approved, or whether a Referendum should be taken upon any of them, and the Council approved the resolution in question "nemine contradicente."

The duty of seeing that the necessary amendments decided upon by the Representative Meeting were incorporated in the Charter was referred by the Council to the Organization Committee, and this having been duly carried out the document in its finally amended form was again submitted to the Council, who, again "nemine contradicente," appointed its Chairman, Mr. Edmund Owen, and the Chairman of the Organization Committee, Mr. Andrew Clark, as a Committee to take all necessary steps to submit to the Privy Council a Petition, in a form then approved by the Council, for a Charter in a form at the same time approved.

You are also aware of the history of the repeated examination and amendments by the Divisions and Representative Meeting, which the draft Charter has undergone in the three years ending August, 1908.

The relevance of this to the point at issue will be mentioned immediately.

Those who have raised the question submit that in the above stages of consideration and decision as to the Charter, the Divisions of the Association through the Representative Meeting, and the Branches of the Association through their representatives on the Council, have been afforded their proper constitutional opportunities of making known their views as to the Charter, and that the resolution of the Representative Meeting at Sheffield, confirmed by the Council, constitutes in all respects a decision of the Association against which it is not competent for Divisions and Branches, as units of the Association, to take any corporate action.

The above considerations relate to the power of Divisions and Branches to take corporate action.

The question will also obviously arise, if such action should be held to be *ultra vires*, as to what means the Association possesses of restraining its Divisions and Branches from taking such illegal action apart from the financial aspects of the matter.

On the financial aspects of the position the Chairman of the Organization Committee thinks it well that the present opportunity should be taken of having considered and being advised upon the cognate question, which had previously been raised, as to whether Branches have power to expend the funds of the Association on such action as circularizing all members of a Branch to ascertain whether, in their view, the Branch Council should petition the Privy Council in opposition to the grant of the Charter which the Association have applied for in its present form.

I enclose a copy of a circular issued by a Branch Council for this purpose (see JOURNAL, November 21st, p. 1588.)

It is possibly relevant to the question of the propriety of such action to draw attention to the fact that the considerations placed before the members of the Branch by this circular relate entirely to one side of the matter. No attempt is made to state the arguments either against the mode of taking a Referendum proposed, nor as to the propriety of the question being raised at the present juncture by way of petition to the Privy Council.

Prints of the Model Rules referred to in the foregoing letter accompany, and are fastened together as one document.

The passages in the issues of the BRITISH MEDICAL JOURNAL of November 21st (p. 1588), and January 2nd (p. 61) to which the Medical Secretary refers will be found in the copy correspondence extracted from the JOURNAL which accompanies.

Counsel is required to advise the British Medical Association upon the points which are involved and generally for their assistance.

COUNSEL'S OPINION.

The resolution to approve the draft of the Charter Ordinances and By-laws in its present form, which was passed at Sheffield by the Representative Meeting, and afterwards approved by the Council is "a decision of the Association" within the 35th Article of Association, and is binding on all Branches and Divisions. It is in pursuance of that resolution, so approved, that the draft of the Charter Ordinances and By-laws has been submitted to the Privy Council.

Under these circumstances, no Branch or Division can, in my opinion, legally petition the Privy Council against granting the Charter (with the Ordinances and By-laws) in the form submitted or take any other steps directed towards interfering with such grant. The powers of a Branch or Division are limited to regulating its own internal affairs and carrying out, within its own limits, the defined objects of the Association (see Article V and By-laws 11, 12, 16). It is bound to conform to the regulations of the Association (including Article XXV), and it cannot legally act in opposition to a decision of the Representative Meeting. It would be subversive of all internal discipline and cohesion, and would lead to anarchy if such action were permissible.

It follows that a Branch or Division cannot apply the funds of the Association granted to it under By-law 16 (for the purposes therein mentioned) in promoting a Petition to the Privy Council or in obtaining the opinion of its members as to whether such a petition shall be presented. And if the funds of the Association are so applied the individuals so applying them could, in my opinion, be made personally responsible for their misapplication. And any person threatening so to apply them could be restrained by injunction.

I may add (though this observation does not affect the legal position above explained) that there does not appear to me to be any legitimate grievance as to the form in which

the provisions of the draft Ordinances as to the Referendum now stand. The question of their form was the subject of a particular resolution at the Sheffield Meeting, and (as I am informed) full public notice of the terms of that resolution was given previously to that meeting; the Divisions, therefore, had ample opportunity of considering the proposed resolution and of voting against it at that meeting by their Representatives. The objections now raised come too late.

(Signed) T. R. COLQUHOUN DILL,

Lincolnc, Inn,

11th January, 1909.

FORMATION OF A BUCKS DIVISION.

A most successful and interesting meeting was held at Aylesbury on December 1st, 1908, to consider the formation of this Division. Twenty-six medical men were present, and had the weather been more favourable several more would have attended. All the practitioners in Aylesbury except one put in an appearance, and he was away from home. Several came from long distances, the train service to Aylesbury being very convenient. Those present were Drs. Baker, Carruthers, Parrott, Perrin, Rose, Shaw, and West (Aylesbury), A. T. Morrison (Waddesdon), H. E. Crawley (Wendover), E. O. Turner and H. G. Magrath (Great Missenden), F. O. Cooke and R. O. Lee (Haddenham), J. W. Graham (Brill), P. L. Benson (Steeple Claydon), W. L. Bradshaw (High Wycombe), J. C. Gardner and R. R. Hardwicke (Amersham), Colonel P. B. Giles, F.R.C.S. (Bletchley), Drs. Deyns and Bradbrook (Fenny Stratford), A. E. Larking (Buckingham), J. Durran (Leighton Buzzard). Expressions of regret at absence were received from Drs. Howard and Pemberton (Buckingham), Nicholson and Buxton (Fenny Stratford), Wickham (Newport Pagnell), Smith-Wynne (Amersham), Johnstone Harris (Leighton Buzzard), and Reynolds (High Wycombe). Mr. ANDREW CLARK took the chair, and in his opening remarks referred to the satisfactory progress of the Association and the advantages of having an active Division in the county.

Mr. SMITH WHITAKER then gave an address on the Work and Methods of the British Medical Association. It was listened to with great interest by those present, applause being frequent and enthusiastic, especially when he referred to the many cases in which medical men had been successful, by local united action supported by the Association, in resisting unreasonable demands made upon them, including underpayment. He deprecated the prejudices, suspicions, and jealousies existing among medical practitioners in the same neighbourhood, which often prevented such united action, and could only be overcome by encouraging practitioners to meet, which was one of the chief functions of the Divisions. Dealing at some length with the question of medical inspection of schools, he instanced the share the British Medical Association had in formulating a scheme. On the question whether the work of inspection should be carried out by part-time officers or whole-time officers, the preponderating opinion of the Divisions was in favour of whole-time officers, because it was feared that if private practitioners did the work there would be greater risk of friction through "interference" with the patients of other practitioners. Questions as to treatment of children found defective were now coming up for consideration, and if it was desired that this work should be allotted to private practitioners, it rested with the Divisions to devise schemes which would be satisfactory to local authorities as providing for the work being done as efficiently and as economically as by whole-time public officers. After referring to many instances of the value of national combination of the profession through the Association, as with regard to legislation and prosecution of unqualified practitioners, he closed a most eloquent and lucid address.

Colonel GILES, F.R.C.S., then proposed—"That this meeting pledges itself to do its utmost to promote the formation of a Bucks Division of the British Medical Association." His firm opinion was that more of the methods of the trades union should be adopted by the

British Medical Association and the interests of the general practitioners be protected. The new Inspection of School Children's Act was quite capable of being carried out by general practitioners if there was a central medical man to collate the results.

Dr. BAKER seconded, and urged that the present opportunity should not be lost, and that a Division be formed. If they all tried to help the Association, they would find it gave them great help in return.

Dr. BRADBROOK, in a witty speech, proposed:

That a committee be elected to carry out the necessary preliminary arrangements, and that a meeting be called in the early part of the new year to elect officers, draw up rules and regulations, and put the Division in working order.

He also thought that a more active policy should be pursued, and that the question of clubs should be dealt with in a drastic manner by insisting upon better remuneration. Dr. GRAHAM seconded the resolution, and made a few remarks on the new inspection of school children which he thought was not at all satisfactorily carried out. This resolution was carried unanimously.

Formation of Committee.—A committee consisting of Drs. Baker, West, Turner, Graham, Gardner, Bradbrook, Durran, Larking, Benson, and Reynolds was proposed by Dr. LARKING and seconded by Dr. SHAW. Tea was then provided by Dr. and Mrs. Baker.

Address.—Mr. JAMES BERRY, of London, gave a very practical and much appreciated address on "Miscellaneous Points in Surgical Practice."

The meeting then terminated.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

CAPE OF GOOD HOPE—WESTERN PROVINCE BRANCH.

ANNUAL MEETING.

The annual meeting of the Branch was held on November 30th, 1908. Dr. ELLIOTT, President, in the chair; twenty-four members attended.

Reports.—The reports of Council, Treasurer, Political and Library Committees were read and adopted.

Vote of Thanks to Honorary Librarian.—A special vote of thanks was passed to Dr. Hugh Smith, Honorary Librarian.

Election of Office-bearers.—The following were elected office-bearers for 1909: *President*, Dr. Jasper Anderson (Capetown); *Vice-President*, Dr. G. Eyre (Claremont); *Treasurer*, Dr. J. H. de Villiers (Rondebosch); *Secretary*, Dr. H. A. Moffat (Capetown); *Council*, Dr. Bachelor (Sea Point), Dr. C. C. Elliott (Sea Point), Dr. S. W. F. Richardson (Capetown), Dr. Hugh Smith (Capetown).

Vote of Thanks to Retiring President.—Dr. JASPER ANDERSON moved a hearty vote of thanks to the President for 1908, Dr. C. C. Elliott. This was carried by acclamation.

SPECIAL MEETING.

After the annual meeting a special meeting was held.

Proposed Formation of a South African Committee.—The report of delegates to a meeting at East London with delegates from other Branches re the formation of a South African Committee was adopted.

Government Sick Funds.—A recommendation from the Medico-Political Committee was adopted as follows, referring to Government sick funds:

That this meeting considers that all officials whose salaries are above a maximum to be fixed should not be entitled to the gratuitous services of medical officers to sick funds.

Filler President and the Chairman of the Medico-Political Committee were elected a deputation to interview the **Commissioner of the Cape Government Railway Sick Fund.**

Annual Dinner.—The annual dinner was held on December 11th, and passed off very successfully. There were forty-four present. The Hon. J. X. Merriman, Prime Minister, and the Hon. H. Burton, Attorney-General, were present.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

GLOUCESTERSHIRE BRANCH.—A general meeting of the Branch will be held at the General Hospital, Cheltenham, on Thursday, January 21st, 1909, at 7 p.m. Agenda: 1. Minutes of last meeting. 2. Dr. A. F. R. Conder: Notes on a case of pneumococcal infection. 3. Dr. E. A. Dent: Paper—Rheumatoid Arthritis, its Clinical Aspects, Diagnosis, and Treatment (with photograph). There will be a supper afterwards at the Cosy Corner, Promenade (tickets 5s. 6d. each, exclusive of wine). The Secretary will be pleased to hear from any member who will show cases or pathological specimens at future meetings during this session.—D. E. FINLAY, Honorary Secretary, Gloucester.

LANCASHIRE AND CHESHIRE BRANCH.—Several Divisions have asked the Branch Secretary to assist them in drawing up a clinical and scientific programme for their winter meetings by letting them know of gentlemen who would be willing to read papers or give demonstrations at meetings of Divisions other than their own. The Honorary Secretary would accordingly be pleased to know of any members willing to give such papers or demonstrations, so that he may be able to submit them to the Divisions.—F. CHARLES LARKIN, Branch Secretary, Liverpool.

LANCASHIRE AND CHESHIRE BRANCH: LEIGH DIVISION.—A meeting will be held in the Co-operative Offices, Ellesmere Street, on Thursday, January 21st, at 8.30 p.m. Agenda: 1. Minutes. 2. Report on medical inspection of school children. 3. Earlier appointment of Representative. 4. Nationalization of medicine. 5. Any other matter.—G. H. SHAW, Honorary Secretary, Burnleigh, Leigh, Lancs.

METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.—There will be a meeting of the Kensington Division, at the Kensington Town Hall, on Thursday, January 21st, at 5 p.m., when Mr. L. A. Bidwell will give an address on the immediate and ultimate results of gastro-enterostomy for gastric and duodenal ulcer.—H. BECKETT OVERY, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: HAMPSHIRE DIVISION.—A special and ordinary meeting of this Division will be held on Tuesday, January 26th, 1909, at 4.55 p.m. and 5 p.m., at St. Peter's Hall, Belsize Square, N.W. (behind St. Peter's Church). Dr. Oppenheimer in the chair. Agenda (*Special Meeting*, 4.55 p.m.): 1. To alter Divisional Rule No. 7 in accordance with the existing Article xvii of the Association, so as to permit of the election of the Representative to the Representative Meeting "not more than 9 months nor less than 3 weeks before the Annual Representative Meeting," instead of "not more than 12 months nor less than 3 weeks before the Annual Representative Meeting," as in the former Article xvii of the Association. The Honorary Secretary will read a letter from the Medical Secretary on the subject. Agenda (*Ordinary Meeting*, 5 p.m.): 1. Minutes. 2. Letters. 3. Questions. 4. Report of Representatives on the Branch Council. 5. Annual report to the Branch (including financial report). 6. Hampshire Hospital business; to consider a letter from the Hospitals Committee of the Association. 7. To consider the questions submitted to Divisions on p. 11 of the Medico-Political Committee's report on the medical inspection of school children and the treatment of those found defective (see BRITISH MEDICAL JOURNAL of December 26th, 1908, pp. 1869 to 1874, and January 9th, 1909, pp. 96 to 102, and pp. 107 and 108). 8. Other business.—R. A. YELD, Honorary Secretary, Hampstead.

METROPOLITAN COUNTIES BRANCH: RICHMOND DIVISION.—A special meeting will be held on January 27th at 8.30 p.m. at the Bridge House Café, Richmond Bridge, to consider the Report on the Medical Inspection of School Children.—G. CARDNO STILL, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER DIVISION.—A special meeting of this Division will be held on Thursday, January 21st, at the Florence Restaurant, Rupert Street, near Piccadilly Circus, to consider the Report of the Medico-Political Committee on the Treatment of School Children. The meeting will be preceded by a dinner at 7.30. Any member of the profession desiring to attend the dinner is requested to communicate with one of the undersigned. Those unable to attend the dinner will be equally welcome at the business meeting afterwards, which will begin at 9 p.m.—HARVEY HILLIARD and J. HOWELL EVANS, Honorary Secretaries.

SOUTH-EASTERN BRANCH: BRIGHTON, HASTINGS, SEVENOAKS, AND TUNBRIDGE WELLS DIVISIONS.—A conjoint meeting of the Brighton, Hastings, Sevenoaks, and Tunbridge Wells Divisions will be held on Wednesday, January 20th, 1909, at the General Hospital, Tunbridge Wells (by kind permission of the House Committee). The chair will be taken by Dr. Adeney at 5 o'clock. Tea and coffee will be provided by the Chairman at 4.30 p.m. Two papers will be given on "Conditions of Septicæmia and their Bacteriological Treatment," with lantern demonstration. Mr. G. Bellingham Smith, M.B., Assistant Obstetric Physician to Guy's Hospital, will treat of the clinical aspect, and Dr.

J. W. H. Eyre, Bacteriologist to Guy's Hospital, of the bacteriological treatment. Dinner will be served at 7 p.m., at the Calverley Hotel, Tunbridge Wells. Charge, 6s., exclusive of wine.—G. R. MARSH (Brighton), G. VICKERMAN HEWLAND (Hastings), ISAAC NEWTON (Sevenoaks), E. A. STARLING, W. B. WARDE (Tunbridge Wells).

SOUTH MIDLAND BRANCH; NORTHAMPTONSHIRE DIVISION.—A meeting of the Division will be held in the Board Room of the Northampton General Hospital on Tuesday, January 26th, at 2.30 p.m. Business: Minutes. Annual report of Representative of Division. Revision of Divisional rules. Medical inspection of school children. Paper on the results of radical operations for uterine cancer by Thomas Wilson, M.D., F.R.C.S., of Birmingham.—PEYERELL S. HICHENS, Honorary Secretary, Northampton.

ULSTER BRANCH.—The winter meeting of this Branch will be held in Belfast on Wednesday, February 3rd. Members having communications are requested to send particulars not later than January 23rd to CECIL SHAW, M.D., Honorary Secretary, Belfast.

DEPARTMENTAL COMMITTEE ON THE OPERATION OF THE LAW RELATING TO INEBRIATES AND THEIR DETENTION IN REFORMATORIES AND RETREATS.*

On April 24th, 1908, the Home Secretary appointed a Committee on the Inebriates Acts. The Committee consisted of: Sir John Dickson-Poynder, Bart., M.P.; Mr. W. Ryland Adkins, M.P.; Dr. T. A. Bramson, M.P.; Dr. R. W. Branthwaite, H.M. Inspector under the Inebriates Acts; Mr. W. C. Bridgeman, M.P.; Dr. H. E. Bruce Porter; Dr. H. B. Donkin, one of H.M. Commissioners of Prisons; Dr. C. A. Mercier, Physician for Mental Diseases to Charing Cross Hospital; and Mr. J. Rose, Metropolitan Police Magistrate.

The original reference to the Committee was:

To inquire into the operation of the law relating to inebriates, and to their detention in reformatories and retreats, and to report what amendments in the law and its administration are desirable.

This original reference was, on August 7th, 1908, extended so as to authorize the Committee

To investigate the value of existing methods for the treatment of inebriety by the use of drugs.

With regard to the first reference, the Committee took evidence and members visited representative institutions of each class now existing for the control of inebriates. A set of questions bearing on the most important points was distributed to persons known to have practical or scientific knowledge of the matter. The Committee also considered the report of the Royal Commission on the Feeble-minded, the reports of the Inspector under the Inebriates Acts, and those of previous committees. The Committee interpreted this reference as applying to England and Wales only, the Secretary for Scotland having appointed a Departmental Committee to inquire into the working of the Acts in Scotland, but it also heard the evidence of the Inspector under the Acts in Ireland, and, though it makes no specific recommendations as to Ireland, it anticipates that its general recommendations will be considered by the Irish Office.

DEFINITION OF INEBRIATE.

The Committee recommends that an Act should be passed consolidating, amending, and extending the law relating to inebriates, and suggests that in this Act the term "Inebriate" be substituted for that of "Habitual Drunkard," and be defined as follows:

"An inebriate is a person who habitually takes or uses any intoxicating thing or things, and while under the influence of such thing or things, or in consequence of the effects thereof is—

"(a) Dangerous to himself or others; or

"(b) A cause of harm or serious annoyance to his family or others; or

"(c) Incapable of managing himself or his affairs, or of ordinary proper conduct."

London: Wyman and Sons; Edinburgh: Oliver and Boyd; Dublin: Ponsonby. To be obtained through any bookseller. Price 4½d. Minutes of Evidence, price 2s.

TREATMENT BY DRUGS.

With regard to this subject the Committee reports as follows:

iii. Our inquiry into the working of the Inebriates Acts led us to the very definite opinion that further powers and facilities, for the detention of inebriates, are urgently needed; but, at this stage, we were confronted by the possibility that some method of treatment of inebriety by means of drugs might be alleged to be a practicable alternative to detention; and, as any recommendations that we might make, as to further powers and facilities for detention would require the expenditure of public money, we felt that such recommendations should not be made until the possibility of this alternative had been considered.

Therefore, although we were impressed with the inherent improbability that any treatment by drugs could be enforced by Act of Parliament, we requested that the second reference might be issued to us before the termination of our inquiry into the first.

iv. This we did in order that we might be able to express an opinion on the question how far any special system of treatment of inebriety by drugs might be applicable to such persons as come within the operation of the Inebriates Acts.

The reasons why it appeared to us inherently improbable that any treatment by drugs could be enforced by Act of Parliament were as follows:

(1) It would be impracticable to set forth in an Act of Parliament the various modifications of any specific treatment that must be required by the varying needs of individual cases.

(2) The fate of the Vaccination Acts makes it evident that no mode of medical treatment can be successfully enforced by Act of Parliament, and that any attempt to enforce it would produce more friction, discontent, and agitation than it was worth.

(3) It would not be justifiable to enforce upon the voluntary inmates of Retreats a specific mode of treatment to which they might object. It must always be remembered that no regulation prevents the medical officers of institutions for inebriates from adopting any mode of treatment they think appropriate. Indeed, one of the modes which has been submitted to us is actually in exclusive use in an officially licensed Retreat at the present time.

(4) If a mode of treatment by drugs could be prescribed by Act of Parliament for inebriate offenders, this treatment must, in our opinion, be carried out in one of two ways.

(a) The treatment might be administered while the inebriate was under detention. In this case the authorities of Reformatories would be tied down to some specific treatment, instead of being free, as at present, to carry out any method that they think appropriate.

(b) If the inebriate were not detained, it would be necessary to take his recognizances to come up for treatment so many times a day for a specified period, or until the proper authority considered him cured. We think the administrative difficulties in the way of this procedure would be considerable, and its novelty might excite prejudice against it.

v. Improbable as it appeared that any mode of treatment by means of drugs would possess such features as would warrant its incorporation, if incorporation were possible, in a Statute, we thought it right to communicate with the advocates of the several drug treatments, and ask them to send us a full statement of the evidence they desired to submit. Our request was generally complied with; and we have carefully considered the statements sent in answer to it.

All persons, on whom these drug treatments have been tried, have voluntarily submitted themselves for treatment; and therefore, presumably, desired to be cured. These are, admittedly, the most favourable cases for treatment; and, concerning the residue of cases, in which the inebriate has no desire to abandon his habit, the reports sent to us do not afford any evidence. None of the methods finds every case that applies for treatment curable, and by no method can curable cases be distinguished from

incurable before trial of the remedy. There is nothing in the information supplied to us which would justify us in modifying our opinion.

vi. We have not investigated the efficacy, or the comparative merits, of these modes of treatment as curative of inebriety. Moreover, no conclusions arrived at by such an inquiry could, for the reasons stated in Paras. iv. and v., in any respect affect our recommendations as to the need for the continuance of the principle of detention under the Inebriates Acts. To embark upon a full inquiry into the efficacy and comparative merits of treatments for inebriety, by the use of drugs of secret composition and obscure action, would involve a great expenditure of time and money. Such an expenditure could only be justified by a strong expression of public opinion as to the necessity of such an inquiry. A procedure of this kind, moreover, would doubtless induce other persons, who put forward kindred remedies for other maladies, to quote it as a precedent to further expenditure of public time and money, in making investigations into the efficacy and comparative merits of their various methods of treatment. We are therefore of opinion that no good purpose could be served by making a further or more extended investigation into the value of existing methods for the treatment of inebriety by the use of drugs.

vii. We desire to call attention to the fact that treatment by drugs cannot possibly supply the penal element which is present in all sentences of inebriates to Reformatories.

viii. The amendments which, on the facts placed before us, we recommend in the Inebriates Acts, are of the utmost urgency; and we are unanimously of opinion that legislation embodying these amendments should be introduced at the earliest possible moment.

THE NATURE OF INEBRIETY.

The Committee, in an introductory section, gives some general observations on the nature of inebriety, for which, it is stated, it is indebted to the medical members, the observations being provided from their scientific knowledge and experience in the subject. This introduction contains the following passages:

There is no general consensus on the nature of inebriety. Some regard it as an exaggeration of ordinary self-indulgent drunkenness, and therefore a vice, which should be dealt with by punishment alone. Others consider it a disease allied to insanity, to be treated by medical measures, and not by punishment. The two views are irreconcilable, and it is manifest that, before any mode of dealing with inebriates is determined upon, it is desirable to ascertain whether either of these views is correct, and to approach this problem through the avenue of propositions that are universally, or at least generally accepted, such as the following:

A capacity for being pleasurably affected by the consumption of alcohol or some other intoxicant—opium, betel, kava, coca, kola, hashish, etc.—is a fundamental fact in human nature. It is common to nearly all human beings who have tried the effect of such drugs, and even to some of the lower animals.

Mankind in general seems to possess, in varying degree, this capacity for deriving enjoyment from the consumption of intoxicants.

No desire for the consumption of alcohol exists antecedent to actual trial of its use. Savage races, and civilized persons, who have never taken alcohol, have no desire for it whatever, however insatiate their craving for it may become when once they have indulged in it. Most persons now in civilized countries take some intoxicant, and most of them remain sober without effort. Some, however, get drunk from time to time. A smaller number are habitual drunkards.

In every person a certain quantity of alcohol will produce the familiar effects of intoxication. This quantity varies with the person and with the rapidity with which the alcohol is taken. The symptoms, also, vary with the person intoxicated, with the amount and kind of alcoholic liquor taken, and with the length of time over which its use is spread. In most people, the use of alcohol gives rise at length to satiety, and to temporary distaste for further indulgence. The quantity needed to produce this effect varies much in different persons. The important difference is that, in some persons, satiety is produced

before intoxication, and in others, intoxication is produced before satiety. Every person can be intoxicated, provided sufficient alcohol is taken; but there are many in whom satiety seems never to be reached.

If these propositions, on which it is unlikely that there will be any material difference of opinion, be granted, they lead to the following conclusions:

(1) That, when satiety is produced before intoxication, the person so affected is in no danger of becoming intoxicated. He is never tempted to get drunk. Before the stage of intoxication is reached, he has already acquired a temporary distaste for alcohol, which is his sufficient safeguard.

(2) Persons in whom the point of intoxication is reached before satiety occurs, will, unless other influences intervene, go on drinking until they become intoxicated.

(3) But many persons, who are liable to become intoxicated before satiety occurs, stop drinking before they become drunk. They are not actuated solely by desire for drink. They foresee and recognize the danger of becoming drunk; and, before the point of drunkenness is reached, refuse to indulge further the desire for drink. They exercise their will, under the influence of a number of desires conflicting with that for drink, such as self-respect, and desire to retain the respect of others—exercises of volition which, under such circumstances, we call "self-control." Whether persons, in whom the satiation point lies beyond the limit of sobriety, will become drunk or no, depends primarily upon the relative strength of desire for drink and of such self-control. If desire for drink is the stronger, they will become drunk; if self-control is the stronger they will remain sober. Seeing that the great majority of persons who take alcohol are not drunkards, it follows that, in them, either the satiation point is usually reached before intoxication occurs, or the desire for drink is overmastered by that voluntary reinforcement of other desires which we call self-control.

(4) There is, however, a large number of persons who occupy an intermediate position between the habitually sober and the habitually drunken. These are persons in whom intoxication occurs before satiety is reached, and in whom self-control, if it is exercised, is capable of overcoming the desire for drink, but who yet allow themselves to become drunk, because they do not choose to exercise this self-control. They do not reinforce by voluntary exertion the influence of the desires antagonistic to the desire for drink. They possess sufficient strength of will, if they choose to exert it, to cease drinking before the intoxication stage is reached; but they do not, or they do not always, exert this volition. Either they are not sufficiently alive to the disadvantages of drunkenness, or, realizing them, deliberately decide that such disadvantages are more than counterbalanced by the enjoyment of drunkenness; or they are reluctant to run counter to the practice of their companions; or they feel themselves bound by fashion to continue the practice of treating and being treated; or, for some other reason, they deliberately refrain from exercising the self-control which they possess. These persons form the class of occasional drunkards, week-end drunkards, bank holiday drunkards, convivial drunkards, etc.

(5) Lastly, there are those in whom the satiation point is either postponed until after intoxication is reached, or is altogether absent, and in whom the desire for drink overmasters all other conflicting desires, even when these are reinforced by the utmost exertion of will. Such persons constitute the class of inebriates who fall naturally into the following classes:—

A. Persons who are born with an excessive degree of the common capacity for deriving pleasure from the use of alcohol, but are not endowed with a corresponding exaggeration of that combination of faculties that we call self-control. Deriving more pleasure than others from the use of alcohol, they desire it more strongly. Desiring it more strongly, they need a corresponding increase of self-control to enable them to abstain from its excessive use. Such persons are not necessarily deficient in intelligence, strength of will, or desire to keep sober. They may be superior to the average in some or all of these qualities; but desire for drink is in them so greatly intensified, that a capacity for self-control, even if beyond the average, is insufficient to keep them from excess. Such persons are often of great capability and intelligence, and frequently are members of families in

which other examples of this form of inebriety occur. The desire for drink, which may be very great, is often intermittent or paroxysmal in occurrence; and the amount of alcohol taken is often enormous.

B. Persons who, with or without an excessive degree of the common capacity for deriving pleasure from the use of alcohol, are deficient in self-control. They lack either the intelligence to appreciate the ill effects of drunkenness, or the self-respect and other desires antagonistic to drunkenness, or the force of character and strength of will necessary to withstand the appeal of a desire for immediate indulgence at whatever cost of future detriment. The lack of self-control shows itself not only in inability to withstand the allurements of alcohol, but also in outbreaks of temper, of violence, of restlessness, or of destructiveness, upon slight provocation. Many such persons are deficient in intelligence; they come of families in which there are other instances of mental disorder; and, in them, a small amount of alcohol is usually sufficient to produce intoxication.

C. Besides the congenital peculiarities above mentioned, there is no reason to doubt that continued self-indulgence by the "occasional" drunkard may cause the subordination of self-control to the desire for drink. By continual indulgence, the desire for liquor is increased. This is especially the case when alcohol has been originally taken for some special effect. It may be that its stimulant effect enables the drinker to accomplish tasks impossible without its aid; or it may be (and this is most frequent in women) that it was originally taken in illness, or for the relief of pain or discomfort. Whatever the reason that led to the habit, it is found that, the longer the habit is continued, the greater becomes the desire for the drug, and also that an increasing quantity is needed to produce the effect for which it was originally taken. By continual yielding to desire, and continual failure to exert self-control, not only is desire strengthened, but self-control is weakened, until it is reduced permanently below the point necessary to overcome the desire; and thus inebriety is established. Inebriates of this class are miscellaneous in character. Sometimes they approach to Class A and Class B in family history and mental qualities, but often have little apparent affinity to either. They are inebriated by artificial culture rather than by nature; and, when they are mentally defective or disordered, the defect or disorder is often the consequence, rather than the cause, of the drinking habit.

This view of inebriety, which regards it as an alteration of the ratio of self-control to desire for drink, throws light upon the question whether or not it should be regarded as a disease. It is undoubtedly a constitutional peculiarity; and depends, in many cases, upon qualities with which a person is born, in many is acquired by vicious indulgence. Whether the possession of such a constitutional peculiarity, when inborn, should or should not be considered, from the scientific point of view, a disease, is, perhaps, a question of nomenclature. If such native constitutional peculiarities as the possession of a sixth finger, and the absence of a taste for music, are rightly considered diseases, then the native constitutional peculiarity which underlies many cases of inebriety may be so considered. But there are cogent reasons why the term "disease" should not be used to characterize the inebriate habit. By disease is popularly understood a state of things for which the diseased person is not responsible, which he cannot alter except by the use of remedies from without, whose action is obscure, and cannot be influenced by exertions of his own. But if, as is unquestionably true, inebriety can be induced by cultivation; if the desire for drink can be increased by indulgence, and self-control diminished by lack of exercise; if it is manifest that the reverse effects can be produced by voluntary effort, and that desire for drink may be diminished by abstinence, and self-control, like any other faculty, can be strengthened by exercise. It is erroneous and disastrous to inculcate the doctrine that inebriety, once established, is to be accepted with fatalistic resignation, and that the inebriate is not to be encouraged to make any effort to mend his ways. It is the more so since inebriety is undoubtedly in many cases recovered from, in many diminished, and since the cases which recover or amend are those in which the inebriate himself desires and strives for recovery.

The effect that has been alleged of the habit of self-

indulgence upon the desire for alcohol does not rest merely upon speculation. The desire for alcohol is not felt until its pleasurable effects have been experienced. Antecedent to this experience there is no desire. Moreover, it appears from the evidence of those who have had charge of inebriates, as well as from the statements to them of inebriates themselves, that, with prolonged abstinence, the desire diminishes, and in many cases falls altogether into abeyance, until it is revived by a new experience of alcohol and its pleasurable effect. The habit of inebriety shares with other habits the character that, when once established, it is very easy to re-establish after it has been overcome. The constitutional peculiarity remains; and few inebriates, if any, are able to taste alcohol, even after prolonged abstinence, without reverting sooner or later into the habit of inebriety.

It is quite true that there are inebriates who are congenitally weak-minded—weak in intellect and weak in will—and who are inebriated mainly on account of their mental incapacity. They neither realize the mischief of getting drunk, nor have they the strength of character to struggle against their desire; but although such persons may, in a certain sense of the word, be regarded as diseased, the disease, if it exists, lies in their mental incapacity, which allows of their becoming inebriated, and not in the habit of inebriety. Such persons often have other bad habits, the consequence of their mental condition; but these habits are not separate diseases, but different results of their natural defect. They are wanting in responsibility, not because their inebriety is a disease which attacks and overmasters them, as influenza might, but because their inebriety rests upon a basis of mental defect.

From what has been said, it is evident that, if we could produce satiety before the intoxication point is reached, we could cure inebriety and all forms of drunkenness in the most scientific and effectual manner. Short of this mode, the only method that remains is to alter the ratio between self-control and desire, and restore it to the normal, either by diminishing desire or by increasing self-control, or both.

As has already been stated, desire may be diminished by prolonged abstinence; but it is evident, from the nature of inebriety as hereinbefore explained, that voluntary abstinence on the part of an inebriate cannot often be expected.

It is important to increase self-control as to diminish desire. Although there are some inebriates, belonging to Class A, in whom self-control is at least up to the average, there is no doubt that in a large number it is deficient, and is exhibited in varied phases of conduct. Many inebriates exhibit lack of self-control, not only in indulgence in drink, but also in the abhorrence of steady employment, in excessive sexual indulgence, in violence of temper, and in other ways. The instilment and cultivation of self-control is necessarily an affair of time. It can only be effected by the imposition of steady work, and by a system of rewards and punishments punctually bestowed.

THE HABITUAL DRUNKARDS ACT, 1879.

After a short account of the history of legislation concerning inebriates, the Report proceeds to consider the defects of the Habitual Drunkards Act, 1879, and to propose amendments. It is stated that thirty-two Retreats have been established under its provision. Some have been closed, but approximately twenty institutions have been reported annually as being in regular work, with an average yearly number during the last ten years of about 500 patients. All these Retreats have been provided by philanthropic bodies, religious societies, temperance societies, or private individuals. For persons who can pay as much as three guineas a week there is ample accommodation; for those who cannot afford this sum space is strictly limited; for those who are destitute there is practically no provision.

Results of Detention in Retreats.

The Committee finds that, owing to the difficulty experienced in inducing an inebriate to submit to detention until ill-health or financial ruin places him in the hands of his relatives or friends, patients are apparently admitted too late; and the Report continues as follows:

Although the Act is ostensibly a voluntary one, the evidence of all the managers of Retreats points to the certainty that exceedingly few persons submit to detention of their own free will, the majority being forced to do so by domestic pressure, which, it seems, is not usually applied with success until inebriety is so confirmed as to reduce the hope of permanent reformation.

12. Although evidence has been supplied to us from many sources that, even under these adverse circumstances, something like a third of all persons who have submitted to detention have been transformed into useful citizens; and that a greater number than this have been materially improved; yet, in view of the great difficulty of obtaining proof of reformation, these statements must be received with caution.

Influences detracting from Value of Act.

13. So far as the Act generally is concerned, we find that two main influences have detracted from its value—the absence of accommodation for poor inebriates, and the difficulty experienced in obtaining the consent of inebriates to submit to detention and treatment in earlier and more hopeful stages.

14. With regard to the first of these difficulties, we consider that the State itself, or in combination with local authorities, should provide accommodation for non-criminal inebriates who are destitute, or who can only contribute a small weekly sum towards their own support. During every year, hundreds of persons signify their willingness to submit to treatment, but are unable to procure it, owing to the impossibility of finding money to pay, wholly or partly, for their own maintenance. The advantages, to the State and the community, resulting from the existence of facilities for enabling the early treatment of such cases are manifest. Such treatment would prevent many inebriates from becoming criminals, lunatics, or paupers, and consequently permanent charges upon public funds. The provision of accommodation for this class would not necessarily involve any increased charge upon the public, nor even the provision of new buildings. There are many philanthropic and religious societies in existence who would either extend their present Retreats, or provide new ones, if some financial aid towards maintenance were forthcoming. Without such aid, the present unsatisfactory conditions must continue.

With regard to the objection that the term "habitual drunkard" is considered opprobrious, the Commissioners, while not considering the objection of great importance, agree with the desirability of replacing the term by the word "inebriate" mainly for the reason stated in the following paragraph:

17. We have been satisfied by evidence that an appreciable number of persons become helpless and degraded by the excessive use of narcotic or stimulant drugs or preparations other than alcohol. Although violence, crimes of passion, and offences generally are less common amongst drug takers than amongst alcoholic inebriates, these persons frequently bring disgrace upon their families, and reduce to poverty all who are dependent upon them for support. They also become the subjects of ill-health, or mental and moral deterioration, which not infrequently results in suicide. As the law now stands there is no power to deal with such persons, either for their own good or for that of the community. We are of opinion that any future Act applicable to drunkards should apply to drug takers also. No man or woman who eats drugs in solid form (for example, opium, tabloids, lozenges, etc.), inhales them, or injects them under the skin, and does not drink them, can reasonably be called a "drunkard." For this reason we think the word "inebriate" should be adopted in any future Act, so that it may include those addicted to drugs as well as drunkards.

The Licensing of Retreats.

The Committee, considering that the existing system under which the power of granting licences is in the hands of county and borough councils entails a system of dual control leading to constant difficulty, and to an unworkable division of responsibility, recommends as follows:

III. That the powers to license, and other powers now exercised with respect to retreats by local authorities, should be in the hands of the Secretary of State. That all licensed Retreats should be subject to further inspection by persons, appointed by Quarter Sessions, who should report to the Secretary of State.

Further the Committee, in view of the fact that there is no provision in the Act compelling a Retreat to take out a licence, and that consequently those Retreats which are most defective escape inspection, recommends:

IV. That it should not be lawful for any person for payment to board and lodge in an unlicensed house more than one inebriate at the same time.

The Committee further recommends that the stamp duty on licences of retreats should be abolished.

Leave of Absence.

The Committee recommends:

VI. That the licensee of a retreat should have power to grant leave of absence to any patient therein for any reason the licensee may consider satisfactory, such as business necessities, financial difficulty, or domestic trouble. The report also points out that for whatever period a patient may sign under the Act, a stated number of months can only be a conjecture as to the length of time necessary for reformation; he may be fit for liberty or modified liberty before the expiration of the period, and leave of absence would be available for this purpose.

Retaking of Inmates.

The Committee, considering the procedure for retaking an inmate who has escaped from a retreat dilatory, cumbersome, and often ineffectual, recommends as follows:

VII. That power be given to the licensee of a Retreat, or any person authorized in writing by him, to retake any inmate who has escaped therefrom, or who, during leave of absence, takes or uses any intoxicant. The escape and circumstances of recapture should be notified by the licensee to the Secretary of State, and either to one of the persons signing the statutory declaration made on admission, or to the person who made the last payment on behalf of the inmate.

Transfer.

As considerable difficulty in the management of Retreats has been found to arise from the absence of power to move from one institution to another persons who are dissatisfied or are a disturbing element, the Committee recommends:

VIII. That power be given to the Secretary of State to transfer any inebriate from one Retreat to another; provided that the consent, to such transfer, of the inebriate and of the person who made the last payment on his behalf, have been previously obtained.

Discharge.

As the Committee finds that great inconvenience has occurred owing to orders for the discharge of inebriates from retreats being made before the expiration of the period for which they signed without the knowledge of persons interested, it recommends as follows:

IX. That no order for the discharge of an inmate from a Retreat, before the expiration of the period for which he signed, should be made, unless 14 days' previous notice of the hearing of the application has been given to the licensee of the Retreat, and either to a person who signed the statutory declaration, or to the person who made the last payment on account of the inmate. *Sid. Morrisons* to have a right to attend the hearing and tender evidence.

EXTENSION OF VOLUNTARY PRINCIPLE.

The Committee, being of opinion that the voluntary principle embodied in the Act is valuable and capable of further extension, recommends (1) that inebriates should be allowed to enter into a statutory obligation to abstain from intoxicants; and (2) that it should be possible for an inebriate to make a voluntary application for the appointment of a guardian. These novel suggestions are embodied

in a series of recommendations (X, XI, XII), the nature of which will sufficiently appear from the following paragraphs of the report :

Obligation to Abstain.

27. We propose that the obligation should consist of a formal undertaking on the part of the inebriate to abstain from intoxicants for a specified period not less than one year. The obligation should be entered into before a Justice of the Peace. It should contain a warning that breach thereof would constitute a ground of application for the compulsory measures hereafter suggested (see Para. 36). The form of obligation should be set forth in the Act, and should include a certificate, to be signed by the Justice of the Peace, to the effect that he has explained to the applicant the nature of the document, and the consequences of any breach of the obligation contained therein. These consequences should be clearly shown on the form of obligation.

Voluntary Guardianship.

28. We are convinced that many inebriates, who are deterred by the comparative severity of the conditions required by the present Act, would be prepared to take the far less serious step of submitting themselves to the control of some selected friend. Such a course would involve a minimum of restraint, and might altogether obviate the necessity for detention in an institution.

29. We would, therefore, suggest that provision should be made to enable an inebriate, desiring such an appointment, to make application to a Justice of the Peace for the formal appointment of some person, named by the inebriate, to act as his guardian. The Justice of the Peace should satisfy himself (a) that the applicant is an inebriate; (b) that he understands the nature and effect of his application; and (c) that the person named as guardian is willing to act in that capacity. Being satisfied on these points, the Justice of the Peace should be empowered to appoint the guardian as desired. The term of such guardianship should be for any period named by the applicant, not exceeding one year.

Powers of Voluntary Guardian.

The guardian so appointed should have power :—

(1) To prescribe for the inebriate a place of residence, either in the house of the inebriate or in that of the guardian.

(2) To deprive the inebriate of intoxicants, and prevent him from obtaining them.

(3) To require the inebriate to submit to the control of nurses or attendants, in so far as the guardian may consider necessary.

(4) To warn sellers of drink and drugs, and other persons, against supplying the inebriate; supply after warning to be an offence under the Act.

If, in the opinion of the guardian, the above-named powers prove insufficient to enable him to exercise a proper control over the inebriate, this should form a ground for an application for compulsory measures to be applied.

The two Justices who were empowered by the Act of 1879 to attest the signature of an applicant for admission to a Retreat were by the Act of 1898 reduced to one. No complaint has been made of any ill consequence of this reduction, and we are therefore fortified in recommending that a single Justice should attest all applications for voluntary control. The more serious power of compulsory control should not be exercised except by a Judicial Authority as defined in paragraph 37 below.

30. The Habitual Drunkards Act, 1879, at present provides for the detention of those inebriates only who choose to surrender their liberty of their own free will. Even extended, as suggested by us, it would still be restricted to those who consent to take advantage of its provisions. The Inebriates Act, 1898, hereafter considered, deals only with criminal inebriates and their detention in reformatories.

COMPULSORY GUARDIANSHIP AND COMMITMENT TO RETREATS.

31. There is, however, a class of inebriates who are numerous, whose inebriety is the cause of great distress, misery, poverty, and degradation, to themselves and their families, and who are excluded from the operation of both

these Acts. Any person who drinks to excess, without committing a public offence or crime, can continue his drunken habits indefinitely, notwithstanding that he may produce, over many years, untold misery to his family and ultimate expense to the community. Such persons often at length commit offences, and then may be dealt with under the Act of 1898; but in very many cases they pursue their disastrous habit until they die of disease engendered by it. There is no reason to doubt that, if there existed means by which they could be placed compulsorily under control at an early period in their career, a large proportion of them could be restored to decency and usefulness, and an incalculable amount of misery and poverty could be prevented. At present the only possibility of control for such a person is the somewhat remote chance that he may be persuaded or coerced into making a "voluntary" application for admission into a Retreat.

The existence of this class of drunkards and the necessity of legislating for them was fully recognized by the Committees of 1872 and 1893, and the evidence now taken has confirmed in every respect the views of previous Committees as to the number of inebriates in this class, as to the distress they produce, and as to the urgent need of legislation to deal with them. Upon this point the Committee reports as follows:

We fully appreciate that the application of compulsory powers to persons who have committed no public offence is a strong step to take. But we are convinced that great and widespread distress is caused by such persons, and that power to deal with them compulsorily is urgently needed. We have failed to find satisfactory reasons against the constitution of such powers. It must be remembered that very few inebriates take advantage of the existing "voluntary" powers, except under moral pressure, which virtually amounts to compulsion; and that the alternative to interfering with the liberty of the inebriate is permitting the inebriate to interfere with the liberty of other people. . . .

We find that previous Committees recommended merely that the process should be "under proper safeguards," but that the nature of the safeguards was not sufficiently indicated. This defect we have done our best to repair. Throughout the recommendations that we have made for dealing with both the inebriate offender and the "private" inebriate, we have adhered to the principle of a graduated mode of procedure, beginning with measures of the mildest character, and not increasing their stringency until these milder measures are found to be ineffectual. Moreover, we have combined with the recommendation of compulsory powers, a further recommendation to extend the principle of voluntary submission far beyond its present limits, and to give the inebriate, in every case, the option of voluntary submission before the application of compulsion.

COMPULSORY PROCEDURE FOR DEALING WITH CASES WHERE VOLUNTARY PROVISIONS FAIL.

36. It is to be hoped that the extension of provisions for voluntary submission will result in a number of inebriates availing themselves of these provisions; but it is certain that a considerable proportion will still have to be dealt with compulsorily, if they are to be dealt with at all. It is therefore proposed that—

(1) Power be given to a relative, friend, or guardian voluntarily appointed, to petition a Judicial Authority for a compulsory order of guardianship, or for commitment to a Retreat.

(2) When such a petition is presented, it should be accompanied by a medical certificate, unless the inebriate has refused to submit himself to medical examination; and by a statutory declaration signed by the petitioner and at least one other person to the effect that the alleged inebriate is a person to whom the Act applies.

(3) On receipt of the petition and the documents aforesaid, the Judicial Authority should visit the alleged inebriate or summon him to appear before him to show cause why he should not be subjected to guardianship or committed to a Retreat. These proceedings should be conducted, if desired by the alleged inebriate, in private, both the parties being entitled to be represented by solicitors or counsel.

(4) Having satisfied himself that the alleged inebriate is an inebriate within the meaning of the Act, the Judicial

Authority should point out to him the advantages of the voluntary provisions already suggested. If the inebriate is unwilling to take advantage of these provisions, or if he has previously taken advantage of them, but has failed to observe the conditions thereof, it should be enacted that the Judicial Authority may make an order for either compulsory guardianship or committal to a Retreat.

(5) When the Judicial Authority has satisfied himself that the case is one in which a compulsory order should be made, he should exercise his discretion as to the nature of that order. Guardianship is a less severe measure than detention, and should always be resorted to when practicable, and likely to meet the needs of the case.

(6) If the Judicial Authority is not satisfied, he should adjourn the consideration of the petition, or dismiss the petition. If he is of opinion that the petition is frivolous and vexatious, and ought not to have been presented, he should be empowered to order the petitioner to pay the costs of the proceedings.

37. We recommend that the words "Judicial Authority" shall mean and include a Judge of the High Court of Justice, County Court Judge, Recorder, Stipendiary Magistrate, any two Justices, or any Justice of the Peace specially appointed by Quarter Sessions.

Powers of Compulsory Guardians.

38. An order of guardianship should specify, as guardian of the inebriate, some person or persons willing to act in that capacity. The order should be made for any term not exceeding one year.

The guardian should have power—

(a) To prescribe for the inebriate a place of residence, either in the house of the inebriate or in that of the guardian, or in that of a licensee under the Act, but in no other place.

(b) To place the inebriate in the care of a custodian, being a licensee under the Act.

(c) To deprive the inebriate of intoxicants, and prevent him from obtaining them.

(d) To prevent the inebriate from leaving the prescribed residence unattended by a responsible person.

(e) To require the inebriate to submit to the attendance of such nurses or attendants as the guardian may think necessary.

(f) To warn sellers of drink and drugs and other persons against supplying the inebriate: supply after warning to be an offence under the Act.

(g) To delegate any of the powers (c) to (f) to the custodian.

It should be the duty of the guardian to provide for the inebriate such medical attendance as may be necessary.

The guardian or custodian should have power to release the inebriate on parole with all doubt, conditions, and to relax the powers (d) and (e) at discretion. These suggestions, with certain details as to the mode in which they should be carried out, are embodied in Recommendations XIII to XVIII inclusive.

THE INEBRIATES ACT, 1898.

The next section of the Report considers the defects of the Inebriates Act, 1898, and proposes amendments.

The Committee, while holding that the drunkenness of the occasional drunkard being produced by his own voluntary act, it is just that he should be held responsible for all the consequences, including offences, states that the inebriate stands on a different footing, since in his case the desire for drink is so overmastering, self-control so inadequate, and the ill effects of drink so imperfectly appreciated that it is not proper to hold him fully responsible for offences committed. His mitigated responsibility is recognized by sending him to the milder discipline of a Reformatory instead of to the severer discipline of prison, the right of the community to safeguard itself justifying his detention in a Reformatory so long as the habit which renders him injurious to the community remains.

The Inebriates Act, 1898, was founded on this principle, but during the nine years that it has been in force fewer than 3,000 persons have been committed to Reformatories under its provisions. There has been a decided failure on the part both of judges and magistrates to apply the Act as widely as was intended by the legislature. The Com-

mittee reports that the reasons for this comparative failure are two:

(1) Difficulties connected with the administration of Sections 1 and 2 of the Act, and

(2) The fact that no obligation was laid on any authority or person to provide for committed inebriates or to maintain them during sentence.

Difficulties in Legal Procedure.

To meet the first difficulty the Committee advises that Section 1 should be amended in accordance with the following recommendation:

XX. That Magistrates should have discretionary power to send to Reformatories, in addition to or in substitution for imprisonment, all persons who are adjudged to be inebriates who commit offences which can now be dealt with summarily by committal to prison, and that they should likewise be empowered to deal in a similar manner with inebriates convicted before them of neglect of or cruelty to children, attempted suicide, wounding not amounting to felony, or wilful damage.

With regard to Section 2 of the Inebriates Act, which provides as follows:

(1) Any person who commits any of the offences mentioned in the First Schedule to this Act, and who within the twelve months preceding the date of the commission of the offence has been convicted summarily at least three times of any offences so mentioned, and who is a habitual drunkard, shall be liable upon conviction on indictment, or if he consents to be dealt with summarily on summary conviction, to be detained for a term not exceeding three years in any certified inebriate reformatory the managers of which are willing to receive him.

(2) The Summary Jurisdiction Act, 1879, shall apply to proceedings under this section as if the offence charged were specified in the second column of the First Schedule to the said Act.

the Committee reports as follows:

"During the nine years over which the Act has been in force, fewer than 2,600 persons have been committed to detention in reformatories under the provisions of this section. During the same period 1,751,830 persons were convicted and sentenced in courts of summary jurisdiction for drunken behaviour. Bearing in mind the repeated statements of magistrates, prison officials, and others, regarding the habitually drunken character of a large percentage of these offenders, the number actually dealt with as inebriates is exceedingly small. It amounts to 1 case in 674, or less than 1.5 per 1,000.

"We find that the main causes why the number committed under this section is so small are as follows:

"(1) By some magistrates the existence of the Act is overlooked; others are unwilling to put it in force.

"(2) Inability of magistrates to interpret the definition of 'habitual drunkard' so as to bring certain inebriate offenders within the powers of the section.

"(3) The necessity for proving three previous convictions.

"(4) The necessity for obtaining the consent of the inebriate to be dealt with summarily.

"(5) The lack of accommodation in reformatories, and the power of their managers, for this and other reasons, to refuse to receive inebriates committed from the Courts.

"(6) The three years' sentence."

With regard to causes (1), (3), and (4) the Committee makes the following recommendations:

XXI. That the necessity for proving three previous convictions, before an inebriate can be sent to a Reformatory, should be abolished.

XXII. That the consent of the inebriate to be dealt with summarily should no longer be necessary in order to enable the Magistrate to deal with him, either when the offence is included in Schedule I of the Inebriates Act, 1898, or is one of the offences referred to in Recommendation XX. Provided that any person adjudged to be an inebriate, and sentenced to a Reformatory, should have the right of appeal to Quarter Sessions.

Mr. Arkdis, in a note appended to the report expresses his disagreement with the last sentence, holding that no judicial authority should be empowered to order the detention of an inebriate, at any rate for more than six months, without that inebriate having the right to go before a jury if he chooses, with the consequential rights under the Criminal Appeal Act, 1906.

The Committee states with regard to (5) that it is one of the most potent causes for the limited application of the Act, and expresses the opinion that reformatory accommodation should be available for all cases the courts desire to commit. With regard to (6), the Committee states that, although the Act gives the courts power to commit an inebriate to a reformatory for any period not exceeding three years, the practice has been to inflict the maximum sentence in nearly every case. Further, though the intention of the Act was that this severe sentence should be mitigated by release on probation, under the care of a responsible guardian, this mitigation has fallen largely into disuse, owing, apparently, to two causes: (1) Difficulty in finding a trustworthy person willing to act as guardian, and (2) the fact that the large majority of persons hitherto committed have had a long career in drunkenness, have been many times in prison, and are practically irreformable. The Committee is of opinion that there should be more elasticity, that every inebriate should be considered *prima facie* reformatable, and receive at first a comparatively short sentence, the question of further detention being determined by the inebriate's behaviour on return to liberty.

The Committee, regarding the present system as profoundly unsatisfactory, proposes to substitute for it a scheme founded on the principle of proceeding by graduated measures from the mildest that is likely to be successful to more and more severe as the milder fail of success. This scheme is embodied in the following recommendation:

XXX. That, when a person is charged before a Court of summary jurisdiction with an offence of which drunkenness is an ingredient, or with one of the offences referred to in Recommendation XX, into which drunkenness appears to the court to enter as a contributing cause, the court should consider whether the offender comes within the definition of an inebriate, and if the offender is adjudged to have committed the offence with which he is charged, and to be an inebriate, the court should have power:

(1) To deal with the offender under the Probation of Offenders Act by discharge on recognizances to come up for sentence if called upon. The conditions of probation should be as follows:—in addition to or in substitution for such conditions mentioned in Section 2 (2) of the Probation of Offenders Act, 1907, as are applicable to an inebriate, the Probation Order should contain the following conditions, viz., the inebriate shall not

- (a) Be intoxicated.
- (b) Take or use, or obtain or possess for his own use any intoxicating thing or things.
- (c) Change his abode without previously giving his new postal address to the probation officer.
- (d) Fail to report in person or by letter in his own handwriting on his health and occupation to the probation officer periodically as the court may direct.

The offender should then be subject for a specified time, which should not be less than six months, nor more than one year, to the supervision of a probation officer. We are strongly of opinion that this officer should not be a member of the police force.

Should the inebriate, after discharge on probation, fulfil the conditions of the probation for the full period, he should stand completely discharged; but should he commit any breach of the conditions of his probation, he should be brought before a Court of summary jurisdiction, which should have power, on proof of such breach, either to renew the probation with a caution or surety, or to commit the offender to a reformatory.

(2) Should the court consider release on probation to be undesirable, the court should have power, under the ordinary law—

- (a) To commit the offender, whether he consents to be dealt with summarily or not, and with or without a preliminary penal sentence, to a reformatory for inebriates, or
- (b) To commit the offender for trial as an inebriate offender, care being taken to include inebriety in the indictment.

(3) Courts of Assize and of Quarter Sessions should have power to sentence a prisoner to a Reformatory, with or without a preliminary penal sentence, and in the latter case, to suspend the operation of the order for commitment to a reformatory pending the result of a trial on probation under a probation officer. Should the prisoner fulfil the

conditions of his probation for the full period thereof, he should stand completely discharged; but should he commit any breach of these conditions, he should be brought before a Court of summary jurisdiction which should have power, on proof of such breach, to order the suspended sentence, pronounced by the Court of Assize or Quarter Sessions, to come into force.

Form of Sentence and Conditions of Probation.

With regard to the form of sentence and conditions of probation, the Committee makes the following recommendations:

XXXI. That, when a person is committed to a Reformatory for inebriates for the first time, the sentence should be that he should be detained therein for "a period not exceeding six months," and be subjected on his release to a period of probation not exceeding one year under the charge of a probation officer. Provided always that power should be given to the authorities of Reformatories to release inebriates for short periods on parole, as a preliminary to discharge on probation.

XXXII. That when an inebriate who is released on probation for the first time from a Reformatory forfeits such probation for breach of the conditions thereof, he should be brought before a Court of summary jurisdiction, which should, on proof of such breach, either renew the probation with a caution or surety, or sentence the offender to a Reformatory for "a period not exceeding one year," and to be subjected on his release to a period of probation not exceeding one year under the charge of a probation officer.

XXXIII. That when an inebriate again forfeits such probation for breach of the conditions thereof, he should be brought before a Court of summary jurisdiction, which, on proof as before, should sentence him to detention in a Reformatory for "a period not exceeding two years," and to be subjected on his release to a period of probation as before.

XXXIV. That any subsequent breach of the conditions of probation should be followed by a similar sentence for "a period not exceeding three years," and to be subjected on his release to a period of probation as before.

The Committee is of opinion that such a scheme, while affording adequate safeguards against the detention of inebriates for unnecessarily long periods, would lead to the abolition of repeated prison sentences; would enable inebriates to be treated in their early and reformatable stage; would lead to the reformation of many who now become hopelessly irreformable; would adapt the severity of the measures employed to the needs of the case; and would provide, in the interests of the community, for the prolonged detention of those who have, after ample opportunity for reform, shown themselves incapable of becoming decent and law-abiding members of the community.

Provision as to Inebriates convicted under the Act of 1898.

To provide for cases of confirmed inebriates the Committee makes the following recommendations:

XXXVII. That any inebriate who has been sentenced to a reformatory under the Inebriates Act, 1898, for a period of two years or more, and who, within 12 months of the expiration of his sentence is again convicted of an offence against the amending Act, should be liable on conviction to be sentenced to a reformatory for "a period not exceeding three years," to be followed by a period of probation, if he had been convicted for the fourth time under the system we propose.

XXXVIII. That the Secretary of State should have power to order the release on probation of any inebriate under detention at the time of the passing of the amending Act; and that, when released, the inebriate should, on breach of the conditions of probation, be liable, on conviction, to be sentenced to a Reformatory for "a period not exceeding one year," and to be subjected on his release to a period of probation as before.

Delirium Tremens.

The Committee recommends:

XXXIX. That any person who, by *delirium tremens*, has made himself a charge upon the rates, should *prima facie* be deemed an inebriate, and liable to be proceeded against as such at the instance of the guardians to whom he has made himself chargeable.

STATE INEBRIATE REFORMATORIES' FINANCE.

The Committee gives a short history of State Inebriate Reformatories and recommends:

XXIX.—That the State should continue to provide, maintain, and manage Reformatories for the detention of troublesome or undesirable inmates. That the accommodation provided at Aylesbury for female inmates should be maintained; but that the accommoda-

dation at Warwick for male inmates being inadequate should be supplemented, or replaced, by a new institution specially provided for the purpose.

It is pointed out that there is no obligation on local authorities to establish reformatories, and the Committee expresses the strong opinion that there can be no satisfactory or permanent settlement except on the basis of provision by the State, and makes the following recommendations:

XXV. That the State should, at its own cost, provide for the accommodation and maintenance of all inebriates who are committed by the courts.

Provision for Poor or Destitute in Retreats.

The Committee states that all the retreats established under the Habitual Drunkards Act have been established by voluntary effort either as philanthropic enterprises of proprietary ventures, but none have been adapted to the reception of persons unable to contribute a reasonable sum towards their own maintenance. Under the Inebriates Act county councils can contribute towards the establishment and maintenance of inebriate reformatories, but it is doubtful whether a council could itself establish a retreat, the Committee consequently makes the following recommendations:

XXVII. That the State itself, or in combination with county or borough councils, should provide for the accommodation and maintenance in retreats of inebriates who cannot be suitably provided for, either at their own cost or at that of their relatives or friends.

Purchase by the State.

The Committee observes that there are great differences in the expenditure of different authorities both in respect of establishment and cost of maintenance. It does not regard "magnificence of design, arched ceilings, oak-panelled board rooms with expensive wood carvings, elaborate tiled passages and stained glass windows as essentials." Experience has proved that conditions essential to the proper treatment of an inebriate have been secured to the satisfaction of H.M. Inspector at so low a cost as £100 a bed, and at 11s. 4d. a week per inmate for maintenance. The Committee recommends as follows:

XXVI. That existing Reformatories, so far as they are found suitable and adaptable to a general scheme, should be taken over by the State at a total cost which, including all necessary extensions and alterations, should not exceed £150 per bed, and that the State should provide any further Reformatory accommodation which is found to be necessary, at a cost, if possible, not exceeding this amount.

The Committee further points out that in view of the fact that all inebriates detained in reformatories during 1907 cost the country, in taxes and rates, the sum of 18s. 9d. a head per week, it is clear that such a scheme for State control as is suggested would lead to a large saving. One thousand inebriates, detained under a continuance of the present system, means a charge of £48,883 per annum: whereas the same number controlled by the State, at a sinking fund charge of 3s. 6d. a head, and a maintenance rate of 11s. 4d., would mean a total expense of £38,672 only—a clear saving of £10,211 every year upon every thousand cases under detention.

Work in Reformatories.

The Committee reports that the nature and amount of work undertaken by the inmates of the various institutions visited was noted, and that it was not in all cases as much as was desirable; on this head the following recommendation is made:

XL. That greater facilities should be provided for the execution of remunerative work by inmates of Reformatories.

UNANIMITY OF COMMITTEE.

The report concludes with an acknowledgment of the marked ability with which Mr. H. B. N. Mothersole has discharged his duties as secretary. The report is signed by all the members of the Committee, with the reservation by Mr. Adkins, already noted, and with the further reservation by Dr. Branthwaite that, in accordance with the request of the Secretary of State, he took no part in the inquiry concerning the second reference, nor in the preparation of any paragraphs in the report relating to it.

MINUTES OF EVIDENCE.

A separate volume contains the minutes of evidence, the replies to a series of questions addressed to persons having special experience, and memoranda contributed by various authorities, including Sir T. Clifford Allbutt, Professor Osler, Sir G. O'Farrell, and several associations, including the Society for the Study of Inebriety. An index of the evidence of each witness and a general index are provided.

RECOMMENDATIONS OF THE BRITISH MEDICAL ASSOCIATION IN 1906.

THE following report by the Medico-Political Committee of the British Medical Association on Amendment of the Law Relating to the Detention and Care of Inebriates and Persons suffering from the Habitual Use of Drugs, was approved by the Annual Representative Meeting on July 27th, 1906:

The Committee has considered various proposals which have been put forward with reference to this matter, and has deemed it most convenient to draw up:

- (A) A formal statement of the reasons for which further legislation appears to be necessary, and
- (B) Recommendations as to such legislation.

(A) CONSIDERATIONS AS TO THE NECESSITY FOR LEGISLATION.

1. From the considerations placed before the Committee, it appears to be clearly established that there are in all classes of society persons who are, by indulgence to excess in intoxicating liquor, or in the use of stimulant, sedative, or narcotic drugs or substances—

- (a) at times incapacitated from performing their duties to themselves, their families, or the State; and
- (b) by the same cause, at times rendered dangerous or offensive to themselves, their families, or the public.

2. The number of such persons is sufficiently great, and their conduct in consequence of excessive indulgence in alcohol, etc., as aforesaid, is sufficiently noxious to render it desirable that there should be means of restraining them from such excessive indulgence;

3. It is found by long and frequent experience that no means, except compulsory deprivation of the alcohol, or drug, is efficient in restraining such persons from their excessive indulgence;

4. There is at present no legal power by which such persons can be subjected to compulsory deprivation of alcohol unless they themselves so desire, or unless they have been repeatedly convicted of offences, and no legal power by which the takers of drugs in excess can under any circumstances be subjected to compulsory deprivation of such drug;

5. In the opinion of the Committee, there is urgent need that legislation should be provided by which such persons could be placed under suitable control and restrained from excessive indulgence in alcohol, or drugs, as the case may be, whether they are willing to be so controlled or no, and whether or no they have been convicted of an offence;

6. The Committee recognizes the gravity of a recommendation which, if carried into effect, will authorize the deprivation of some of the liberty of persons who may have committed no crime or offence recognized by the law; and would include in its recommendation safeguards against the improper application of the powers that they desire to be created. It is of opinion that efficient safeguards may be constituted in two ways—namely, first, by requiring the consent of a judicial authority before any person can be restrained for such cause as is herein indicated; and second, by giving power to such judicial authority to give costs against any applicant for a detention order, whose application ought not, in the opinion of the judicial authority, to have been made.

(B) RECOMMENDATIONS.

Persons to be Placed under Restraint.

1. Subject to the safeguards stated in paragraph 6 of part (A) of this report, the Committee is of opinion that

powers should be given to a judicial authority to place under restraint, in spite of his own objection thereto, any person who is so addicted to the habitual use of alcohol or opium, or any stimulant, sedative, or narcotic drug or substance as

- (a) to render him at times dangerous to himself or others;
- (b) to render him at times incapable of managing himself or his affairs.

Form of Restraint.

2. If, in the opinion of a judicial authority, any person comes within the description of the last paragraph, then the judicial authority should have power to order that such person be committed for any period not exceeding three years to the custody of (a) any person named in the order willing to act as guardian; or (b) the managers of any licensed Retreat or Inebriate Reformatory who are willing to receive him. When any person is admitted to a Retreat or Reformatory under these circumstances, all conditions shall apply as if he had been admitted to a Retreat or Reformatory under the Inebriates Acts, 1879-1900. Power should be given to the Secretary of State to transfer the inebriate from the control of any guardian in whose charge he may be placed under order of court—

- (1) If the person in whose charge he was so placed declines to continue his responsibility or becomes incapable of properly exercising it,
- (2) If the inebriate cannot be restrained from the use of alcohol or other substance as aforesaid.

Such power of transfer should include power to transfer the inebriate from the charge of the guardian to a licensed retreat or inebriate reformatory, or from a retreat to a reformatory, or from one retreat or reformatory to another.

Power to Deal with Estates.

3. Power should also be provided to deal with the estates of persons who are, by indulgence to excess in alcohol or drugs, at times incapable of administering their estates with ordinary prudence.

Procedure.

4. In the opinion of the Committee the following matters should be provided for in any measure that deals with the persons under consideration:

- (A) The judicial authority should be set in motion by petition.
- (B) The provision as to the person by whom the petition is to be presented should be analogous to that contained in Section 5, Subsection (1), of the Lunacy Act, 1890.
- (C) The petition should be supported by affidavits or by documents having the force of documents made on oath.
- (D) The judicial authority should have power:
 - (a) To visit or cause to be brought before him the person whose conduct is in question.
 - (b) To make such further inquiries and summon such witnesses, including the husband or wife of the person complained of, as he may think necessary.
 - (c) To adjourn the inquiry.
 - (d) To make an order for the immediate committal of the person as hereinbefore suggested.
 - (e) To make an order for the committal of the patient at any time within months of the date of the order, contingent on the behaviour of the patient and at the discretion of the petitioner.
 - (f) To dismiss the petition without or with costs against the petitioner, according as, in the opinion of the judicial authority, the petitioner has, or has not, acted in good faith, and without malice.
 - (g) To make a maintenance order on the estate of the inebriate, or to require guarantee that maintenance expenses shall be met.
- (E) Protection should be afforded to all persons who have in good faith, and with reasonable care, done anything purporting to be done under the legislation proposed.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

SURGEON W. G. EDWARDS has been placed on the retired list, December 16th, 1908. He was appointed Surgeon, June 9th, 1902.

The following appointments have been made in the Admiralty: Inspector-General C. PEARSON, M.D., to Chatham Hospital, January 17th; Staff Surgeon M. L. M. YARDIN, M.B., and Surgeon E. S. WILKINSON, M.B., to the *Defence*, on recommissioning, undated; Fleet Surgeon G. A. S. BELL and Surgeon R. M. KROGALL, to the *Bedford*, additional, January 15th, and on recommissioning, undated; Fleet Surgeon F. RAUDSLEY, to the *Warrior*, on recommissioning, undated; Fleet Surgeon E. CORCORAN to the *President*, additional, for three months' course at the West London Hospital, January 11th; Fleet Surgeon R. H. J. BROWNE and Staff Surgeon E. D. J. O'MALLEY to the *Indra*, on recommissioning, February 2nd; Staff Surgeon R. L. DICKINSON to Plymouth Hospital, January 18th; Surgeon A. W. IRDELL to Plymouth Hospital, January 9th; Surgeon L. F. COPE to the *Victory*, for temporary service, undated.

ARMY MEDICAL SERVICE.

COLONEL P. M. ELLIS to be Surgeon-General, vice W. B. Slaughter, retired, December 31st, 1908. Surgeon-General Ellis's previous commissions are thus dated: Surgeon, August 5th, 1877; Surgeon-Major, August 5th, 1889; Surgeon-Lieutenant-Colonel, August 5th, 1897; Colonel, August 15th, 1901. He served with the Burmese expedition in 1886-7, receiving a medal with clasp. He has since been Principal Medical Officer, 7th Division, Irish Command, and Administrative Medical Officer, Irish Command, successively.

Lieutenant-Colonel R. JENNINGS, M.D., from the Royal Army Medical Corps, is promoted to be Colonel, vice P. M. Ellis, December 31st, 1908. Colonel Jennings was appointed Surgeon, February 5th, 1881; Surgeon-Major, February 5th, 1893; and Lieutenant-Colonel, February 5th, 1901. He was in the South African war in 1900-2, being present in operations in Cape Colony and in the Transvaal; he was mentioned in despatches, and received the Queen's medal with three clasps and the King's medal with two clasps.

ROYAL ARMY MEDICAL CORPS.

Colonel O. E. P. LLOYD, V.C., serving in India as Principal Medical Officer, Bareilly and Garhwal Brigades, is transferred to the 1st (Postal) Division as Divisional Principal Medical Officer, December 31st, 1908. Captain P. G. GASTON, from the Indian Medical Service, to be Captain, vice H. G. S. WEBB, who exchanges, November 28th, 1908.

INDIAN MEDICAL SERVICE.

LIEUTENANT-COLONEL A. M. CROFTS, C.I.E., Bengal, is promoted to be Colonel, from October 15th, 1908. He was appointed Assistant-Surgeon, March 31st, 1877, and became Surgeon-Lieutenant-Colonel, March 31st, 1897. He was in the Afghan war in 1878-80 at Candahar and with the Khyber brigade, including the affair at Jugtulluk (medal); in the Egyptian war of 1882, being present at the action of Kassasin and at the battle of Tel-el-Keir (medal with clasp, and Khedive's bronze star); with the Ziboh Valley expedition in 1897; and in the China war in 1900 (medal). Colonel Crofts has since been appointed Principal Medical Officer, 7th (Meerut) Division.

Lieutenant J. F. BOYD is promoted to be Captain, from September 1st, 1908, provisionally, subject to his passing the departmental examination in October.

Colonel C. H. BEATSON, C.B., Bengal, took over the duties of Principal Medical Officer, 1st (Punjab) Division, from December 15th, 1908. Captain G. BROWNE, Senior Medical Officer, Kohat, is directed to act as Principal Medical Officer on the departure of Colonel Beatson.

Lieutenant-Colonel H. G. L. WORTABET, M.D., Madras, Officiating Principal Medical Officer, Burmah Division, is granted leave out of India until June 21st, pending retirement.

SPECIAL RESERVE.

ROYAL ARMY MEDICAL CORPS.

CAPTAIN W. H. G. H. BEST, from the late Royal Army Medical Corps (Military), to be Captain, September 20th, 1908.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

For Attachment to Units other than Medical Units.—The following officers, from the 4th Battalion the Cheshire Regiment, to be Captains, December 1st, 1908:—Surgeon-Captain C. T. GREEN and Surgeon-Captain A. R. WILSON, M.D. A. D. Low to be Lieutenant, November 11th, 1908.

Highland Mounted Brigade Field Ambulance.—The following officers, from the Seaforth and Cameron Bearer Company, Royal Army Medical Corps (Volunteers), are appointed, with rank and precedence as in the Volunteer Force, April 1st, 1908:—Major J. MACDONALD, M.B., and Lieutenant J. W. MACKENZIE, M.D. A. C. BALFORTH to be Lieutenant, April 1st, 1908.

First Home Counties Field Ambulance.—Captain J. M. ROGERS-TILLES to be Major, April 27th, 1908.

First East Lancashire Field Ambulance.—Lieutenant C. W. HUTT, from the 3rd East Lancashire Field Ambulance, to be Lieutenant, September 22nd, 1908.

Third East Lancashire Field Ambulance.—G. A. JELLY to be Lieutenant, September 22nd, 1908.

First London Field Ambulance.—Captain (Honorary Captain in the Army) E. W. ST. VINCENT-RYAN to be Major, September 2nd, 1908.

Sanitary Service.—The announcement, relating to Captain C. K. BOWES, Captain F. R. JEFFERISS, and Lieutenant A. C. BIRD, which appeared in the *London Gazette* of October 23rd, 1908, is cancelled, and the following substituted: Surgeon-Captain B. JEFFERIES, from the 4th Volunteer Battalion the Queen's Own (Royal West Kent Regiment), to be Captain, with precedence as in the Volunteer Force, April 1st, 1908. Surgeon-Captain C. K. BOWES, M.D., from the 1st Volunteer Battalion the Buffs (East Kent Regiment), to be Captain, April 1st, 1908. A. C. BIRD to be Lieutenant, August 12th, 1908.

For Attachment to Units other than Medical Units.—Captain C. B. KER, M.B., from the 1st Lothian Bearer Company Royal Army Medical Corps (Volunteers), to be Captain, with precedence as in the Volunteer Force, April 1st, 1908; Lieutenant J. ANDREW, M.B., to be Captain, April 1st, 1908; W. S. PATTERSON, M.B. (late Surgeon-Lieutenant 2nd Volunteer Battalion the Highland Light Infantry), to be Lieutenant, November 2nd, 1908; H. W. A. COWAN, M.B., to be Lieutenant, November 27th, 1908.

Hospitals and Asylums.

ST. ANDREW'S HOSPITAL FOR MENTAL DISEASES, NORTHAMPTON.

THE annual report of this private asylum for the upper and middle classes for the year 1907 contains the report of the Committee and that of the Medical Superintendent, Dr. J. Bayley. The Committee are again able to report favourably of the state of the Institution and its houses at Moulton Park and Bryn-y-Neuadd. The latter, the seaside house of the asylum, now under the direction of a resident medical officer, Dr. Archdall, was visited by 174 patients during the year, as compared with 158 during 1906. During the year 89 patients were admitted in their payments, the amount of assistance rendered to make up the payments to the lowest rates ordinarily charged being £3,641. The financial state of the hospital was exceedingly satisfactory. From the report of Dr. Bayley we see that on January 1st, 1907, there were in the hospital 412 patients and that on the last day of the year there were 415. The total number of cases under care during the year was 496 and the average number daily resident 410. During the year 64 in all were admitted, of whom 68 were first admissions. In 31 the attacks were first attacks within three and in 13 more within twelve months of admission; in 30 not-first attacks within twelve months of admission, and in 10, whether first attacks or not, of more than twelve months' duration on admission. They were classified according to the forms of mental disorder into: Mania of all kinds, 42; melancholia of all kinds, 29; dementia, 8; general paralysis, 2; acquired epilepsy, 1; and congenital or infantile defect, 2. Concerning the probable etiological factors, alcohol was assigned in 5, previous attacks in 18, old age and the menopause in 8, mental or emotional stress in 23, and venereal disease in 3. Hereditary influences were ascertained in 14. During the year 34 were discharged as recovered, giving a recovery-rate on the admissions of 40.4 per cent.; 6 as relieved, and 27 as not improved; also during the year there were 15 deaths, giving a percentage death-rate on the average numbers resident of 3.1 per cent. The deaths were due in 4 cases to cerebro-spinal diseases, with 2 from general paralysis; in 4 to chest diseases, with only 1 death from pulmonary tuberculosis; in 1 to abdominal disease; in 3 to general diseases, including senile decay; and in 1 case—that of a female who committed suicide whilst on trial with her friends—to accident. No case of infectious disease occurred at the hospital during the year or at any of the houses belonging to it, and there do not appear to have been any serious casualties.

ROXBURGH, BERWICK, AND SELKIRK DISTRICT ASYLUM.

FROM the annual report and statistical tables furnished by Dr. J. Carlyle Johnstone, the Medical Superintendent of this asylum, for the year ending May 15th, 1908, we see that on May 15th, 1907, there were 329 patients on the asylum register, and on May 15th, 1908, there were 333. The total cases under treatment during the year numbered 407 and the average number daily resident 353.39. In consequence of the improvements and extensions which have been carried out of late years and now, with the exception of the administrative block, completed, ample and suitable accommodation is available for all cases of insanity occurring in the district. During the year 78 cases were admitted, of whom 62 were first and 16 not-first admissions. Of the total admissions, in 33 the attacks were first attacks within three and in 13 more within twelve months of admission; in 21 not-first attacks within twelve months of admission, and the remainder, whether first attacks or not, were of more than twelve months' duration (8), or of congenital origin (3). The admissions were classified, according to the forms of mental disorder, into: Mania of all kinds, 26; melancholia of all kinds, 31; senile and secondary dementia, 4; delusional insanity, 4; general paralysis and epileptic insanity, 4 each; insanity with gross brain lesion, 2; and congenital or infantile defect, 3. The main probable causes of mental disorder in these cases were assigned in the following numbers: Alcohol in 23, or in the unusually high proportion of just under 29 per cent.; venereal disease in none; critical periods in 20; epilepsy and cerebral disease in 7; various bodily disorders in 5; and mental or emotional stress in 16. Hereditary influences were ascertained in 32, or 41 per cent., and congenital defect existed in 7. During the year 28 were discharged as recovered, giving a recovery-rate of 35.8 per cent. on the total admissions; 11 as relieved, and 2 as not improved. During the year also there were 33 deaths, giving a death-rate on the average numbers resident of 9.8 per cent. The deaths were due in 14 cases to cerebro-spinal diseases, with only 4 deaths from general paralysis; in 4 cases to diseases of the heart and blood vessels, in 3 to respiratory diseases, in 1 to Bright's disease, and in the remaining 11 to general diseases. Although pulmonary tuberculosis was returned as the principal cause of death in only 1 case, it was ascertained to be present in an active form in 18.1 per cent. of all deaths. The institution was visited, as usual, by influenza, but, on the whole, the general health was satisfactory, and no serious accident occurred.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

IN seventy-six of the largest English towns, including London, 9,035 births and 5,535 deaths were registered during the week ending Saturday last, January 9th. The annual rate of mortality in these towns, which had been 12.8 and 18.2 per 1,000 in the two preceding weeks, declined again last week to 17.5 per 1,000. The rates in the several towns ranged from 10.0 in Newport (Mon.), 10.2 in York, 10.4 in Hornsey, 10.5 in East Ham, 11.6 in Aston Manor, 11.8 in Walthamstow, and 11.9 in Smeethwick, to 22.6 in Stockport and Merthyr Tydfil, 22.9 in Bury, 23.6 in Walsall, 23.7 in Oldham, 25.4 in Great Yarmouth, 27.2 in Middlesbrough and 27.3 in Hanley. In London the rate of mortality was 18.0 per 1,000, while it averaged 17.3 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 4.0 per 1,000 in the seventy-six towns; in London this death-rate was equal to 1.5 per 1,000, while among the seventy-five other large towns these infectious diseases caused death-rates ranging upwards to 2.6 in West Ham and in Sunderland, 2.7 in Merthyr Tydfil, 3.4 in Hull, 4.3 in Leicester, 4.9 in Great Yarmouth, 5.8 in Warrington, and 6.9 in Hull. Measles caused a death-rate of 1.1 in Huddersfield and in Sheffield, 1.3 in West Hartlepool, 1.8 in West Ham, 2.0 in Merthyr Tydfil, 2.3 in Sunderland, 2.8 in Hull, 2.9 in Great Yarmouth, 4.0 in Middlesbrough, 4.1 in Leicester, and 4.3 in Warrington; diphtheria of 1.2 in Rochdale and 1.3 in Reading; whooping-cough of 2.0 in Great Yarmouth; and diarrhoea of 1.1 in Northampton and 1.5 in Middlesbrough. The mortality from scarlet fever and from typhoid fever was not excessive in any of the large towns, and no fatal case of small-pox was registered during the week. The number of scarlet fever patients remaining under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital at the end of last week was 3,347, against 3,537, 3,474, and 3,557 at the end of the three preceding weeks; 323 new cases were admitted during the week, against 381, 305, and 379 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

DURING the week ending Saturday last, January 9th, 1,096 births and 698 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 19.7, 19.3, and 18.3 per 1,000 in the three preceding weeks, rose again to 19.5 per 1,000 last week, and was 2.0 per 1,000 above the mean rate during the same period in the seventy-six large English towns. The rates in the eight Scottish towns ranged from 13.4 in Leith and 15.2 in Aberdeen to 24.9 in Dundee and 27.9 in Perth. The death-rate from the principal infectious diseases averaged 2.0 per 1,000, the highest rates being recorded in Glasgow and Paisley. The 326 deaths registered in Glasgow included 3 which were referred to scarlet fever, 16 to diphtheria, 25 to whooping-cough, 2 to enteric fever, and 7 to diarrhoea. Five fatal cases of diarrhoea were recorded in Edinburgh; 2 of scarlet fever and 3 of diarrhoea in Dundee; 4 of whooping-cough and 2 of diarrhoea in Aberdeen; and 2 of diarrhoea in Paisley.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, January 9th, 666 births and 446 deaths were registered in the twenty-two principal urban districts of Ireland, as against 720 births and 537 deaths in the preceding period. The annual death-rate in these districts, which had been 19.3, 20.5, and 24.7 per 1,000 in the three preceding weeks, fell to 20.4 per 1,000 in the week under notice, this figure being 2.9 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 23.6 and 27.7 respectively, those in the other districts ranging from 14.8 in Sligo and 7.8 in Galway to 35.4 in Lurgan and 35.9 in Clonmel, while Cork stood at 19.2, Londonderry at 16.9, Limerick at 27.3, and Waterford at 13.6. The zymotic death-rate in the twenty-two districts averaged 1.2 per 1,000, as against 1.1 per 1,000 in the preceding period.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure priority in this column, advertisements must be received not later than the first post on Wednesday morning.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

The British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. Od., and the **BRITISH MEDICAL JOURNAL** is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association, and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the **BRITISH MEDICAL JOURNAL** for non-members is £1 8s. Od. for the United Kingdom, and £1 15s. Od. for abroad.

SPECIAL NOTICE TO MEMBERS.

Every member is requested to preserve this "Supplement," which contains matters specially referred to Divisions, until the subjects have been discussed by the Division to which he belongs. **BY ORDER.**

MATTERS REFERRED TO DIVISIONS.

PUBLIC HEALTH COMMITTEE.

REPORT

ON

DESIRABILITY OF HEALTH OFFICERS BEING REQUIRED TO GIVE THEIR WHOLE TIME TO THE WORK.

INTRODUCTORY.

The Annual Representative Meeting at Sheffield instructed the Council to refer the following proposition for the consideration of the Divisions:—

That Health Officers should give their whole time to the work.

The Council has thought it desirable that the Divisions should have the assistance in their deliberations of an explanatory Memorandum prepared by the Public Health Committee, which is now submitted accordingly.

The object of the Memorandum is to set forth as clearly and impartially as possible the more important considerations, on both sides of the question, which require duly weighing before any decision is arrived at. It is proposed that upon receipt of the expressions of opinion of the Divisions a Report indicating a definite policy in accordance with the general tenor of those replies shall be prepared, which, after submission to the Divisions and adoption, if approved by the Annual Representative Meeting, will constitute the declared policy of the Association on the subject.

REFERENCE.

As there is possibility of doubt as to the intended scope of the proposition stated in the Resolution of the Representative Meeting, the Committee thinks it well to make clear the exact question which it understands that the Divisions are desired to discuss, namely, that by the term "Health Officers" are to be understood for the present purpose Medical Officers of Health only, and that by "giving their whole time to the work" is meant to their public work as distinguished from private practice.

If these assumptions are correct, the question referred may conveniently be stated as follows:—

Should Medical Officers of Health be debarred from engaging in private practice?

For the information of the Divisions it may be stated that Medical Officers of Health appointed by County Councils are already required (by Section 17 of the Local Government Act, 1888) to devote their whole time to the duties of the office.

A.—Reasons in Favour of whole-time Appointments.

The more important reasons which have at various times been assigned in favour of whole-time appointments are:—

- (1) That the duties are usually of such a character as to need the undivided attention of the officer, and should not be liable to suffer from the conflicting claims of private practice upon his time and energies.
- (2) That the statutory and other responsibilities of a Medical Officer of Health are such as may frequently make it his duty to take action prejudicial to the interests of individuals, some of whom, if he is

engaged in private practice, may be his patients, and that he ought not to be put in the position of having to choose between offending them and neglecting the enforcement of the law.

- (3) That, apart from questions specially affecting his own patients, a medical officer engaged in private practice is more likely to be influenced by local prejudices than a whole-time officer.
- (4) That specialisation in public health work is desirable.
- (5) That the appointment of whole-time officers is preferable, from the purely professional point of view, because (a) there is less likelihood of friction arising in their case than in that of part-time officers when their public duties bring them into contact with the private patients of other practitioners, (b) because a Medical Officer of Health who is engaged in private practice receives, in his official capacity, introductions to potential patients in ways which, though perfectly legitimate, are not open to his fellow practitioners in the same district.
- (6) As showing the tendency of public opinion among those who give special attention to Public Health, it is to be noted that the Royal Commission on Labour, the Housing Commission of 1885, and the Select Committee on the Housing of the Working Classes Acts Amendment Bill of 1906, have all reported in favour of the Medical Officer of Health giving his whole time to the work, coupling with this a recommendation that he be given reasonable security of tenure of office. The views held by the Local Government Board, as indicated in the Reports issued from the Medical Department of the Board during many years past, and more particularly of late years, are very distinctly in favour of Medical Officers of Health being debarred from private practice.

B.—Reasons Against whole-time Appointments.

As against the adoption of a uniform rule of whole-time appointments it is urged:—

- (1) That the appointment of part-time officers is more economical, particularly in the case of thinly populated rural districts, many of which could not by themselves afford the salaries of whole-time officers.
- (2) That if such districts are in all cases (as already in some cases) combined into districts large enough to pay an adequate salary to a whole-time officer, the needs of each locality cannot receive the same close and prompt attention as from several part-time officers.
- (3) That for the same amount of salary practitioners of a higher professional standing can be obtained if they are allowed to engage also in private practice than if they are required to give their whole time to the work.
- (4) That the clinical experience and the closer knowledge of the homes of people obtained in private practice increase the usefulness of the Medical Officer of Health.
- (5) That from the professional point of view it is preferable that the emoluments should be distributed over a larger number of members of the profession than would be the case if all such appointments were whole-time.

N.B.—It will be understood that the above paragraphs, headed A and B, are simply statements of views put forward by advocates of either opinion, and do not in either case necessarily express the opinions of the Committee.

Question Submitted.

The Division is requested to express its opinion for or against the proposition,

"That Medical Officers of Health should be debarred from engaging in private practice, and to add any qualifications, comments, or additional suggestions bearing on the matter which it may desire.

E. J. DOMVILLE,
Chairman, Public Health
Committee.

January 5th, 1909.

KS To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

COUNCIL MEETING.

A MEETING of the Council will be held at 2 o'clock in the afternoon of Wednesday, January 27th, in the new Council Room, at 429, Strand, London, W.C.

By Order.

January 21st, 1909.

GUY ELLISTON.

BRANCH AND DIVISION MEETINGS TO BE HELD.

LEINSTER BRANCH.—The annual general meeting will be held on Saturday, February 13th, in the Royal College of Physicians, Kildare Street, Dublin, at 4.30 p.m. The annual dinner will be held in the College Hall at 7.30 p.m. of the same day.—ARTHUR H. WHITE, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: HAMPSHIRE DIVISION.—A special and ordinary meeting of this Division will be held on Tuesday, January 26th, 1909, at 4.55 p.m. and 5 p.m., at St. Peter's Hall, Belsize Square, N.W. (behind St. Peter's Church), Dr. Oppenheimer in the chair. Agenda (*Special Meeting*, 4.55 p.m.): To alter Divisional Rule No. 7 in accordance with the existing Article xxvii of the Association, so as to permit of the election of the Representative to the Representative Meeting "not more than 9 months nor less than 3 weeks before the Annual Representative Meeting," instead of "not more than 3 months nor less than 3 weeks before the Annual Representative Meeting," as in the former Article xxvii of the Association. The Honorary Secretary will read a letter from the Medical Secretary on the subject. Agenda (*Ordinary Meeting*, 5 p.m.): 1. Minutes. 2. Letters. 3. Questions. 4. Report of Representatives on the Branch Council. 5. Annual report to the Branch (including financial report). 6. Hampshire Hospital business; to consider a letter from the Hospitals Committee of the Association. 7. To consider the questions submitted to Divisions on p. 11 of the Medico-Political Committee's report on the medical inspection of school children and the treatment of those found defective (see BRITISH MEDICAL JOURNAL of December 26th, 1908, pp. 1869 to 1874, and January 7th, 1909, pp. 96 to 102, and pp. 107 and 108). 8. Other business.—R. A. YELD, Honorary Secretary, Hampstead.

METROPOLITAN COUNTIES BRANCH: RICHMOND DIVISION.—A special meeting will be held on January 27th at 8.30 p.m. at the Bridge House Café, Richmond Bridge, to consider the Report on the Medical Inspection of School Children.—G. CARDNO STILL, Honorary Secretary.

NORTH OF ENGLAND BRANCH: NORTH NORTHUMBERLAND DIVISION.—A meeting will be held at the Infirmary, Berwick-on-Tweed, on Thursday, January 28th, at 2.15 p.m. Business: (1) Confirmation of minutes. (2) Reports from Secretary. (3) Paper on Rheumatoid Arthritis, by Dr. Wilson of Glanton. (4) Any other business.—C. CLARK BURMAN, Secretary, Alnwick.

SOUTH-EASTERN BRANCH: BRIGHTON DIVISION.—There will be an ordinary meeting of the above Division on Wednesday, January 27th, at the Dispensary, Queen's Road, Brighton, commencing at 4.30 p.m. Agenda: Minutes and correspondence. Cases and specimens. Communication from Dr. W. A. Hollis in connexion with the resolution which was passed in favour of dividing up the South-Eastern Branch. To consider a report from the Medico-Political Committee with regard to the inspection of school children and the treatment of those found defective. Any other business. All members are invited to show cases and specimens at the meeting.—RYMING MARSH, Honorary Secretary, Hove, Brighton.

SOUTH MIDLAND BRANCH: NORTHAMPTONSHIRE DIVISION.—A meeting of the Division will be held in the Board Room of the Northampton General Hospital on Tuesday, January 26th, at 2.30 p.m. Business: Minutes. Annual report of Representative of Division. Revision of Divisional rules. Medical inspection of school children. Paper on the results of radical operations for uterine cancer by Thomas Wilson, M.D., F.R.C.S., of Birmingham.—FEVERELL S. HICHENS, Honorary Secretary, Northampton.

ULSTER BRANCH.—The winter meeting of this Branch will be held in Belfast on Wednesday, February 3rd. Members having communications are requested to send particular notices not later than January 23rd to CECIL SHAW, M.D., Honorary Secretary, Belfast.

THE SEVENTY-SEVENTH ANNUAL MEETING

OF THE

BRITISH MEDICAL ASSOCIATION,

BELFAST,

JULY 23RD TO JULY 31ST, 1909.

President :

SIMEON SNELL, Hon.D.Sc., F.R.C.S.Edin., Ophthalmic Surgeon, Royal Infirmary, Sheffield.

President-elect :

Sir WILLIAM WHITLA, M.D., LL.D., Professor of Materia Medica and Therapeutics, Queen's College, Belfast.

Past-President :

HENRY DAVY, Hon.D.Sc., M.D., F.R.C.P.Lond., Physician, Royal Devon and Exeter Hospital, Exeter.

Chairman of Representative Meetings :

JAMES ALEXANDER MACDONALD, M.D., M.Ch., R.U.I., Physician, Taunton and Somerset Hospital.

Chairman of Council :

EDMUND OWEN, Hon.D.Sc., LL.D., F.R.C.S., Consulting Surgeon to St. Mary's Hospital, London.

Treasurer :

EDWIN RAYNER, M.D.Lond., F.R.C.S., Surgeon, Stockport Infirmary, Stockport.

The Seventy-seventh Annual Meeting of the British Medical Association will be held in Belfast in July, 1909. The President's address will be delivered on Tuesday, July 27th, and the Sections will meet on the three following days. The Annual Representative Meeting will begin on Friday, July 23rd, 1909.

PROGRAMME OF BUSINESS.

The Address in Medicine will be delivered by FREDERICK TAYLOR, M.D., F.R.C.P., Consulting Physician, Guy's Hospital.

Professor KOCHER has been invited to deliver the Address in Surgery.

The Address in Obstetrics will be delivered by Sir JOHN W. BYERS, M.D., Professor of Midwifery and Diseases of Women, Queen's College, Belfast.

The Popular Lecture will be delivered by Dr. J. A. MACDONALD, Physician to the Taunton and Somerset Hospital, Chairman of the Representative Meetings.

THE SECTIONS.

The scientific business of the meeting will be conducted in fifteen Sections, which will meet on Wednesday, July 28th, Thursday, July 29th, and Friday, July 30th.

The President, Vice-Presidents, and Honorary Secretaries of each Section constitute a Committee of Reference for that Section, and exercise the power of inviting, accepting, or declining any paper, and of arranging the order in which accepted papers shall be read. Communications with respect to papers should be addressed to one of the Honorary Secretaries.

A paper read in the Section must not exceed fifteen minutes, and no subsequent speech must exceed ten minutes.

Papers read are the property of the British Medical Association, and cannot be published elsewhere than in the BRITISH MEDICAL JOURNAL without special permission.

The following are the general arrangements so far as they are yet complete :

ANATOMY AND PHYSIOLOGY.

President : CHARLES SCOTT SHERRINGTON, M.D., F.R.S., Physiological Laboratory, University, Liverpool.

Vice-Presidents : Professor THOMAS HUGH MILROY, M.D., F.R.S.E., Queen's College, Belfast; Professor PETER

THOMPSON, M.D., King's College, Strand, London; ARTHUR PHILIP BEDDARD, M.D., F.R.C.P., 44, Seymour Street, Portman Square, London, W.

Honorary Secretaries : ALEX. LOW, M.B., 142, Blenheim Place, Aberdeen; JOHN ALEX. MILROY, M.D., Queen's College, Belfast.

DERMATOLOGY AND ELECTRO-THERAPEUTICS.

President : WILLIAM CALWELL, M.D., 6, College Gardens, Belfast.

Vice-Presidents : ROBERT BRIGGS WILD, M.D., 96, Mosley Street, Manchester; LESLIE ROBERTS, M.D., 46, Rodney Street, Liverpool.

Honorary Secretaries : JAMES HARRY SEQUEIRA, M.D., F.R.C.P., 8A, Manchester Square, London; S. ERNEST DORE, M.D., 26, New Cavendish Street, London; JOHN CAMPBELL RANKIN, M.D., 38, University Road, Belfast.

DISEASES OF CHILDREN.

President : HAROLD J. STILES, F.R.C.S.Edin., 9, Great Stuart Street, Edinburgh.

Vice-Presidents : JOHN McCRAW, M.D., 74, Dublin Road, Belfast; RICHARD WHYTOCK LESLIE, M.D., "St. Heliers,"

Strandtown, Belfast; ROBERT CAMPBELL, F.R.C.S., 21, Great Victoria Street, Belfast.

Honorary Secretaries: ANDREW FULLERTON, F.R.C.S.I., 8, University Square, Belfast; JOHN WILLIAM SIMPSON, M.D., 19, Lansdowne Crescent, Edinburgh.

HAEMATOLOGY AND VACCINE THERAPY.

President: SIR ALMROTH WRIGHT, M.D., F.R.S., 6, Park Crescent, Regent's Park, London, N.W.

Vice-Presidents: ALEX. GARDNER ROBE, M.B., 15, University Square, Belfast; THOMAS HOUSTON, M.D., 95, Great Victoria Street, Belfast; Captain STEWART RANKIN DOUGLAS, I.M.S., Inoculation Department, St. Mary's Hospital, London.

Honorary Secretaries: WILLIAM DUNLOP DONNAN, M.D., 12, High Street, Holywood, co. Down; DUDLEY W. CARMALT-JONES, M.B., B.Ch.Oxon., 78, Wimpole Street, London, W.

INDUSTRIAL DISEASES AND PUBLIC HEALTH.

President: LOUIS COLTMAN PARKES, M.D., 61, Cadogan Square, Chelsea, London.

Vice-Presidents: SAMUEL AGNEW, M.D., Lurgan, co. Armagh; HENRY O'NEILL, M.D., 6, College Square East, Belfast; CHARLES KILLICK MILLARD, M.D., Town Hall, Leicester.

Honorary Secretaries: CHARLES PORTER, M.D., Public Health Department, Town Hall, Finsbury; WILLIAM MCLORINAN, L.R.C.P., 103, Antrim Road, Belfast; THOMAS CARNWATH, M.B., Town Hall, Manchester.

LARYNGOLOGY, OTOTOLOGY, AND RHINOLOGY.

President: ST. CLAIR THOMSON, M.D., F.R.C.P., 28, Queen Anne Street, London.

Vice-Presidents: ERNEST BLECHYNDEN WAGGETT, M.B., 45, Upper Brook Street, London, W.; V. P. HENRY SMURTHWAITE, M.D., 8, St. Mary's Place, Newcastle-on-Tyne; J. A. KNOWLES RENSCHAW, M.D., 11, St. John Street Manchester.

Honorary Secretaries: HAROLD SHUTTLEWORTH BARWELL, F.R.C.S., 55, Wimpole Street, London; JOHN STODDART BARR, M.B., 13, Woodside Place, Glasgow; HENRY HANNA, M.B., B.Sc., 57, University Road, Belfast.

MEDICINE.

President: PROFESSOR JAMES ALEXANDER LINDSAY, M.D., F.R.C.P., 3, Queen's Elms, Belfast.

Vice-Presidents: ARTHUR FOXWELL, M.D., F.R.C.P., 47, Newhall Street, Birmingham; JOSEPH FRANCIS O'CARROLL, M.D., F.R.C.P.I., 43, Merrion Square, Dublin; LAURISTON ELGIE SHAW, M.D., F.R.C.P., 64, Harley Street, London; WILLIAM BAIRD MCQUITTY, M.D., 8, College Square East, Belfast.

Honorary Secretaries: JOHN SMYTH MORROW, M.D., Eira House, Antrim Road, Belfast; LEWIS ALBERT SMITH, M.D., 25, Queen Anne Street, London, W.; JOHN ELDER MACLIVANE, M.D., 55, University Road, Belfast.

NAVY, ARMY, AND AMBULANCE.

President: Fleet Surgeon J. LLOYD THOMAS, R.N.

Vice-Presidents: Inspector-General ROBERT BENTHAM, R.N. (retired), 22, King's Avenue, Ealing, London, W.; Lieut.-Colonel R. PORTER, R.A.M.C., P.M.O., Station Hospital, Military Barracks, Belfast; Colonel THOMAS H. HENDLEY, I.M.S., C.I.E., 4 London Road, London, N.W.

Honorary Secretaries: Captain M. LOWSLEY, R.A.M.C., St. Michael's Road, Aldershot; Captain HERBERT HUGH BLAIR CUNNINGHAM, M.D., F.R.C.S., 69, University Road, Belfast; Surgeon EDMUND COX, M.B., R.N., The Royal Naval Hospital, Chatham.

OBSTETRICS AND GYNAECOLOGY.

President: JOHN CAMPBELL, M.D., F.R.C.S., Crescent House, University Road, Belfast.

Vice-Presidents: ROBERT ALEXANDER GIBBONS, M.D., 29, Cadogan Place, London; JOHN SINGLETON DARLING, M.B., High Street, Lurgan; CHARLES EDWIN PUSLOW, M.D., 192, Broad Street, Birmingham; EWEN JOHN MACLEAN, M.D., 12, Park Place, Cardiff.

Honorary Secretaries: HENRY THOMAS HICKS, F.R.C.S., Derby; ROBERT JAMES JOHNSTONE, M.B., F.R.C.S., 14, University Square, Belfast.

OPHTHALMOLOGY.

President: JOHN WALTON BROWNE, M.D., 10, College Square North, Belfast.

Vice-Presidents: ARTHUR W. SANDFORD, M.D., 13, St. Patrick's Place, Cork; WILLIAM MARCUS KILLEN, M.D., 9, Clifton Street, Belfast; ALEX. HILL GRIFFITH, M.D., 17, St. John Street, Manchester.

Honorary Secretaries: JAMES ANDREW CRAIG, F.R.C.S., 11, University Square, Belfast; LESLIE JOHNSTON PATON, F.R.C.S., 1, Spanish Place, Manchester Square, London.

PATHOLOGY.

President: Professor WM. ST. CLAIR SYMMERS, M.B., Queen's College, Belfast.

Vice-Presidents: WALTER SYDNEY LAZARUS-BARLOW, M.D., Cancer Research Laboratory, Middlesex Hospital, London; ARTHUR EDWARD MOORE, M.B., Castlemahon, Blackrock, Cork; ASLEY VAVASOUR CLARKE, M.D., 37, London Road, Leicester; Professor I. WALKER HALL, M.D., 9, Royal Park, Clifton, Bristol.

Honorary Secretaries: ALFRED EDWARD BARNES, M.B., 348, Glossop Road, Sheffield; OTTO F. F. GRÜNBAUM, M.D., 34, Wimpole Street, London, W.; WILLIAM JAMES WILSON, M.D., Pathological Laboratory, Queen's College, Belfast.

PHARMACOLOGY AND THERAPEUTICS.

President: Professor RALPH STOCKMAN, M.D., F.R.S. Edin., The University, Glasgow.

Vice-Presidents: Professor WALTER ERNEST DIXON, M.D., Pharmacological Laboratory, Cambridge; NEWMAN NEILD, M.D., 9, Richmond Hill, Clifton, Bristol.

Honorary Secretaries: VICTOR GEORGE LEOPOLD FIELDEN, M.B., 84, Dublin Road, Belfast; HECTOR CHARLES CAMEBORN, M.B., Guy's Hospital, London, S.E.

PSYCHOLOGICAL MEDICINE.

President: OTTERTON WOOD, M.D., 40, Margaret Street, Cavendish Square, London.

Vice-Presidents: GEORGE ROBERT LAWLESS, F.R.C.S.I., District Asylum, Armagh; WM. RICHARD DAWSON, M.D., 41, Upper Fitzwilliam Street, Dublin; ROBERT HENRY COLE, M.D., 25, Upper Berkeley Street, London, W.; MICHAEL JAMES NOLAN, L.R.C.P. and S.I., Down District Asylum, Downpatrick.

Honorary Secretaries: WALTER SAMUEL SMYTH, M.B., District Asylum, Antrim; SIDNEY HERBERT CLARKE, M.B., Leicester and Rutland Asylum, Narborough, Leicestershire.

SURGERY.

President: Professor THOMAS SINCLAIR, M.D., F.R.C.S., 22, University Square, Belfast.

Vice-Presidents: CHARLES ALFRED BALLANCE, M.V.O., M.S., F.R.C.S., 106, Harley Street, W.; Sir PETER O'CONNELL, M.D., 9, College Square North, Belfast; ARTHUR JOHN DREW, F.R.C.S., Water Hall, St. Aldate's, Oxford; JOHN GALWAY COOKE, M.B., City and County Infirmary, Londonderry; ARTHUR BROWNLOW MITCHELL, F.R.C.S.I., 18, University Square, Belfast.

Honorary Secretaries: W. THRELWALL THOMAS, F.R.C.S., 84, Rodney Street, Liverpool; G. LENTHAL CHEATLE, C.B., F.R.C.S., 117, Harley Street, London; HOWARD STEVENSON, M.B., F.R.C.S.I., 2, College Square North, Belfast; JAS. BERNARD MOORE, M.B., 11, Clifton Street, Belfast.

TROPICAL MEDICINE.

President: CHARLES WILBERFORCE DANIELS, M.B., London School of Tropical Medicine, Albert Docks, London.

Vice-Presidents: Lieutenant-Colonel ANDREW DRANE, I.M.S., Royal Victoria Hospital, Belfast; Surgeon General W. R. BROWNE, M.D., C.I.E., 5, Royal Crescent, Holland Park Avenue, London.

Honorary Secretaries: JAMES COLVILLE, M.D., 7, University Square, Belfast; Dr. ANTON BREINL, Director Runcorn Research Laboratories.

PROVISIONAL TIME TABLE.

FRIDAY, JULY 23RD, 1909.

11 A.M.—Annual General Meeting followed by Representative Meeting.

SATURDAY, JULY 24TH, 1909.

9.30 A.M.—Representative Meeting.

MONDAY, JULY 26TH, 1909.

Honorary Local Secretaries—

HENRY LAWRENCE MCKISACK, M.D., M.R.C.P.,
17, University Square, Belfast.CECIL EDWARD SHAW, M.A., M.D., M.Ch.,
9, University Square, Belfast.HOWARD STEVENSON, B.A., M.B., F.R.C.S.I.,
2, College Square North, Belfast.NOTICE OF CHANGES OF BOUNDARIES OF
DIVISIONS.

THE following change has been made in accordance with the Regulations of the Association, and takes effect from the date of publication of this notice:

That the Rhymney Valley be transferred from the area of the Monmouthshire Division of the South Wales and Monmouthshire Branch to the area of the Cardiff Division of that Branch.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

METROPOLITAN COUNTIES BRANCH.

A SPECIAL general meeting of the Branch was held at the St. James's Vestry Hall, Piccadilly, W., on December 30th, 1908, at 4.30 p.m. The PRESIDENT of the Branch, Sir Victor Horsley, F.R.S., was in the chair, and there was a large attendance of members.

The *Petition for a Charter*.—The meeting was called upon a requisition signed by upwards of fifty members, to consider a proposal to instruct the Branch Council to petition the Privy Council with a view to securing such amendments in the Charter as would provide: (1) That the Referendum be taken on a decision of a majority of the Council; and (2) that it be taken by means of a letter to every member of the Association. On the agenda paper

was placed the following resolution, to be moved by Dr. F. J. SMITH:

That this special meeting of the Metropolitan Counties Branch of the British Medical Association instructs the Council of the Branch to oppose, by petition or otherwise, the application for a Royal Charter in its present form now made by the Association to the Privy Council, and is of opinion that the granting of such Charter should be postponed until the Association has reconsidered the question of the Referendum, and has approved of amendments to the Charter so as to provide (1) that a Referendum shall be taken on the vote of a simple majority of the Council; (2) that a Referendum vote shall be taken by means of a postal voting paper addressed to every member of the Association.

Dr. LAURISTON SHAW had given notice that he would move as an amendment:

That this meeting of the Metropolitan Counties Branch, recognizing that the provisions of the Charter as finally drafted are the outcome of exhaustive discussion and of ultimate agreement by the properly constituted authorities of the Association, and being confident that any reasonable changes subsequently asked for by the Association will not be refused by the Privy Council, is of opinion that the best interests of the Association demand that every member should loyally support the application now being made, and should postpone all attempts to obtain amendments of the Ordinances until the Charter has been formally granted.

The requisition calling the meeting having been read, the CHAIRMAN informed the meeting that he had endeavoured to ascertain whether it would be difficult or not to obtain changes of the Ordinances of purely domestic concern after the Charter had been granted, and read two letters. The first was addressed by the Medical Secretary of the Association, on the instruction of the Chairman of the Organization Committee, to the Association's Solicitor, Mr. W. E. Hempton, asking him whether there was every reason to believe that under the Charter the Privy Council would give its assent to any change of Ordinances of purely domestic concern, such as that relative to the Referendum (Ordinance 17), provided that the desire for such change had been clearly expressed by the Association in the constitutional manner provided by the Charter and Regulations thereunder. The second letter contained Mr. Hempton's reply, which was as follows:

I am of opinion, and have every reason to believe, that no obstacle would be sought by the Privy Council to be placed in the way of this being done, but that, on the contrary, they would be prepared cordially to afford facilities to that end.

Dr. MAJOR GREENWOOD, on a point of order, asked the Chairman whether Dr. F. J. Smith's motion could be properly discussed by the meeting? He submitted that, as the effect of the said motion, if carried, would be to instruct the Council of the Branch to do something which was altogether *ultra vires*, it was a waste of time to discuss it. He drew attention to Article V of the Articles of Association, which laid down that Branch Councils should be constituted in accordance with the by-laws, and then referred to By-law 7, which stated that the "management of the affairs of each Branch shall be vested in a Branch Council." In his opinion, according to the existing constitution of the Association, a Branch Council could deal with nothing beyond matters connected with the Branch. The CHAIRMAN replied that this was a point requiring a legal opinion and he would not give a ruling upon it. If Dr. Smith's motion was carried, the opinion of the Solicitor to the Association could be obtained by the Council of the Branch. But Dr. Smith's motion might be lost, and Dr. Lauriston Shaw's or some other amendment carried, in which case the Branch Council would not be instructed to perform any doubtful action. He took a note of Dr. Greenwood's objection in case Dr. Smith's motion was carried, but ruled that the discussion on Dr. Smith's resolution should proceed. He then called on Dr. Smith to propose his resolution. Dr. SMITH stated that it had been suggested to him that the motion as it appeared on the agenda paper was not fully in accordance with the terms of the requisition calling the meeting, and desired to substitute for it the following:

That this special meeting of the Metropolitan Counties Branch of the British Medical Association instructs the Branch Council to petition the Privy Council with a view to secure such amendments of the Charter as will provide (1) that the Referendum be taken as a decision of a bare majority of the Council, and (2) that it be taken by means of a letter to every member of the Association.

The CHAIRMAN explained the circumstances under which the motion had been drafted in the form in which it appeared on the agenda paper, and stated that Dr. Smith had agreed that it should be printed in that form; the responsibility rested with Dr. Smith. The CHAIRMAN put from the chair Dr. Smith's request for leave to amend his resolution in the way proposed, but the meeting, by a show of hands, did not grant leave. Upon this, Dr. SMITH declined to move the resolution standing in his name. Dr. CRICHTON therefore moved it *pro forma* in his stead; and, after the motion had been seconded, Dr. LAURISTON SHAW proposed the amendment which has been given above. This was seconded by Dr. HUGH R. KER. Dr. F. J. SMITH, Mr. ANDREW CLARK, and Dr. EWART having spoken on the subject, Mr. WITHERS GREEN moved, that the question be now put. This proposition was seconded and carried. Dr. LAURISTON SHAW's amendment being put to the meeting was carried by 118 votes to 23. On the amendment being put as the substantive motion, Dr. HAWTHORNE moved an amendment to it to the effect that a postal vote should be taken of the members of the Branch on the question whether or not the Branch Council be instructed to submit to the Privy Council the opinion of the Branch that the Charter should contain a clause to provide that a Referendum should be taken on the requisition of a majority of the Council and by letter to every member of the Association. This amendment was ruled to be out of order by the CHAIRMAN, as was a similar one proposed by Dr. O'SULLIVAN. Dr. LAURISTON SHAW's amendment was then put as the substantive motion, and carried by a large majority. The CHAIRMAN thanked the members for their attendance, and declared the meeting to be at an end.

WESTMINSTER DIVISION.

A MEETING of this Division was held on January 7th at the Florence Restaurant, Rupert Street, Dr. WILLIAM EWART in the chair. Thirty members were present.

Confirmation of Minutes.—The minutes of the previous meeting were read.

Appointment of Honorary Secretaries.—The appointment of Mr. J. Howell Evans as co-Secretary with Mr. Harvey Hilliard was confirmed.

Executive Committee and Representative on Branch Council.—The following recommendations of the Executive Committee were accepted:

That Mr. J. Howell Evans be elected a member of the Executive Committee to fill the vacancy occasioned by the resignation of Sir William Bennett.

That Mr. Harvey Hilliard be elected as Representative, and Dr. Haslip as Deputy Representative of the Division on the Branch Council.

Annual Representative Meeting.—The report of the Representative of the Division at the Sheffield Meeting (Dr. F. J. McCann) was read and adopted.

Report of Medico-Political Committee.—The report of the Medico-Political Committee *re* school children was adjourned for discussion at a special meeting to be held on January 21st, at the Florence Restaurant, at 9 p.m.

The Future Treatment of the Insane.—In the unavoidable absence of Dr. G. H. Savage, the CHAIRMAN opened a discussion on the Future Treatment of the Insane with brief remarks on the broader aspects. He said that in its nature insanity was of two types, either developmental or degenerative, and in its etiology of two mechanisms, either toxic or traumatic, in the wider sense of these terms. No great therapeutic result could be expected unless treatment were to be (1) applied at the earlier beginnings of the affection, and (2) adjusted to the various phases and levels of mental disablement. Viewed as a disease, the primary indication was, as in any other functional derangement, hygienic. "A Hygiene of Disease" should henceforth occupy a recognized place in our therapeutics. It was specially called for in the treatment of insanity. This hygiene of sickness was essentially an adaptation of the "hygiene of health" for all of our functions, but particularly for those specially stricken, and was to be carried out on the fundamental lines of (1) *nutrition*, (2) *rest*, and (3) *exercise*. Nutrition implied *emunction* and the indispensable "correction of the juices"; and the other two factors were receiving ever-increasing attention. The more special lines of treatment

would have to be determined according to the share which the future might allot to the structural and to the functional etiological factors. It had been suggested that the future treatment would be mainly *bacteriological* and *surgical*. But the urgent question of the day was that of environment. Where and under what conditions should our treatment of the insane be conducted?—at their own homes, in private institutions, in public asylums, or in general or special hospitals? The view was gaining ground that home treatment was often the best for early cases and for convalescents; and that special hospitals were needed where advanced work, such as was now carried out at Claybury, could be carried out not only in pathology, but in the neglected field of specialized therapeutics.

Dr. F. W. MOTT, F.R.S., said that a system of selection was necessary whereby cases might be treated according to one of three methods: the *hospital* for the acute recoverable cases, the *colony* for the physically fit but mentally deficient, and the *custodial* for the incurable and chronic cases. An attempt had already been made at the recently built London County Asylums to place the acute cases in a separate villa for observation, and a number of these cases had been discharged, having never mixed with the chronic lunatics. This was a step in the right direction, but he was particularly interested in the scheme for the establishment of an acute hospital in London, the nature of which he briefly outlined. Eighteen months ago Dr. Henry Maudsley approached the London County Council through him to found an acute hospital in London, offering to give £30,000 for the purpose. This offer had been accepted by the Council, and in the last report of the Asylums Committee it is stated:

We take this opportunity of expressing our satisfaction at the prospect that before long the County of London will possess an institution which will provide specially for the early treatment of acute cases of mental disease. We have long desired that such an institution should be established.

Again the report of the Committee stated:

The most forcible argument for the provision of the hospital, from the point of view of the patient, lies, as it seems to us, in the fact that it will provide opportunity for individual treatment and close personal attention, which are all-important in the early stages of mental disorder.

Dr. Mott said the report also referred to many other advantages which would accrue from the establishment of a mental hospital in London in close association with the general hospitals, their medical schools, and the university; and it concluded by saying

that the acceptance of Dr. Maudsley's generous offer would confer a great and lasting benefit upon a class of sufferers the effectual assistance of whom has hitherto been amongst the most difficult of social problems.

In Berlin, Munich, and other cities and towns of Germany there were a psychiatric clinic and laboratories associated with the university. The effect of such an association had been the rapid development there of clinical and pathological knowledge of mental diseases and the proper systematic training of asylum officers, graduates, and post-graduates in psychological medicine. Dr. Mott asked what better testimony they could have of its national importance and usefulness than the concluding statement in the report, coupled with the testimony of the distinguished alienist physician, Dr. Maudsley, who, by his long experience and knowledge of mental diseases, and who, by his philosophic writings on the physiology and pathology of mind, had gained a world-wide reputation, and was prepared to support his opinion of the necessity of founding such a hospital by a gift during his lifetime of £30,000. Dr. Maudsley would like to see the institution in being, but as yet nothing had been done owing to the difficulty of obtaining a suitable site. Soon after the announcement of Dr. Maudsley's magnanimous offer a similar project was started at Baltimore, and the Americans with characteristic promptitude sent the architect and future director to Europe to learn all the latest developments. They applied to him—Dr. Mott—to know what had been done. When told, the architect said that probably their building would be completed while we were thinking about it. It was well to deliberate before acting, but prolonged deliberation was to be regretted when on all sides such a hospital was recognized as of national importance.

Dr. COUPLAND endorsed the suggestive remarks of Dr. Mott, who was entitled to speak with authority upon

matters to which he had devoted the best years of his life. At the same time, whilst fully admitting the manifest imperfection of available statistics of insanity, Dr. Coupland said he felt that they were not without instruction. For even on the question of heredity they pointed clearly to its preponderant influence in the transmission of a vulnerable nervous system, whose balance might be easily upset by agencies that did not disturb the nominally healthy brain. Dr. Savage had proposed to discuss the future treatment of the insane, a subject intimately bound up with the conclusions arrived at by the recent Royal Commission, whose exhaustive report pointed to a very wide extension of legalized segregation and custody of persons at present uncared for, whose liberty was a peril to the State in many ways. The proposals which logically followed upon the evidence taken by that Commission, could not but materially modify cherished opinions of the liberty of the subject and convince people of the practical impossibility of drawing a line between the "feeble-minded" and the "insane." The promulgation of such recommendations—even if not immediately followed by legislative enactment—ought further to result in a change in the popular conception of insanity and a wider recognition of its nature as a disease to be treated and, as far as possible, prevented. The proposals to deal with cases of incipient insanity without resort to legal certification, to encourage hospital treatment and the formation of farm colonies, indicated advances in the true direction that might eventuate in the gradual elimination of large asylums, admirably equipped and managed as they are in this country, but which from their very character could not be so helpful towards restoring a patient to sanity as more limited and home-like surroundings. Many asylums now were provided with detached buildings for the hospital treatment of acute cases, but, generally speaking, it would almost seem as if England, the pioneer in the more enlightened and humane treatment of insanity, had somewhat fallen behind other nations in certain respects. One could, however, look forward to her regaining her position through the influence on public opinion effected by the labours of the Royal Commission and the enlarged opportunities for scientific study of the subject in accordance with the aims of Dr. Maudsley and Dr. Mott.

Dr. R. LANGDON-DOWN said the subject under discussion had already been dealt with so fully by Dr. Mott, and so well rounded off by Dr. Sidney Coupland, that he should have hesitated to rise had he not been bound in courtesy to comply with the request of his host and their Chairman, Dr. Ewart. The treatment of insanity as a disease had in times past held a different position from that of other diseases, owing to the circumstance that by its very nature it came more obviously and directly into conflict with the public convenience. Owing to the fact that in some cases there was danger to life, limb, and property, not only of the patient, but of those about him, the question had been dealt with primarily as a matter of the protection of the community and the individual under forms of law. This was of course the wrong way to approach a disease as such, and the therapeutics of insanity had suffered accordingly. There were, however, signs of an important change in the attitude of the community, which could be read in the recent report of the Royal Commission on the Feeble-minded. For example, the report proposed that in future, instead of every insane patient being described as a lunatic or person of unsound mind requiring detention, whatever the nature or degree of his defect, it would be possible, should legislation follow on the lines of this report, for the medical adviser to say this case of mental defect was one requiring supervision, that case one for which simple certification was desirable, while for this case certification and detention were necessary. Similarly, it was proposed to make provision for observation wards for incipient cases and for temporary certification of unconfirmed disease, while farm colonies and other methods appropriate to the conditions of different patients were contemplated. One saw also evidence of the recognition of the fact that insanity did not spring suddenly into existence *de novo*, but could be traced back to earlier stages when it could be more effectually dealt with. Here, then, there was promise of improved methods in the treatment of the insane.

Mr. J. HOWELL EVANS was inclined to consider that too much stress had been made of heredity in many diseases,

including insanity—for example, in tuberculosis, where heredity was once considered even the sole cause, it was now found to be a difficult task to give any sound evidence of a heredity factor as opposed to family environment. Now normal heredity, with its tendency to health in the evolution of the species, demanded far greater consideration than the assumption that a disease, tendency to a disease, or basis for a disease was heredity. The trauma of childbirth was known to cause many cerebral defects; was it not fair to consider many later cerebral conditions might be the result of such traumatism? Many congenital lesions had been shown by the investigations of antenatal pathology to be due to toxic and microbic factors of external origin transmitted from the mother to her child, and daily the array of evidence against the hereditary transmission of disease was increasing. Syphilis (acquired, congenital, and of the third generation) was now being shown to be due to the persistence of the spirochaete, so that shortly they might expect to learn that as this disease, which accounted for so much insanity, was due to a definite organism, so also might other forms of insanity be shown to be due to microbic effects from without.

Dr. FINUCANE spoke in reference to (a) the overcrowding at London County Council asylums and the dirty conditions of some of these institutions as previously noted by himself; (b) the too early discharge of insane patients reported to have recovered; (c) the difficulties met with in seeking a direct connexion—especially among women—of a history or evidence of syphilis, acquired or inherited, in cases of general paralysis; (d) the present obscurity of the pathology of insanity and the possibility of the change being rather biochemical than of pathological or parasitic invasions.

Dr. T. D. SAVILL wished to express his appreciation of Dr. Mott's remarks and to endorse the great need which existed for the foundation of a hospital for the treatment of incipient insanity. England was sadly behind the times in this respect. He had just returned from Germany, where he had visited Professor Kraepelin's hospital at Munich. When approaching this building, any one would suppose that it would house 600 or 700 patients; but there were only 140 beds, three-fourths of the building being devoted to laboratories of all kinds for the investigation and extensive hydrotherapeutic and other departments for the treatment of mental disorders. Another point he wished to refer to was the larger space devoted to single wards. In Professor Ziehen's clinic at the Charité Hospital in Berlin the proportion of single wards to larger wards was in the ratio of 1 patient to 3 patients segregated. Quite fifty of Professor Ziehen's patients were housed in single or double wards. Dr. Savill thought the present system of the segregation of lunatics was most unscientific, even if it was not actually cruel. The rational treatment of lunacy in its incipient stages could be carried out only in most cases by "single care." In the course of his practice he was brought into contact with a considerable number of incipient lunatics, but he had the strongest objection to sending them to asylums in the present circumstances. He was proud to think that it was over three years since he signed a lunacy certificate. If the patient could not remain with his friends, he (Dr. Savill) always urged his going into the family of a doctor or some other place involving "single care." He wished more medical men would lay themselves out for this self-sacrificing work, and receive these troublesome cases into their homes for a time.

Dr. DONALD BAYNES said he wished to ask Dr. Mott as to the eventual termination of the patients received in his acute hospital. Were they to be permitted to go out and propagate children who must have a taint of insanity? For example, he knew a man and a woman who met in a private asylum and fell in love. They were dismissed as cured, married, had three children, and were subsequently both sent back to the asylum. What about the children?

Dr. BERNARD O'CONNOR said that had he known that they were to have so interesting a discussion, he would have prepared some remarks on the rigidity of the phrase "of unsound mind" which appeared on the lunacy certificate. A man presenting a strong will and other marked characteristics throughout his life was often regarded as a genius, or at least as a remarkable man; another who showed similar qualities, but not before mature age, had a chance of being certified as being "of unsound mind" by a certain class of alienists. He had in his mind the case of a

gentleman, aged 65 years, who had been condemned as being "a person of unsound mind." One of the certificates alleged that "he is of failing memory," then it added, "senile mental changes"—which, to the speaker's mind, in this case, might seem the same thing—"rambles in his conversation," "is very forgetful as to past facts and dates," etc., and that was about all! Now he contended that if, by that test, a man was to be put away in an asylum, then some of the judges on the Bench, many practising physicians and surgeons, many members of the Bar, many successful business men—and even some of those very men who signed such certificates also—should be made to accompany him. In fact, if such a test were rigidly applied, he did not see how any one over, let them say, 50 years of age, could escape; for at that age, as a rule, a man had passed his prime; his muscular and pulmonary and cardiac strength was not what it was, say, twenty years before. His eyesight was less keen, and his hearing had become probably less acute; hence he was not perfectly sound physically. He was, therefore, "unsound"; and contemporaneously with these body changes they noted corresponding mind alterations. They often found a man, apparently in good health for his age, who might be a little slow of thought; who, during conversation, might be in search of a word, quasi-equivalent to one which he had used a moment before, generally a verb; often forgetful of names of persons, and not infrequently of names of things as well; he might also repeat or omit a word or two in a hastily-written letter, and, indeed, omit some particular letter in the spelling of a word—and it was generally the same word—all which he used not to do formerly. How often one heard him say in conversation: "Oh, the word has gone," or "the thought has gone." Now, such a man, engaged, perhaps, actively in the duties of his calling, was literally and etymologically of "unsound"—that is, not of sound-mind; but was he, on these facts, to be classed with lunatics and with those who were described technically as "persons of unsound mind"? The men who would sign such certificates as these said, by their diagnoses, "Yes," and signed accordingly.

The following resolution, proposed by Dr. INGLIS PARSONS, was passed unanimously:

The Westminster Division of the British Medical Association, being impressed by the necessity for establishing a hospital for the treatment of patients suffering from acute insanity, urges the Central Council to approach the London County Council with a view to their taking immediate steps to establish the hospital suggested by Dr. Maudsley, and to accept his offer of endowment.

WATFORD AND HARROW DIVISION.

A MEETING of the Division was held at Harrow on January 5th, Dr. EDWARDS in the chair, and there was a fair attendance.

Confirmation of Minutes.—The minutes were read and confirmed.

Auditors.—Dr. Hall and Dr. Lambert were appointed auditors.

Report re Referendum.—Dr. WILLIAMS, the Representative of the Division, reported upon the present position regarding the application for the Charter, and said he thought the opposition on account of the Referendum would now cease.

Hospital Certificates.—A letter from the Medical Secretary was read re the giving of certificates by the hospitals in the district, and the Honorary Secretary was instructed to ascertain the custom at the following hospitals: West Herts Hospital, Harrow Cottage Hospital, Watford Cottage Hospital, Stanmore Cottage Hospital, Bushey Cottage Hospital.

Appointment of Representative.—A letter from the Medical Secretary was read suggesting the advisability of the earlier appointment of Representative, and pointing out that the Organization Committee was authorized to sanction, on behalf of the Council, an alteration of the Division rules where necessary to secure this object.

School Clinics.—A long report from the Medico-Political Committee, a copy of which had previously been sent to each member of the Division, was read, and an interesting and animated discussion ensued, the CHAIRMAN opening with a very complete summary of the position at present. The general opinion was that school clinics and special

buildings are undesirable in small towns and rural districts, but the establishment of a General Medical Service was favoured. Finally, it was resolved that the following resolutions of the Division, slightly modified from that already presented to the Representative Meeting by Dr. Williams of Harrow, would best meet the case.

That the medical inspector should report the defect to the Education Committee.

That the Education Committee should notify the parent or guardian that the defect must be at once attended to.

That where the parent or guardian showed that he was unable to pay the fees required, the Education Committee should give a voucher for the payment of the fees on a fixed scale—after the manner in which payments are made for soldiers on furlough in districts where there is no available officer of the Royal Army Medical Corps.

In this way the relations of the medical man, and his patient will not be disturbed, as a free choice would be left to the parent or guardian to select his own medical man; but it should be distinctly enacted that charitable institutions should not be made use of in this connexion. The following replies were given to questions contained in the letter:

1. *Inspection (a), (b), (c), (d).*—That the appointment of medical inspectors should be offered as frequently as possible to men in general practice in each district, and that the most suitable system of payment is that adopted by the Herts County Council.

2. *Treatment.*—No school clinics should at present be started in small towns or rural districts, but the surgeries of general practitioners should be recognized.

3. *Payment* should be by voucher, as already described.

4. More adequate provision should be made by charitable institutions for ascertaining the financial position of the cases the treatment of which they undertake.

5. That a written report shall be given by the medical inspector of all defects found, and this report shall be handed to the medical practitioner when treatment is applied for.

OXFORD AND READING BRANCH:

READING DIVISION.

A MEETING of this Division was held on January 9th. Thirteen members were present, including Dr. Price, Senior Medical Officer to the Borough Schools, and Dr. Taylor, Consulting Medical Officer to the County Council (rural areas).

Medical Inspection of School Children.—The Division, by 7 votes out of 13, was in favour of payment by salary for urban districts. For rural districts it was proposed and carried:

That where a school nurse is employed there should be a minimum payment of 2s. per child inspected and a 3d. capitation fee for every child upon the school roll, and adequate remuneration for travelling expenses and clerical work.

Regarding the treatment of children found defective, Dr. TAYLOR suggested:

That in rural areas school clinics shall only apply to diseases of the eye and teeth, at all events until some system of working such clinics has been properly tested.

This suggestion was agreed to.

SOUTH-EASTERN BRANCH:

CANTERBURY AND FAVERSHAM DIVISION.

A MEETING of this Division, to which the members of the other Divisions comprised in the old East Kent District (Ashford, Dover, Folkestone, and Thanet) were invited, was held on January 7th at the County Hotel, Canterbury. Dr. SIDNEY WACHER, Chairman of the Division, presided. Thirty members were present.

Cinematograph Demonstration.—An address and cinematograph demonstration on Some Characteristic Features of Nervous Diseases was given by Dr. WILFRED HARRIS. The cinematograph showed the gait, tremors, other movements and physical characteristics of an excellent series of nervous cases taken from the wards, etc., of some of the London hospitals. The meeting thus enjoyed from these life-like pictures a most excellent clinic on nervous diseases. Keen appreciation of the demonstration was shown by those present, and a hearty vote of thanks was accorded the lecturer.

Medical Inspection of School Children.—A discussion followed upon the report of the Medico-Political Committee of the Association upon certain points arising in connexion with the medical inspection of school children and the treatment of those found defective. On the treatment of defective school children the Canterbury and Faversham Division decided unanimously in favour of:

1. Payment per case.
2. (As to staff surgeons.) Of the motion of Dr. A. H. Williams (Watford and Harrow) printed in the report.
3. Of leaving to the school authorities the duty of ensuring that parents who can afford to pay for such treatment are compelled to do so.

Police Emergency Fees in Kent.—A letter was read from the Secretary of the South-Eastern Branch stating that "The Subcommittee of the Branch Council appointed to consider the question of police fees is to remain a standing subcommittee, and, in the event of a case occurring in which it seemed desirable to take legal advice, that this subcommittee should add to their number the Secretary of the Division in which the case occurred, and should then have power to consult the Solicitor of the Association, and take action if so advised."

Next Meeting.—The next meeting will be held at Faversham in March.

Luncheon.—The Chairman kindly entertained members at luncheon prior to the meeting.

Vote of Thanks.—A hearty vote of thanks was accorded Dr. Wachter for presiding and for his hospitality.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

The following appointments have been made at the Admiralty: Fleet Surgeon E. C. LOMAS, M.B., D.S.O., to the *President*, additional; for three months' course at West London Hospital, January 12th; Fleet Surgeon H. E. TOWNSEND, M.B., D.S.O., to the *President*, M.B., to the *Andromeda*, for the voyage home, undated; Staff Surgeon M. CAMERON, M.B., to the *Royal Arthur*, January 14th (since cancelled); Staff Surgeon W. K. HOPKINS, lent to the *Royal Arthur* for the voyage, January 15th.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

MAJOR R. J. BLACKHAM, D.P.H., late Special Sanitary Officer, Southern Command, has been appointed Divisional Sanitary Officer, 1st (Peshawar) Division, Northern Army of India.

Colonel C. S. WESTCOTT, C.M.C., who is serving in India, is directed to officiate as Principal Medical Officer, 5th (Mhow) Division.

INDIAN MEDICAL SERVICE.

COLONEL W. O'HARA, Madras, is appointed Principal Medical Officer, Burma Division.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

First London Territorial Division.—Surgeon Lieutenant-Colonel and Honorary Surgeon-Colonel R. F. C. S. Eng, from the Honorary Colony of the Eastern Command, Maidstone Companies, and the London District, London Companies Royal Army Medical Corps (Volunteers), is appointed to the Honorary Colony of the Division, with precedence as in the Volunteer Force, April 1st, 1908.

For attachment to Units other than Medical Units.—Surgeon-Lieutenant-Colonel F. W. GIBSON, from the Tyne Division (Electrical Engineers) Royal Engineers (Volunteers), to be Lieutenant-Colonel, with precedence as in the Volunteer Force, April 1st, 1908. EDGAR RED DATE Surgeon-Captain, 3rd Glamorgan Volunteer Rifle Corps) to be Captain, April 1st, 1908. The undermentioned Surgeon-Lieutenant-Colonels, and Honorary Surgeon-Colonels, from the 5th Volunteer Battalion, the Manchester Regiment, to be Lieutenant-Colonels with the honorary rank of Surgeon-Colonels, with precedence as in the Volunteer Force, dated April 1st, 1908. THOMAS FOUR, RONALD L. SPRAGG, Lieutenant H. A. C. HARRIS, from the Sussex and Kent Bearers Company, Royal Army Medical Corps (Volunteers), to be Lieutenant, with precedence as in the Volunteer Force, dated April 1st, 1908. Surgeon-Lieutenant-Colonel and Honorary Surgeon-Colonel W. M. NORRIS, from the 5th Battalion, the Manchester Regiment, to be Lieutenant-Colonel, with the honorary rank of Surgeon-Colonel, with precedence from August 20th, 1904, dated April 1st, 1908. Lieutenant A. H. GODWIN, from the 2nd West Lancashire Field Ambulance, to be Lieutenant, dated August 13th, 1908. JOHN W. BIND, to be Captain, dated September 14th, 1908. Lieutenant C. H. SEDGWICK, to be Captain, dated September 25th, 1908. Surgeon-Captain J. R. WILLIAMS, M.B., from the 6th Battalion, the Royal Welch Fusiliers, to be Captain, dated November 18th, 1908. Surgeon-Major HARRY LEGRÉ DE LEGRÉ, M.B., from the 4th Battalion, Alexandra, Princess of Wales's Own (Yorkshire) Regiment, to be Major, dated November 18th, 1908. Captain W. B. WILLIS resigns his commission, dated December 4th, 1908.

First East Anglian Field Ambulance.—Captain F. A. BROOKS, to be Major, November 30th, 1908.

Second London Field Ambulance.—Captain P. F. SHAW, to be Major, December 15th, 1908.

Second North Midland Field Ambulance.—Captain and Honorary Major H. W. PLANT (Retired List, Volunteers), to be Transport Officer, with the honorary rank of Major, June 28th, 1908.

First Northumbrian Field Ambulance.—Lieutenant FRANK HAWTHORNE, M.D., to be Captain, December 1st, 1908.

First Welsh Field Ambulance.—Surgeon-Major T. L. K. DAVIES, M.B., from the 6th Battalion, the Royal Welsh Fusiliers, to be Major, November 18th, 1908.

UNATTACHED LIST.

The undermentioned officers of Volunteer Corps are appointed to the Territorial Force, on the Unattached List, for service with the contingents of the Senior Division of the Officers' Training Corps as stated against their names in the ranks and in the precedence which they severally held as officers in the Volunteer Force, dated July 17th, 1908: Surgeon-Captain W. T. BROOKS, M.B. (1st Oxford University) Volunteer Battalion the Oxfordshire and Buckinghamshire Light Infantry, Oxford University, to be Captain, Surgeon-Lieutenant W. D. STRICKLAND, M.B. (1st Oxford University) Volunteer Battalion the Oxfordshire and Buckinghamshire Light Infantry, Oxford University, to be Lieutenant.

Captain H. WADDE, M.D., from the Edinburgh Company, Royal Army Medical Corps (Volunteers), to be Captain, for service with the Edinburgh University Contingent, Senior Division, Officers' Training Corps, October 8th, 1908.

The announcements in the *London Gazette* of November 6th, 1908, regarding the transfer of Surgeon-Major Hugh Ransom Bramwell, M.B., and Surgeon-Captain John Cromie, from the Tynemouth Royal Garrison Artillery (Volunteers) are cancelled.

ROYAL GARRISON ARTILLERY (VOLUNTEERS).

HONORARY ASSISTANT SURGEON W. H. COCKER, 5th Lancashire Regiment, is retired, under the conditions of paragraph 103, Volunteer Regulations, March 31st, 1908; he retains his rank and uniform.

ROYAL ENGINEERS (VOLUNTEERS).

SURGEON-MAJOR F. W. GIBSON, the Tyne Division (Electrical Engineers), to be Surgeon-Lieutenant-Colonel, March 31st, 1908.

VOLUNTEER RIFLES.

SURGEON-CAPTAIN J. SWANSON, 1st Volunteer Battalion the Highland Light Infantry, resigns his commission, March 31st, 1908.

CHANGES OF STATIONS.

The following changes of stations amongst the officers of the Army Medical Service have been officially reported to have taken place during December, 1908:

	FROM	TO
Colonel H. J. W. BARROW	Dalhousie	Lahore.
" J. G. HARWOOD, F.R.C.S. Edin.	Darjeeling	Calcutta.
" M. W. KERR, D.S.O.	Tidworth	India.
Lieut.-Col. R. W. FORD, D.S.O.	Aldershot	Gwalior.
" M. L. HEARN	Dublin	India.
" H. H. JOHNSTON, C.B., M.D.	Straits Settlements	Curragh.
" G. E. WESTON	Bombay	S. Command.
" C. E. FAUNCE	Tidworth	Gibraltar.
" J. J. C. DONNET	Saugor	Kamptee.
" G. E. HALE, D.S.O.	Murree	Rawal Pindi.
" S. POWELL, M.D.	Adershot	Secunderabad.
" M. L. HEARN	China	Irish Command.
" J. S. GREEN, M.B.	Hyderabad	Nasirabad.
" C. A. LANE, M.B.	Ceylon	Tidworth.
" H. CARR, M.D.	Nasirabad	Nasirabad.
" A. KENNEDY	Bachnari	Aden.
" H. P. G. ELKINGTON	Mhow	Jhansi.
" J. FALLON	Western Comd.	Preston.
" J. J. RUSSELL, M.B.	Irish Command.	Irish Command.
" A. L. F. BALE	Nowgong	Shillong.
Major F. J. MORGAN	Nasirabad	India.
" E. A. BURNSIDE	Multan	Mount Abu.
" M. P. C. HOLT, D.S.O.	Woolwich	Amboia.
" J. W. BULL, D.S.O.	Mullingar	Madras.
" J. C. WEIR, M.B.	Newcastle	Lucknow.
" J. GILVIN	London Dist.	India.
" W. HALLARD, M.B.	Chariar	Bellahdur.
" F. SMITH, D.S.O.	Murree	Rawal Pindi.
" E. MCK. WILLIAMS	Straits Settlements	Northern Comd.
" J. C. CONNOR, M.B.	Parkhurst	India.
" W. A. S. GRAHAM	Jubbulpore	Nowgong.
" D. D. SHANAHAN	Kilworth Camp	Secunderabad.
" F. J. WADE-BROWN	London Dist.	India.
" J. E. BROSIDEN	N. China	Bellahdur.
" N. FAULHUE, M.B.	Campbellpore	Mhow.
" N. TYACKO	Lahore	Southern Comd.
" E. W. SLAYER, M.B.	Glasgow	Bangalore.
" E. P. MOORE, M.B.	Murree	Rawal Pindi.
" T. P. JONES, M.B.	Hong Kong	London Dist.
" A. G. THOMPSON, M.B.	Cardiff	India.
" G. S. MANSFIELD, M.B.	Bombay	Eastern Comd.
" W. J. TAYLOR, M.B.	S. China	Bellahdur.
" R. W. LOUTHURST, M.B.	Eastern Comd.	Warley.
" D. J. COLLINS, M.B.	Pretoria	Wynberg.
" J. B. ANDERSON	Bareilly	Benares.
" E. S. CLARK, M.B.	Peshawar	Nasirabad.
" W. TIBBIS, M.B.	Eastern Comd.	Shoeburyness.
" A. E. MILLER	Wellington	"St. Thomas"
" J. P. SILVER, M.B.	Bombay	Scottish Comd.
" E. B. STEEL, M.B.	Nasirabad	Nasirabad.
" F. KIDDE, M.B.	Secunderabad	Wellington.
" E. C. HAYES	Ceylon	India.
" E. A. HOOPER, D.S.O.	Quebec	Eastern Comd.
" S. A. ARCHER	Devonport	India.
" M. P. CORKERY	Woolwich	India.
Captain T. H. M. CLARKE, C.M.G., D.S.O., M.B.	Lucknow	Southern Comd.
" B. WATTS	Fermoy	Campbellpore.

Captain J. D. G. Macpherson, M.B.	Alfredshot
G. B. Crisp	Alford
L. E. L. Parker	Woolwich
M. H. G. Fell	Trawsfaydd
N. J. C. Rutherford, M.B.	Eastern Comd.
F. J. Palmer	Dublin
W. R. Blackwell	Dublin
A. Chopping	Cheriat
O. W. A. Elmer	Limerick
B. F. Winata	Gaenabury
J. P. Adey-Curran	Bulford
G. Ford, M.B.	Richmond
F. S. Walker, F.R.C.S.I.	Irish Comd.

Hospitals and Asylums.

THE ROYAL EDINBURGH ASYLUM, MORNINGSIDES.
 The annual report for the year 1907 of this important private asylum is notable in that it contains the last annual report of Dr. Clouston as Physician-Superintendent. Appointed to this post in 1875, the institution has grown, under his capable hands, into one of the largest, best-appointed, and renowned of hospitals of its kind; New Craig House, the stately edifice on Craiglockhart Hill, and its adjoining villas, providing accommodation and possessing advantages probably unsurpassed by any similar institution in Europe, have been erected, and the West House has been entirely remodelled. The managers of the asylum, in their report, pay a well-deserved tribute to Dr. Clouston on his retirement, and assure him "of their high regards and esteem and their earnest wish that all good may attend him and his in the time to come," in which good wish we desire to join. On January 1st, 1907, there were 837 patients on the registers, and there remained on the last day of the year 743. The total cases under treatment during the year numbered 1,154, and the average number daily resident 731.7. During the year 317 cases were admitted, of whom 266 were first and 51 not-first admissions. The number of admissions was less by 100 than the previous year, this being due to the opening of Bangour Village Asylum, which received most of the patients from the Edinburgh Parish Council. Of the total admissions, 134 were private patients, of whom 13 were voluntary boarders. This is the largest number of private patients ever received at this asylum. Of the total admissions, in 86 the attacks were first attacks within three and in 61 more within twelve months of admission; in 60 not-first attacks within twelve months, and the remainder were either of more than twelve months' duration (102), or congenital cases (8) an admission. Only 54 of the total were in average health and condition on admission, their condition being indifferent or reduced in 249, and bad and very exhausted in 54. The admissions were classified according to the forms of mental disorder into: Mania of all kinds, 112; melancholia of all kinds, 126; secondary, senile, and organic dementia, 22; general paralysis, 40; acquired epilepsy, 9; and congenital or infantile defect, 8. With regard to the preponderance of melancholic cases, Dr. Clouston states that in congenital cases, and in the excited cases with depressed or melancholic, and reviewing the years of his office back to 1874, his statistics show that up to the year 1890 the number of melancholics had never touched that of the maniacal, the total number of melancholic cases up to that year equalling 40 per cent. of the whole. In 1900, however, the number of depressed cases exceeded those of the excited, and in the eighteen years since 1890 they have formed 46 per cent. of the whole. The year 1890, Dr. Clouston points out, was the year of the greatest evidence of affluence, and, in his opinion, the subsequent increase of the proportion of melancholic cases is accountable to the influence of that disorder. Of the probable etiological factors amongst the admissions the following are the principal assigned: Alcoholic intemperance in 46, or 14 per cent.; syphilis in 6; critical periods in 71; epilepsy in 9; previous attacks in 65; gross brain disease in 6; various bodily diseases and disorders in 20; and mental and moral stress in 19. Hereditary influences were present in 16, or just under 24 per cent., and congenital defect existed in 8. During the year 85 were discharged as recovered, giving a recovery-rate on the admissions of 26.3 per cent. as compared with the average for this institution of 38.5 per cent. Like all other asylums, Morningside shows a declining discharge-rate as recovered. Dr. Clouston believes that this is due to the different classes of patients now sent to asylums—there are more cases of the old, weakened, and paralysed class sent now than formerly. The average mean age for the years 1874-1894 was 39.5 years; that for 1898-1907 was 42.1 years, whilst in the same time the proportion of cases recorded as in weak and exhausted condition on admission has risen from 9.9 per cent. to 16.3 per cent. There were also 140 discharged as relieved and 103 as not improved, and during the year 83 died. These deaths give a death-rate on the average numbers resident of 7.2 per cent., as compared with 11.1 per cent. for the preceding year, or the average for this institution of 7.1 per cent. The deaths were due in 40 cases to cerebro-spinal diseases, including 27 deaths from general paralysis; in 21 to chest diseases, including 8 deaths from pulmonary tuberculosis, and in the remainder to general diseases including 1 death from general tuberculosis and 7 from senile decay. In all 10 deaths, or 12 per cent. of the total deaths, were due to tuberculous disease. There was no serious accident and the general health appears to have been good throughout the year.

SALOP AND MONTGOMERY COUNTY ASYLUM.

Lieutenant R. E. Todd, M.B., appointed on probation July 29th, 1907, is stationed in the London District.

The following Lieutenants, appointed on probation August 1st, 1908, are stationed as under: D. S. Buist, M.B., C. Ryles, M.B., S. McK. Saunders, H. Gall, and C. Clarke, M.B., Eastern Command; W. E. Marshall, M.B., and D. H. C. MacArthur, London District; V. E. Vaughan, M.B., and J. R. Jones, M.D., W. G. Wright, A. T. J. McCreery, M.B., C. G. Sherlock, M.D., C. H. O'Rourke, M.B., S. W. Kyle, M.B., and J. W. Lane, M.D., Irish Command; A. M. Pollard, T. B. Nicholls, M.B., H. Bevis, G. S. Parkinson, and F. H. Somers-Gardner, M.B., Southern Command; N. R. McNeill, M.B., T. J. Mitchell, M.B., and D. E. C. Pottinger, M.B., Scottish Command; A. R. Wright, M.B., and G. H. Stack, M.B., Aldershot Command; A. W. Byrne, M.B., Western Command.

Lieutenant R. O. Kelly, appointed on probation February 4th, 1908, is stationed at Aldershot.

On January 1st, 1907, there were in this asylum, according to the report of Dr. D. F. Rambant, the medical superintendent, 738 patients, and on December 31st, 1907, there were 754. In addition on the latter date there were 20 boarded at Abergavenny Asylum, 20 at Cotford Asylum, 55 at Morpeth Asylum, and 25 at Forden Workhouse, giving a total of 120 for whom proper accommodation was not available in the asylum of their own district. The total cases under treatment at the asylum during the year numbered 980, and the average number daily resident 791. During the year 197 were admitted, of whom 145 were first admissions, 40 readmissions, and 12 transferred from other asylums. Thus, 185 were direct admissions, and of these

the attacks were first attacks within three months of admission in 77, and within twelve months of admission in 16 more, not first attacks within twelve months in 47, within twelve months but unknown whether first attack or not in 17, and the remainder were either of more than twelve months' duration on admission, or of congenital origin (8). The total admissions were classified as to the several forms of mental disorder into: Mania of all kinds, 76; melancholia of all kinds, 24; senile and secondary dementia, 30; delusional insanity, 17; general and confusional insanity, 7; stupor, 5; cases of congenital and primary dementia, 1 each, and cases of congenital or infantile defect, 22. As to the supposed etiological factors in direct admissions, alcohol was assigned in 19, 18, or 9.7 per cent.; syphilis in 5; critical periods in 19; influenza in 6; nervous diseases in 11; other bodily affections in 8; child-bearing in 8; and mental stress in 25. An insane heredity was ascertained in 31, and congenital defect, not amounting to imbecility, existed in 6. During the year 71 were discharged as recovered, giving a recovery-rate on the direct admissions on 58.57 per cent., or of the recovered in the direct admissions of the direct admissions of 36.75 per cent. There were also 23 discharged as relieved, 15 removed under contract, 11 as not improved, and 3 not insane. During the year also 78 died, giving a percentage death-rate on the average numbers resident of 9.85, an improvement on the 14.12 per cent. of the previous year. The deaths were due in 27 to cases of cerebro-spinal disease, including 12 deaths from general paralysis; in 26 to chest diseases, including 12 deaths from pulmonary tuberculosis; in 3 to abdominal diseases; and the remainder to general diseases, including 5 deaths from old age and 2 from tuberculosis other than pulmonary. Thus almost 18 per cent. of the total deaths were due to tuberculous disease. All deaths were from natural causes, and no inquest was held during the year.

KESTEVEN COUNTY ASYLUM.

THE annual report of Dr. J. A. Ewan, the medical superintendent of this asylum, shows that there were 371 patients on the asylum registers on January 1st, 1907, and that there remained 373 at the end of the year. Of those remaining 225 were chargeable to the unions in the County of Kesteven, the rest being mostly chargeable to the Stoke of Peterborough and to West Ham. The total cases under treatment during the year numbered 522 and the average number daily resident 384. During the year 118 were admitted, of whom 56 were direct and 62 indirect admissions, and 2 statutory readmissions. Of the direct admissions, in 28 the attacks were first attacks within three and in 8 more within twelve months of admission; in 11 not-first attacks within twelve months of admission, and in the remainder the attacks, whether first attacks or not, were of more than twelve months' duration (6) or of congenital origin (5). The admissions were classified according to the several forms of mental disorders into: Mania of all kinds, 23; melancholia of all kinds, 14; senile and secondary dementia, 25; delusional insanity, 27; volitional insanity, 11; alternating insanity, 5; general paralysis and confusional insanity, 7 each; and insanity with epilepsy, 5; primary dementia, 3; stupor, 1; and cases of congenital or infantile defect, 24. As to etiological factors in the direct admissions, alcohol was assigned in 8, or 14 per cent.; syphilis in 1; critical periods in 13; nervous diseases in 5; other bodily diseases in 2; child-bearing in 5, and mental stress in 13. An insane heredity was ascertained in 11, and congenital defect, not amounting to imbecility, existed in 10. During the year 18 were discharged as recovered, giving a recovery-rate on the direct admissions of 31.03 per cent., or of recoveries on the direct admissions on the direct admissions of 48.48 per cent. There were also 6 discharged as relieved and 100 as not improved. 98 of these latter being patients retransferred to the London County Council's Asylum at Long Grove. There were also during the year 25 deaths, giving the death-rate of 6.51 per cent. of the average numbers resident. The deaths were due in 6 to cerebro-spinal diseases; in 8 to diseases of heart and blood vessels; in 3 to respiratory disease; in 2 to old age, and in 6 to general diseases, including 3 deaths from pulmonary tuberculosis. One case of suicide occurred, a young man drowning himself in the asylum pond.

THE WARNEFORD HOSPITAL FOR MENTAL DISEASES, OXFORD.

We are pleased to see from the annual report for 1907 that the Committee of this hospital for private patients, conducted by a board of governors who have no interest in the property, are able to announce another successful financial year, a balance of over £1,831 remaining in the hands of the treasurers at the end of the year. During the year 41 patients received aid from the charitable funds, as compared with 35 in 1905 and 32 in 1906. With regard to these cases, the committee, whilst by no means requiring that all the patients on the aided list should belong to the enurable class, are of opinion that it would be inadvisable to admit charity patients who are in a state of irreducible dementia, and have communicated their opinion to the trustees of the Warneford estates. From the report of the Medical Superintendent, Dr. James Neil, we see that on January 1st, 1907, there were in the hospital 88 certified patients and 3 voluntary boarders, making in all 91 under treatment. On December 31st, 1907, there were 99 certified patients and 2 voluntary boarders, making a total of 101. The total certified cases under treatment during the year numbered 128, and the average

number daily resident 95. During the year 40 certified cases were admitted and 5 voluntary boarders, giving the highest number of admissions for one year in the history of the hospital. Of the 40 certified patients 14 were transferred from other care. Excluding any reference to the following epitome to voluntary boarders, the attacks were first attacks in 18 of the 25 direct admissions, and also in 8 of the 14 transfers. As to duration of disorder among the direct admissions, the attacks were first attacks within three months of admission in 9, first attacks of more than three and less than twelve months in 3, of more than twelve months in 4, of unknown duration in 1, and not-first attacks of less than three months' duration in 6, and of unknown duration in 5. The total admissions, direct and indirect, were classified according to the forms of mental disorder into: Mania of all kinds and melancholia of all kinds, 11 each; senile and secondary dementia, 2; delusional insanity, 11; general paralysis, 2; and stupor and confusional insanity, 1 each. As to the probable etiological factors among the direct admissions, alcohol was assigned in only 1, venereal disease in none, critical periods in 5, mental stress in 14, and injury and bodily disease in 5. An insane heredity was ascertained in 9, and congenital mental defect existed in 1. During the year 10 were discharged as recovered, giving a recovery-rate on the admissions, exclusive of transfers, of 35.7 per cent., or of total recoveries on total admissions of 25 per cent., or of recoveries in the direct admissions on the direct admissions of 20 per cent. There were also 2 discharged as relieved and 7 as not improved. During the year there were 10 deaths, giving a percentage death-rate on the average number daily resident of 1.4. The deaths were due in 4 cases to general paralysis, in 1 each to exhaustion from mania, cardiac failure, acute bronchitis, uræmia, and intestinal obstruction, and in 1 to shock from a homicidal wound. In the latter case, in which the patient had been attacked and wounded by another patient with a knife whilst at dinner, the aggressor was committed for trial at the assizes, but was found unfit to plead and ordered to be detained during His Majesty's pleasure. The general health throughout the year appears to have been good, and the condition and management of the hospital were favourably commented upon by the visiting Commissioners in Lunacy.

GLAMORGAN COUNTY LUNATIC ASYLUM.

FROM the annual report for 1907 of Dr. David Fulay, appointed medical superintendent in place of Dr. Stewart, who died in 1906, we see that there were 1,703 patients in the asylum on January 1st, 1907, and that there were 1,716 on the last day of the year. The total cases under care during the year numbered 2,073 and the average number daily resident 1,709.3. During the year 370 cases were admitted, of whom 327 were first admissions, the admissions exceeding those of the previous year by 21. In 178 the attacks were first attacks within three and in 52 more within twelve months of admission; in 50 not-first attacks within twelve months of admission; and in the remainder, whether first attacks or not, the attacks were either of more than twelve months' duration on admission (69) or congenital cases (21). They were classified according to the forms of mental disorder into: Mania of all kinds, 195; melancholia of all kinds, 81; senile and secondary dementia, 19; general paralysis, 37; epileptic insanity, 17; and congenital or infantile defect, 21. The supposed etiological factors in direct admissions were assigned in the following numbers and proportion: Alcohol in 57, or 15.4 per cent.; venereal disease in 10; critical periods in 24; various bodily disease in 21; mental and emotional stress in 82; and in 116 no cause could be assigned. Hereditary influences were ascertained in 69, or 18.6 per cent., and congenital defect existed in 21. During the year 118 were discharged as recovered, giving a recovery-rate on the admissions of 33.4 per cent., as compared with the average for this institution of 30.1 per cent. During the year 193 died, giving a death-rate on the average numbers resident of 9.3 per cent., the average death-rate for this institution being 7.8 per cent. The deaths were due in 77 cases to cerebro-spinal diseases, including 46 deaths from general paralysis; in 61 to chest diseases, including 20 from pulmonary consumption; in 25 to abdominal diseases, and in 30 to general diseases, including 25 from old age. All deaths were due to natural causes, and no inquest was held during the year. Twelve cases of dæmoniac occurred during the year, of these 5 proving fatal; also 6 cases of influenza and 4 of erysipelas, but apart from these the general health of the patients was satisfactory.

STAFFORDSHIRE COUNTY LUNATIC ASYLUM.

THE annual report of Dr. W. F. Menzies, the medical superintendent of this asylum, which is situated at Cheddleton, near Leek, shows that on January 1st, 1907, there were 668 patients in residence, and on the last day of the year 709. The total cases under treatment during the year numbered 918, and the average number daily resident 683. All of these numbers show considerable increases on those of the previous year, and the excess of patients over provided accommodation, which amounted to 50 at the beginning of the year, rose to 91 at the end of the year. Fortunately the extensions were almost ready at the time of preparing the report. During the year 193 were admitted, as compared with 193 during the previous year. Of the total admissions, 230 were direct admissions, 19 indirect, and 1 a statutory readmission. As to the duration of disorder on admission, in 85 the attacks were first attacks within three, and in 34 more within twelve, months of admission; in 36 not-

first attacks within twelve months of admission; in 2 it was unknown whether first attacks or not, and the remainder were either of more than twelve months' duration on admission (55) or congenital cases (17). The admissions were classified according to the forms of mental disorder into: Mania of all kinds, 55; melancholia of all kinds, 53; senile and secondary dementia, 12; general paralysis, 21; insanity with epilepsy, 20; delusional insanity, 3; insanity with gross brain lesions, 5; confusional insanity, 6; primary dementia, 3; stupor, 2; acute delirium and volitional insanity, 1 each; and cases of congenital or infantile defect, 20. As to the probable causes of insanity, and regarding only the direct admissions, alcohol was assigned in 73, or 31.7 per cent.; acquired syphilis in 23 and congenital syphilis in 2; lead and other poisons in 10 and tuberculosis in 24. Critical periods were assigned in only 16, child-bearing in 25, and physiological defects and errors in 12. The mental disease was concomitant with diseases of the nervous system in 33 (excluding 18 cases of general paralysis), and with other bodily affections in 36. Mental stress was assigned as cause in 51, and in 2 no cause could be ascertained. An insane heredity was ascertained in 65, or 28.2 per cent., an epileptic heredity in 13, a neurotic heredity in 47, an alcoholic heredity in 93, and of eccentricity in marked degree in 2. During the year 75 were discharged as recovered, giving the recovery-rate on the direct admissions, and of recoveries in the direct admissions on the direct admissions, of 32.61 per cent.; 21 as relieved, and 4 as not improved. During the year 109 died, giving a death-rate on the average numbers resident of 15.96 per cent. The deaths were due in 41 to cerebro-spinal diseases, including 15 deaths from general paralysis; in 5 to chest diseases, excluding pulmonary tuberculosis; in 11 to abdominal diseases; in 7 to senile decay and 1 to marasmus; in 42 to general diseases, including 13 deaths from pulmonary tuberculosis and 10 from other forms of tuberculosis, and in 3 to suicide. Tuberculous disease thus accounted for 18.3 per cent. of the total deaths, when only principal causes are considered.

DORSET COUNTY ASYLUM.

In last year's report of this asylum mention was made of the small increase (3) in the number of county patients. This year, the medical superintendent, Dr. P. W. MacDonald, is able to announce an actual decrease of 18. The number of patients in the asylum on January 1st, 1907, including out-county and private patients, was 820, and on December 31st, 1907, 821. The total cases under treatment during the year numbered 965, and the average number daily resident 813. During the year 145 were admitted, the lowest number of admissions since 1901. Of these admissions 111 were direct and 34 indirect admissions, and as to duration of disorder on admission in the direct admissions, in 54 the attacks were first attacks within three and in 12 more within twelve months of admission; in 25 not first attacks within twelve months of admission, and the remainder, whether first attacks or not, were either of more than twelve months' duration (13) or congenital cases (7) on admission. The total admissions were classified according to the forms of mental disorder into: Mania of all kinds, 38; melancholia of all kinds, 37; senile and secondary dementia, 27; delusional insanity, 11; confusional insanity, 8; general paralysis, 5; insanity with epilepsy and primary dementia, 3 each; stupor, 1; and cases of congenital or infantile defect, 12. As to the probable etiological factors among the direct admissions, alcohol was assigned in 5, or 4.5 per cent.; syphilis in none; influenza in 7; critical periods in 30; mental instability in 9; and mental stress in 24. An insane heredity was ascertained in 34, or 30 per cent.; but, Dr. MacDonald says, if all collateral factors were added, there would be an inherited predisposition in a clear 50 per cent. The general type of admission was not favourable, and Dr. MacDonald estimated that of the recoverable cases formed less than 15 per cent. of the total admissions. During the year 44 were discharged as recovered, giving a recovery-rate on the direct admissions of 39.63 per cent., or of the recoveries in the direct admissions on the direct admissions of 37.83 per cent. The recovery-rate among the private patients gave a percentage of 54.5. There were also 7 discharged as relieved and 10 as not improved. During the year there were 83 deaths, giving a death-rate on the average numbers resident of 10.20 per cent., as contrasted with the average for this institution of 7.5 per cent. The reason for this high death-rate was assigned to Dr. MacDonald, the unusual number of deaths among the male patients in the early part of the year, the certified cause in almost every case being pneumonia, which at one time assumed the form of an epidemic. The 83 deaths were due in 15 to cerebro-spinal diseases, including 8 deaths from general paralysis; in 35 to chest diseases, including 18 deaths from pneumonia and 5 deaths from pulmonary consumption; in 9 to abdominal diseases, and in the remainder, with exception, to general diseases, including 13 deaths from senile decay.

GLASGOW DISTRICT MENTAL HOSPITAL, GARTLOCH.

THE eleventh annual report of the Gartloch Asylum shows that the character of the admissions is altering somewhat. The percentage which had been ill over a year on admission, were congenital imbeciles, or had been ill previously, was 64. Despite these unfavourable factors, the recovery-rate was high, being 39.6 per cent., which must be considered extremely satisfactory when it is added that a very large number of easily curable

cases are treated in the observation wards of the Duke Street Hospital without certification. Another point is that while the percentage of admissions under 30 years of age has remained almost stationary during the past ten years, the admissions between 30 and 50 have diminished, while those over 50 have increased. General paralysis seems to be increasing. About one-fourteenth of the asylum population is composed of general paralysis. These also bulk largely in the list of deaths. Thirty-three out of the total of 94 deaths were due to general paralysis. Sanatorium treatment of tuberculous cases has reduced the percentage of deaths from tubercle very materially, from 19 per cent. to 11 per cent.

Dr. Parker continues to find in alcohol the chief factor in the causation of insanity. The influence of parental alcoholism is particularly seen in the adolescent admissions. Thus he finds a history of parental drunkenness in 76 per cent. of the admissions under 26 years of age, while in those of 26 years of age it was obtainable in 39.7 per cent. The most important of the other factors were ill-health, syphilis, adolescence, and senility.

WESTERN INFIRMARY, GLASGOW.

THE thirty-fourth annual report contains few striking features. The number of patients attending the outdoor departments amounted to 33,893, against 29,524 in the previous year, while the indoor patients increased from 7,556 to 8,090. The average daily number of indoor patients was 241.55, a slight decrease from the previous year, when the figures were 243.57, and similarly the average period of residence diminished, from 26.26 to 24.45 days. The number of deaths was 542, or 7.20 per cent. of all cases treated to a termination. Of the fatal cases, 147 were so hopeless that they died within forty-eight hours of admission. If these are deducted the mortality falls to 5.35 per cent. A small increase of £153 in the ordinary income is more than counterbalanced by the increase of ordinary expenditure, which amounts to £2,463. The steadiness of the ordinary income is rather remarkable, considering the prevailing commercial and industrial depression. It is largely due to the fact that in the past year the area has been extended from which both general and employees' subscriptions are derived. The new income from these sources amounted to £337 13s., and the total ordinary income from all sources was £22,767. The total ordinary expenditure was £37,742. To meet this deficit the extraordinary income was drawn upon to the extent of nearly £15,000, but after meeting this and other extraordinary expenses there remained at the credit of extraordinary income a balance of £1,589.

The average cost per patient was £4 13s. 3d., as against £4 16s. 1d. in the year immediately preceding. The cost of each bed, fully occupied, was larger, however—£69 11s., against £66 15s. 6d. Notwithstanding the large addition to the number of patients, the annual expenditure only increased by £1,451.

A further building extension is apparently required. Although the accommodation was recently increased by 10 beds, it is still far from being adequate to meet the growing demand for admission. Plans have been prepared for such extension involving a cost of at least £80,000; towards this sum about £35,000 has been paid or promised, but the managers do not propose to commence the extension till the whole sum required has been subscribed. It is intended that this proposed extension will be final, as the plans cover all the ground available for building purposes.

At present a large addition is being made to the accommodation for nurses. Between 40 and 50 bedrooms are being added to the Home.

NEWPORT COUNTY BOROUGH ASYLUM, CAERLEON.

FROM the annual report of Dr. W. F. Nelis, the medical superintendent of this asylum, for the year 1907 (the second annual report), we see that on January 1st, 1907, there were 388 patients in the asylum, and on the last day of the year 361. The total cases under care during the year numbered 412, and the average number daily resident 346. During the year 74 were admitted, of whom 56 were direct admissions and 18 indirect admissions. The attacks were first attacks within three and in 8 more within twelve months of admission; in 17 in 17 not first attacks within twelve months of admission; in 15, whether first attacks or not, of more than twelve months' duration on admission, and 2 were congenital cases. On the whole, Dr. Nelis says, the admissions were of unfavourable character as regards recovery, and also an unusually large proportion were physically broken down. They were classified according to the forms of mental disorder into: Mania of all kinds, 43; melancholia of all kinds, 9; secondary, senile, and organic dementia, 8; general paralysis, 7; acquired epilepsy, 1; and congenital or infantile defect, 6. The supposed etiological factors were assigned in the following numbers and proportions: Alcohol in 10, or 13.5 per cent.; venereal disease in 1, critical periods in 6; ill-health in 18, domestic trouble in 4, and adverse circumstances in 2. Hereditary influences were ascertained in 16, or 21.6 per cent., and congenital cases existed in 2. During the year 24 were discharged as recovered, giving a recovery-rate on the admissions of 32.5 per cent., 6 as relieved, and 5 as not improved. During the year, also, there were 16 deaths, giving a death-rate on the average numbers resident of 4.6 per cent. The deaths were due in 5 cases to general paralysis, in 2 to cerebral softening, in 3 to heart disease, in 1 to chronic nephritis, and in 5, or 31 per cent. of the total deaths, to phthisis pulmonalis. All of those who died of phthisis were suffering from the complaint on admission.

Vital Statistics.

VITAL STATISTICS OF LONDON DURING THE FOURTH QUARTER OF 1908.

[SPECIALLY REPORTED FOR THE BRITISH MEDICAL JOURNAL.]

IN the accompanying table will be found summarized the vital statistics of the City of London and of each of the metropolitan boroughs, based upon the Registrar-General's returns for the fourth quarter of the year. The mortality figures in the table relate to the deaths of persons actually belonging to the various boroughs, and are obtained by distributing the deaths occurring in institutions among the several boroughs in which the deceased persons had previously resided. The 30,434 births registered in London during the three months under notice were equal to an annual rate of 23.6 per 1,000 of the population, estimated at 4,795,757 persons in the middle of 1908; in the corresponding periods of the three preceding years the birth-rates were 26.1, 25.5, and 24.4 per 1,000 respectively, the average rate for the fourth quarter of the ten years, 1898-1907, being 27.1 per 1,000. Among the several boroughs the birth-rates last quarter ranged from 15.0 in Hampstead, 16.4 in Westminster, 15.9 in the City of London, 16.0 in Paddington, 16.8 in Chelsea, and 17.7 in Stoke Newington, to 28.0 in Poplar, 29.4 in Bethnal Green, 30.0 in St. Marylebone, 30.2 in Stepney, 31.5 in Bermondsey, and 33.5 in Finsbury.

During the quarter under notice 17,615 deaths of London residents were registered, equal to an annual rate of 13.7 per 1,000, against 16.2, 15.4, and 14.3 per 1,000 in the four quarters of the three preceding years; for the corresponding period of the ten years 1898-1907 the average death-rate was 16.8 per 1,000. The death-rates last quarter ranged from 8.7 in Hampstead, 10.5 in Lewisham, 10.9 in Woolwich, 11.5 in Paddington and in Wandsworth, and 11.7 in Battersea, to 16.5 in Southwark, 16.9 in Bethnal Green, 17.1 in Shoreditch and in Stepney, 19.0 in Bermondsey, and 19.1 in Finsbury.

The 17,615 deaths from all causes last quarter included 1,509 which were referred to the principal infectious diseases; of these 453 resulted from measles, 136 from scarlet fever, 225 from diphtheria, 50 from whooping-cough, 115 from enteric fever, and 585 from diarrhoea. These 1,609 deaths were equal to an annual rate of 1.25 per 1,000, or 0.27 per 1,000 less than the average rate from the same diseases in the corresponding quarter of the ten preceding years. No death from any of these diseases was recorded last quarter in the City of London; among the metropolitan boroughs the lowest rates therefrom were 0.40 in Hampstead, 0.65 in Westminster, 0.70 in Lewisham, 0.73 in Paddington and in St. Pancras, 0.74 in Wandsworth, and 0.76 in Camberwell; the highest rates were 1.70 in Lewisham, 1.75 in Shoreditch, 2.10 in Finsbury, 2.63 in Stepney, 2.64 in Bethnal Green, and 2.74 in Bermondsey. The greatest proportional mortality from measles was recorded in St. Marylebone, Islington, Finsbury, Bethnal Green, Stepney, Southwark, and Bermondsey; from scarlet fever in Stoke Newington, Hackney, Shoreditch, Bethnal Green, Stepney, Poplar, and Bermondsey; from diphtheria in Fulham, Chelsea, Islington, Shoreditch, Stepney, Lewisham, and Woolwich; from whooping-cough in Paddington, Chelsea, Finsbury, Shoreditch, and Bethnal Green; from enteric fever in Chelsea, Stoke Newington, Holborn, Finsbury, Shoreditch, Bethnal Green, Bermondsey, and Greenwich; and from diarrhoea in Finsbury, Stepney, Southwark, Bermondsey, Deptford, and Lewisham.

During the three months ending December last the deaths from phthisis among persons belonging to London numbered 1,744, and were equal to an annual rate of 1.35 per 1,000, against 1.30 and 1.29 in the four quarters of the three preceding years. The death-rates from this disease last quarter ranged from 0.74 in Lewisham, 0.81 in Paddington, 0.92 in Hampstead, 1.00 in Kensington, 1.02 in Woolwich, and

1.08 in Deptford, to 1.78 in Bermondsey, 1.97 in Shoreditch, 2.02 in Southwark, 2.05 in Holborn, 2.06 in Finsbury, and 2.32 in the City of London. Infant mortality, measured by the proportion of deaths among children under 1 year of age to registered births, was equal to 123 per 1,000 last quarter, against 130, 122, and 131 in the corresponding quarters of the three preceding years. The lowest rates last quarter were recorded in St. Marylebone, Hampstead, Stoke Newington, Holborn, Lambeth, and Woolwich, and the highest rates in Hammersmith, Finsbury, Shoreditch, Stepney, Southwark, Bermondsey, and Deptford.

HEALTH OF ENGLISH TOWNS.

IN seventy-six of the largest English towns, including London, 8,495 births and 5,237 deaths were registered during the week ending Saturday last, January 16th. The annual rate of mortality in these towns, which had been 18.2 and 17.5 per 1,000 in the two preceding weeks, further fell last week to 16.6 per 1,000. The rates in the several towns ranged from 4.9 in Hornsey, 8.5 in Coventry, 8.9 in King's Norton, 9.9 in Walsley, 10.3 in Walsley, 10.4 in Aston Manor, 10.5 in Derby, and 10.7 in Stockton-on-Tees, to 20.0 in West Bromwich and in Manchester. 23.4 in Tynemouth, 24.4 in Great Yarmouth, 24.6 in Merthyr Tydfil, 24.7 in Oldham, 26.2 in Sunderland, and 27.3 in Bury. In London the rate of mortality was 16.9 per 1,000, which is 1.6 per 1,000 less in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.6 per 1,000 in the seventy-six towns; in London the rate from these diseases was equal to 1.5 per 1,000, while among the seventy-five other large towns they caused rates ranging upwards to 2.9 in West Ham, in Great Yarmouth, and in Oldham, 3.0 in West Bromwich, in Smethwick, and in Manchester, 3.3 in Merthyr Tydfil, 3.6 in Sunderland, and 4.8 in Rotherham. Measles caused a death-rate of 2.2 in Willesden, 2.3 in Great Yarmouth, in Middlesbrough, and in Merthyr Tydfil, 2.2 in Warrington, 2.5 in Leicester and in Sunderland, and 4.0 in Rotherham; diphtheria of 1.4 in East Ham and in Grimsby; whooping-cough of 1.5 in West Bromwich; "fever" of 1.1 in Oldham; and diarrhoea of 1.5 in Smethwick. The mortality from scarlet fever showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The number of scarlet fever cases remaining under treatment in the Metropolitan Asylum Hospitals and the London Fever Hospital, which had been 3,464, 3,557, and 3,347 at the end of the three preceding weeks, had further declined to 3,261 at the end of last week; 358 new cases were admitted during the week, against 303, 379, and 323 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

DURING the week ending Saturday last, January 16th, 915 births and 643 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 18.3 and 19.5 per 1,000 in the two preceding weeks, declined again to 18.1 per 1,000 last week, but was 1.5 per 1,000 above the average rate in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 12.2 in Leith and 15.2 in Greenock to 25.9 in Dundee and 26.4 in Perth. The death-rate from the principal infectious diseases averaged 2.0 per 1,000 in the eight towns, the highest rates being recorded in Glasgow and Aberdeen. The 295 deaths registered in Glasgow included 3 which were referred to scarlet fever, 6 to diphtheria, 27 to whooping-cough, 2 to enteric fever, and 4 to diarrhoea. Three fatal cases of scarlet fever were recorded in Edinburgh; 2 of whooping-cough and 3 of diarrhoea in Dundee; 3 of measles, 2 of scarlet fever, and 4 of whooping-cough in Aberdeen; and 3 of whooping-cough in Paisley and 2 in Greenock.

Analysis of the Vital Statistics of the Metropolitan Boroughs and of the City of London after Distribution of Deaths occurring in Public Institutions during the Fourth Quarter of 1908.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, January 16th, 655 births and 468 deaths were registered in the twenty-two principal urban districts of Ireland as against 655 births and 446 deaths in the preceding period. The annual death-rate in these districts, which had been 18.3, 24.7, and 20.4 per 1,000 in the three preceding weeks, rose to 21.4 per 1,000 in the week under notice, this figure being 4.8 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 23.7 and 19.3 respectively, those in other districts ranging from 8.0 in Dundalk and 9.6 in Sligo to 45.5 in Lisburn and 49.1 in Kilkenny, while Cork stood at 20.5, Londonderry at 15.7, Limerick at 16.4, and Waterford at 9.7. The zymotic death-rate in the twenty-two districts averaged 1.4 per 1,000, as against 1.2 per 1,000 in the preceding period.

CENTRAL MIDWIVES BOARD.

A SPECIAL meeting of the Central Midwives Board, under the provisions of Rule D 5, was held at Caxton House, Westminster, on January 14th, with Dr. F. H. CHAMPEYNS in the chair.

Midwife Censured.

The following charges alleged against Maria Booth were considered:

That having been engaged to attend as a midwife at a confinement, and being actually in attendance on July 20th, 1908, and on July 22nd, the patient suffering from hæmorrhage, she (the midwife) did not explain that the case was one in which the attendance of a registered medical practitioner was required, nor did she hand to the husband or the nearest relative or friend present the form of sending for medical help, properly filled up and signed by her, as required by Rules E 18 and 19; that she did not wash the patient at any time; that she did not take the patient's temperature at any time; that a registered medical practitioner having been sent for on July 25th, she did not await his arrival or faithfully carry out his instructions as required by Rule E 6.

The Board censured Maria Booth, and directed that a report of her conduct should be furnished by the local supervising authority in three months' time.

Midwife Struck off the Roll.

The following charges alleged against Catherine Walls were considered:

That on August 30th, 1908, she was drunk when on duty at 23, Trinity Place, Windsor; that on September 15th, 1908, she was drunk when on duty proceeding to attend a patient at Bracknell; that she was habitually given to drinking to excess.

The Board directed the name of Catherine Walls to be struck off the Roll of Midwives.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column, advertisements must be received not later than the first post on Wednesday morning.

VACANCIES.

BIRKENHEAD BOROUGH HOSPITAL.—Junior Resident House-Surgeon (Male). Salary, £80.
BRIDGWATER HOSPITAL.—House-Surgeon. Salary at the rate of £80 per annum.
BRISTOL GENERAL HOSPITAL.—Senior House-Surgeon. Salary, £120 per annum.
BRISTOL ROYAL INFIRMARY.—(1) Two House-Physicians; (2) House-Surgeon; (3) Obstetric and Ophthalmic House-Surgeon; (4) Throat and Nose and Ear House-Surgeon; (5) Casualty Officer. Salary for (1) and (2) £100 each, (3) and (4) £75, and for (5) £50.
BUXTON: DEVONSHIRE HOSPITAL.—Assistant House-Surgeon. Salary, £70 per annum.
CANCER HOSPITAL, Fulham Road, S.W.—Three Clinical Assistants.
CHELSEA HOSPITAL FOR WOMEN, Fulham Road, S.W.—Pathologist. Honorarium, £40 per annum.
CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, N.E.—House-Physician (male). Salary at the rate of £50 per annum.
DUDLEY: GUEST HOSPITAL.—Senior Resident Medical Officer. Salary, £100 per annum.
DURHAM COUNTY ASYLUM.—Junior Assistant Medical Officer. Salary, £150 per annum.
EDINBURGH UNIVERSITY.—Additional Examiner in Forensic Medicine.
EVELINA HOSPITAL FOR SICK CHILDREN, S.E.—House-Surgeon. Salary at the rate of £60 per annum.
FULBOURN LUNATIC ASYLUM.—Senior Assistant Medical Officer (Male). Salary, £150 per annum.
GORDON HOSPITAL FOR FISTULA, Vauxhall Bridge Road, S.W.—Resident House-Surgeon.
HOSPITAL FOR DISEASES OF THE SKIN, Stamford Street, S.E.—Clinical Assistant.
LANGHOE EPILEPTIC COLONY.—Medical Superintendent.

MACCLESFIELD GENERAL INFIRMARY.—Junior House-Surgeon. Salary, £50 per annum.
MERTHYR TYDFIL BOROUGH.—Medical Inspector of School Children. Salary, £20 per annum, increasing to £30.
MILLER GENERAL HOSPITAL, Greenwich Road, S.E.—Junior House-Surgeon. Salary at the rate of £80 per annum.
NORTHAMPTON GENERAL HOSPITAL.—Senior Resident Medical Officer. Salary, £120 per annum.
NORTHUMBERLAND HOUSE, Finsbury Park, N.—Male Assistant Officer. Salary, £120 per annum.
PAISLEY INFECTIOUS DISEASES HOSPITAL.—Assistant Medical Officer. Salary, £100 per annum.
POPULAR HOSPITAL FOR ACCIDENTS, E.—Assistant House-Surgeon. Salary at the rate of £30 per annum.
RATCHER HILL CONSUMPTION SANATORIUM.—Resident Medical Officer (Female). Salary, £100.
ROTHERHAM HOSPITAL AND DISPENSARY. Senior House-Surgeon. Salary, £110 per annum.
ROYAL HOSPITAL FOR DISEASES OF THE CHEST, City Road, E.C.—House-Physician. Salary at the rate of £60 per annum.
ST. MARYLEBONE GENERAL DISPENSARY, Welbeck Street, W.—Honorary Obstetric Physician.
SALISBURY INFIRMARY.—Assistant House-Surgeon. Salary, £50 per annum.
SAMARITAN FREE HOSPITAL FOR WOMEN, Marylebone Road, N.W.—Clinical Assistants.
WEST END HOSPITAL FOR DISEASES OF THE NERVOUS SYSTEM, Welbeck Street, W.—Resident House-Physician. Salary at the rate of £100 per annum.
WEST LONDON HOSPITAL, Hammersmith Road, W.—(1) Assistant Ophthalmic Surgeon; (2) Pathologist. Salary, £200 per annum.

APPOINTMENTS.

BIGGS, George Nixon, M.B., B.S.Durh., Aural Surgeon to the Evelina Hospital for Sick Children.
BROWN, W. Brodie, M.B., C.M.Aberd., Medical Officer and Public Vaccinator for the Parish of Lumphannan.
CHEESMAN, E. R. R., L.S.A., District Medical Officer of the Shaftesbury Union.
CREW, F. D., M.R.C.S., L.R.C.P., Medical Officer of Health, Borough of Higham Ferrers.
CROOK, D. H., M.R.C.P. Edin., Certifying Factory Surgeon for the Edinburgh District, co. Edinburgh.
CROWTHER, Sydney Nelson, M.R.C.S., L.R.C.P., Senior Assistant Medical Officer, Surrey County Asylum, Netherne, near Merstham.
D'AMICO, C. De P., M.D.Malta, M.R.C.S., L.R.C.P., Resident Assistant Medical Officer of the Camberwell Parish Infirmary.
DAVE, J. A., M.B., Certifying Factory Surgeon for the Forgue District, co. Aberdeen.
DICKSON, L. E., M.D., District and Workhouse Medical Officer of the Bridgton Union.
DYDES, D. G., M.B., Medical Officer of Health, Martley Rural District.
GENT, W. C., L.R.C.P. and S. Edin., District Medical Officer of the Droitwich Union.
GIBBS-SMITH, E. G., L.R.C.P.I., D.P.H., Medical Officer of Health, Teddington Urban District.
GENTHER, Hermann, M.B.Lond., Medical Officer of Health, Hampton Wick Urban District.
HALL, C. R. F., M.A., B.C.Camb., M.R.C.S., L.R.C.P., District Medical Officer of the Abernethy Union.
HANNA, H. M.A., B.Sc., B.Ch., R.U.L., Assistant Surgeon to the Ulster Eye, Ear, and Throat Hospital, Belfast.
HAWESLEY, W. L., M.B., Ch.B., D.P.H., School Medical Officer to the City of Liverpool Education Committee.
HOWARD, Russell, M.S., F.R.C.S., Surgeon to the Poplar Hospital.
LUTHER, E. L., M.D.Dub., B.Ch., District Medical Officer of the Dorchester Union.
MASON, E. R. F., L.R.C.S., L.R.C.P. Edin., Medical Officer of Health, General Rural District.
PAIN, B. H., M.B., C.D., District Medical Officer of the Epsom Union.
PEGH, W. T. G., M.D., Medical Superintendent of the Children's Infirmary, Carlshamton.
REARDON, J. C. P., L.R.C.P. and S. Ed., Certifying Factory Surgeon for the Kinghorn District, co. Fife.
RELTON, C. D., M.B., B.S.Durh., District Medical Officer of the St. Thomas's Union.
ROBERTSON, A. S., M.B., C.M.Glas., District Medical Officer of the Peterborough Union.
ROSE, A., M.B., C.M., District Medical Officer of the Bolton Union.
ROSE, E. F., L.S.A., L.M.S.S.A., Medical Officer of Health, Swaffham Rural District.
RYGATE, D. J., L.R.C.P., M.R.C.S., District Medical Officer of the Wilton Union.
SANDFORD, D. S., M.R.C.S., L.R.C.P., Medical Superintendent of the St. George's Hospital Infirmary and Fulham Road Workhouse.
SMITH, E. P., M.R.C.S., L.R.C.P., District Medical Officer of the Bromsgrove Union.
SYMMONS, G. H. H., M.D. Edin., Honorary Physician to the Hereford General Hospital.
TATE, E., M.B., B.S.Durh., District Medical Officer of the Castle Ward Union.
TOLPITT, P. T., L.R.C.P. and S. Edin., L.F.P.S.Glas., Medical Officer of Health, Nayland Urban District.
TROTTER, G. Clark, M.D. Edin., D.P.H. Aber., Medical Officer of Health, Paisley.
TYLCOATE, Frank Edward, M.D., D.P.H., Ch.H.Viet., M.R.C.P. Lond., Resident Medical Officer to the Manchester Royal Infirmary.
WELLS, J. D., M.B., Ch.B. Edin., Medical Officer of Health, Billericay Rural District.
WESTROPE, L. L., M.B.Durh., District Medical Officer of the Gateshead Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 3s. 6d., which sum should be forwarded in post-office orders or stamps with the notice not later than Wednesday morning, in order to ensure insertion in the current issue.

DEATHS.

COLLAND.—On January 16th, at Sheerness, John Brightman Colland, M.R.C.S., L.R.C.P. Lond., aged 29.

MCCARTHEAN.—January 14th, at 137, North Esplanade, Deal, Janie Turnbull Taylor, wife of John McCartean, M.D., L.S.O., late of H.M. Prison, Perth. The only infant.

NOBLE.—On January 16th, at 167, Kennington Park Road, S.E., James Black Noble, M.R.C.S., L.R.C.P., aged 50.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, Cavendish Square, W., 8.30 p.m., Papers.—(1) Dr. Conroy Berkeley, Warrington's Panhysterectomy for Carcinoma; (2) Mr. W. F. Brook (Swansea), A Preliminary Note on the Relationship of Delayed Union in Fractures to Deficiency of Calcium Salts in the Blood.

ROYAL SOCIETY OF MEDICINE:

ODONTOLOGICAL SECTION, 20, Hanover Square, 8 p.m.—(1) Annual General Meeting, Election of Officers. (2) Communication: Mr. Philip Turner, The Treatment of a Denture Swallower by Means of Killian's Oesophagus by Means of Swilled or Killion's Oesophagus Tubes. (3) Paper: Mr. Charles H. Clark, Radiographs of the Teeth and Associated Parts (illustrated by the epididymoscope).

TUESDAY

ROYAL SOCIETY OF MEDICINE: MEDICAL SECTION, 20, Hanover Square, 5.30 p.m.—Discussion on Ulcerative Colitis, to be opened by Sir William Alcock, M.D.

THURSDAY.

OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM, 11, Chandos Street, Cavendish Square, W.—8 p.m., Card Cases. 8.30 p.m., Papers.—1. Mr. N. Bishop Hartman: (1) Four Generations of Lamellar Cataracts: (2) An Unusually Rapid Development of Complete Cataract in a Boy. 2. Mr. David J. Wood: A Case of Retinal Exudation with Extreme Distension of Vessels and numerous Arterio-venous Anastomosis. 3. Mr. A. S. Percival: (1) Note on the Colours of Benham's Top. (2) Note on Some Rhythmic Oscillations of the Pupil.

POST-GRADUATE COURSES AND LECTURES.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.—Wednesday, 4 p.m., Cases from the Wards.

LONDON SCHOOL OF CLINICAL MEDICINE.—Daily arrangements: Out-patient Demonstrations, 10 a.m.; Medical and Surgical Clinics, 2.15 p.m. and 3.15 p.m. respectively; Operations, 2 p.m. Special Clinics: Ear and Throat, at noon and 4 p.m., Monday, and noon, Thursday; Skin, at noon and 4 p.m., Tuesday, and noon, Friday; Eye, 11 a.m., Wednesday and Saturday; Radiography, 4 p.m., Thursday. Special Lectures: Monday, 4 p.m., Hay Fever; Tuesday, 3.15 p.m., The Operative Treatment of Gall Stones; Friday, 2.15 p.m.

LONDON THROAT HOSPITAL, Great Portland Street, W.—Wednesday, 5 p.m., Briening's Bronchoscope.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chancery Street, W.C.—The following clinical demonstrations have been arranged for next week at 4 p.m. each day: Monday, Skin; Tuesday, Medical; Wednesday, Surgical; Thursday, Surgical; Friday, Eye. Lectures at 5.15 p.m. each day will be given as follows: Monday, Some Surgical Considerations; Tuesday, Otic Neuritis; Wednesday, Some Medical Considerations; Thursday, Rupture of Perineum.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.—Tuesday, 3.30 p.m., The Significance of Focal Fits; Friday, 3.30 p.m., Clinical Lecture.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales General Hospital, Tottenham, N.—Monday, Clinics, 10 a.m., Surgical Out-patient, 2.30 p.m., Medical Out-patient; Nose, Throat, and Ear: X Rays; 4.30 p.m., Medical In-patient. Tuesday, 10 a.m., Medical Out-patient; Clinics; 2.30 p.m., Operations; Wednesday, Gynaecological; 4.30 p.m., Lecture: Dermatological Inspection of School Children. Wednesday, 2.30 p.m., Medical Out-patient, Skin, and Eye Clinics. Thursday, 2.30 p.m., Gynaecological Operations; Clinics; Medical Out-patient, Surgical Out-patient, X Rays; 3 p.m., Medical In-patient; 4.30 p.m., Special Demonstration of Cases of Children's Disease. Friday, Clinics; 10 a.m., Surgical Out-patient; 2.30 p.m., Operations; Clinics; Medical Out-patient, Eye; 3 p.m., Medical In-patient.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith Road, London, W.—The following are the arrangements for next week:—Daily, 2 p.m., Medical and Surgical Clinics, X rays; 2.30 p.m., Operations. Monday and Thursday and Wednesday and Saturday, 2 p.m., Diseases of the Eyes. Tuesday and Friday, 10 a.m., Gynaecological Operations; 2 p.m. (and Wednesday and Saturday, 10 a.m.), Diseases of Throat, Nose, and Ear; 2.30 p.m., Diseases of the Skin. Wednesday and Saturday, 10 a.m., Diseases of Children; 2.30 p.m., Diseases of Women. Lectures: At 10 a.m., Monday and Thursday, Surgical Histology. Registrar, Demonstration of Surgical Cases; Friday, Medical Registrar, Demonstration of Medical Cases. At 12 noon, Pathological Demonstration. At 12.15 p.m., Practical Medicine. At 5 p.m., Monday, Diseases of Throat, Nose, and Ear. Clinical Lecture. Tuesday, Ankylostomiasis. Wednesday, Medicine. Thursday, Anaesthetics. Friday, Cases of Skin Diseases.

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, Leicester Square, W.C.—Thursday, 6 p.m., Syphilis.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

The British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. Od., and the **BRITISH MEDICAL JOURNAL** is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association, and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the **BRITISH MEDICAL JOURNAL** for non-members is £1 8s. Od. for the United Kingdom, and £1 15s. Od. for abroad

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BIRMINGHAM BRANCH.

An ordinary meeting was held at the Medical Institute on January 14th. Mr. F. MARSH, the President, was in the chair, and thirty-three members were present.

Coventry Provident Dispensary.—Dr. THOMAS WILSON proposed, Dr. KIRBY seconded, and it was carried unanimously:

That the sum of five guineas from the members' fund be voted to the testimonial fund to the late medical officers of the Coventry Provident Dispensary.

Operative Treatment of Oblique Inguinal Hernia.—Mr. JORDAN LLOYD read a paper upon the operative treatment of oblique inguinal hernia. He thought the description, "radical cure," to be a misnomer. The following points were fully discussed: When are curative operations expedient? The important points in anatomy, the method of operating, the choice of suture material, the after-treatment, the results, and, finally, recurrence and its prevention. The paper was discussed by Drs. DEANESLY and PLUMMER, and Messrs. GEORGE HEATON, J. T. J. MORRISON, and LEEDHAM GREEN. Mr. JORDAN LLOYD replied.

METROPOLITAN COUNTIES BRANCH: CHELSEA DIVISION.

A MEETING was held at the Chelsea Town Hall on Tuesday, January 12th. In the temporary absence of Dr. PARSONS, Dr. O'SULLIVAN took the chair.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

An Ethical Matter.—A letter was read from a practitioner, in reply to one which the Secretary had sent him according to instructions received at the last Divisional meeting and reported in the minutes thereof. The explanation was considered satisfactory.

Election of Representative for the Annual Representative Meeting.—A letter was read from the Central Office, advocating the earlier election of a Representative, and it was decided that the matter should receive consideration at the next meeting.

Medical Inspection of School Children.—A letter was received from the St. Pancras Division with reference to the medical inspection of school children, and it was ordered to be laid on the table.

Council of the Royal College of Surgeons of England.—It was proposed by Dr. KEEN (in the absence of Dr. Bonney), and seconded by Dr. LINDSAY:

That we, the Chelsea and Fulham Division of the Metropolitan Counties Branch of the British Medical Association, deeply regret and resent the action of the Council of the Royal College of Surgeons of England in that, having ascertained the wishes of a majority of the Fellows and Members of their College, they should deliberately flout that opinion in the recent alteration of their by-laws; and that a copy of this resolution should be sent to the other Divisions of the British Medical Association.

Carried *nem. con.*

Intrauterine Wounds of Fetal Head.—Dr. JAMES HAMILTON read a paper on this subject, and related two cases. He said his chief object was to induce other members of the Branch to bring forward interesting cases which were constantly occurring in general practice, and thus make their meetings more interesting practically. The two cases recorded below, of contused or abraded wounds of the scalp occurring previously to birth, were, he

thought, unique: they also illustrated the old well-known rule that rare accidents or abnormalities came in runs. Twenty-two years ago he had two cases of imperforate anus in one week, and had not seen a similar deformity since, although he had during that time attended about 2,000 confinements.

CASE I.—Mrs. B., confined in April, 1908. Baby just born as Dr. Hamilton entered the room, and the nurse had only preceded him by about a minute, so that no digital examination had been made. While attending to the mother, who had some hæmorrhage after expressing the placenta, the nurse, who was washing the baby, asked him to look at its head, as there was a red streak on it. He remarked it was probably a naevus, but he would examine it presently. When he did so, he was astonished to find on the scalp just above the occipital bone an abraded wound covered with lymph. It was $\frac{1}{4}$ in. long by $\frac{1}{4}$ in. broad. In a week it had dried, healed, and contracted to a line-like scar. In a month it was still the same, but a few hairs were coming through the cicatrix. The mother explained next day that a fortnight before confinement she (while in bed) reached over to the cot alongside, and about 18 in. lower than her bed, where her other child was lying, to comfort him, as he was peevish, and fell asleep, and on awaking her abdomen was resting on the iron side-rail of the bedstead, and was so cramped that she had to raise it with her hands before she could get back to bed.

Since writing this, Dr. Hamilton said, the baby's grandmother informed him on December 3rd that about three weeks before the birth the mother was turning a wringer, when the handle slipped and hit her on the abdomen. She did not feel ill after the blow, but this seemed to him to be a more probable explanation of the cause, as the wound was transverse and not vertical, as one would have expected if caused by the iron rail.

CASE II.—Mrs. W., confined on August 4th. Baby was born a few minutes after Dr. Hamilton's arrival. No previous digital examination. Almost in the same position as in the last case were three rounded abrasions covered with lymph, and of a red glassy appearance. The central one was as large as a big marble, and one on each side, separated by about half an inch, was as big as a pea. The wounds were healed in about ten days. The mother explained that exactly three weeks before labour she ran after her other child—a toddler of a couple of years—who had run out on to the stairs, fearing she would fall down them, and in doing so she caught her abdomen on a three-handled knob or key in door. She felt sick and faint for a few minutes, but experienced no symptoms afterwards. Dr. Hamilton saw this child on October 22nd, when he vaccinated her. There were three white rounded cicatrices on the head, without any appearance of hair, but no loss of substance otherwise.

These cases were, he thought, most unusual, and he brought them before the notice of the Division to elicit information as to whether any other member had had a similar experience, and also to know whether they agreed with him that the mother's statements could be taken as cause and effect. From a medical jurisprudence point the cases were very important. One could quite understand that a doctor, midwife, or nurse might get the credit of having caused the wounds with the finger-nail, but in neither of these cases was a digital examination made. He could see nothing in Speigelberg or other works in his possession on the subject. In *Quain's Dictionary* Dr. Ballantyne stated that it might be safely concluded the fetus did not often suffer from traumatism apart from the act of birth. Another observation worth recording was the absence of the healing process *in utero* and its rapidity after birth. A very interesting discussion took place on the paper.

Vote of Thanks.—A hearty vote of thanks was passed to Dr. Hamilton for having initiated the practice of discussing cases of interest which come to the notice of members in their daily work.

LAMBETH DIVISION.

A GENERAL MEETING of the Lambeth Division was held at Lambeth Infirmary, Brook Street, S.E., on Friday, January 15th, at 4 p.m. There were present Dr. ATKINSON, in the chair, and eighteen members and visitors.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Paper.—Dr. T. G. STEVENS read a paper upon some of the difficulties and dangers met with in connexion with uterine fibroids. He said that fibroids which were not causing symptoms required little or no treatment, but that when symptoms resulted the treatment now was very different to what it was even a few years ago. Much unnecessary suffering, ill-health, and even death from intercurrent maladies which would not have proved fatal

had the general health been good, were prevented by much earlier operation than formerly; some of the indications for operating soon he considered to be: repeated excessive uterine hæmorrhage; evidence of pressure upon ureters; retention of urine; evidence of any infective trouble in the fibroid; evidence of possible obstruction to a fetus by the fibroid; necrotic changes in the fibroid, or cystic or sarcomatous changes in it; evidence of internal bleeding from rupture of a vessel in the surface of the fibroid. The paper was discussed by Dr. CAPES, Dr. QUARRY, Dr. HICKLEY, and the HONORARY SECRETARY.

Votes of Thanks.—A hearty vote of thanks to Dr. Stevens for his paper was proposed by Dr. CAPES, seconded by Dr. STURGES JONES, and carried by acclamation. A vote of thanks to Dr. Quarry and to the Lambeth Board of Guardians for their kind arrangements for the meeting was carried unanimously, on the motion of Dr. HERBERT TAYLOR, seconded by Dr. SANGSTER.

Hospital Treatment of Accidents.—A report from the Medical Charities Committee on the question of hospital treatment of accidents in its relation to the Workmen's Compensation Act was received.

An Advertisement.—The following advertisement from the *South London Observer and Camberwell and Peckham Times* of Saturday, December 19th, 1908, was discussed: "Guy's Surgical Home for Ladies of Limited Means. Surgical, Medical, Maternity, or Slight Mental Cases. All Home Comforts. For Vacancies apply Matron, 243, Camberwell Road." It was reported that the institution had nothing whatever to do with Guy's Hospital; and that the institute was under the supervision of a medical man. The Honorary Secretary was instructed to write a letter to this gentleman, calling his attention to the fact that his use of the word "Guy's" in this way was misleading, and asking him if he would be so kind as to inform the Division what steps, if any, he would take to alter this.

QUEENSLAND BRANCH.

THE annual meeting of the Queensland Branch of the Association was held on Friday evening, December 4th, 1908, at the Technical College, Brisbane, Dr. J. LOCKHART GIBSON, President, in the chair.

Election of Officers.—The following members were elected for office during the year 1909: President, Dr. G. L'ESTRANGE; Vice-Presidents, Drs. HARDIE and J. LOCKHART GIBSON; Treasurer, Dr. A. MARKS; Curator, Dr. WILTON LOVE; Auditors, Drs. EDITH URA and ELEANOR BOURNE; Council, Drs. ROBERTSON, P. BANCROFT, TURNER, ESPIC DODS; Honorary Secretary, Dr. A. B. BROCKWAY.

SOUTH-EASTERN BRANCH:

BROMLEY DIVISION.

A MEETING of this Division was held at the Bell Hotel, Bromley, on Thursday, January 21st, Dr. A. TENNYSON SMITH, Chairman of the Division, in the chair.

Medical Inspection of School Children.—The report of the Medico-Political Committee "on certain points in connexion with the medical inspection," etc., was considered. After a full discussion the following resolutions were passed:

1. (a) The Division approves of the system of payment per head, that the minimum payment be 2s. 6d. (per head), and that an allowance should be made for travelling expenses.
2. The treatment of children found defective; and
3. The Division unanimously supports the motion handed in at the Annual Representative Meeting, 1908, by Dr. A. H. WILLIAMS (Watford and Harrow). This motion appears in Appendix II of Report, page 11.
4. No suggestions were made.

The late Dr. Seddon.—It was unanimously decided that a letter of sympathy be written by the Chairman and sent to the relatives of the late Dr. Seddon, Honorary Secretary of the Division.

Appointment of Honorary Secretary.—It was unanimously resolved that Dr. Tennyson Smith be appointed Honorary Secretary of the Division.

Appointment of Chairman.—It was unanimously resolved that Dr. Scott of Bromley be appointed Chairman of the Division on the resignation of Dr. Tennyson Smith from that post.

SOUTH-WESTERN BRANCH: PLYMOUTH DIVISION.

Medical Inspection of Schools.—A meeting of this Division was held on January 20th to consider the report of the Medico-Political Committee re certain points in connexion with the medical inspection of school children and the treatment of those found defective. After considerable discussion in a well attended meeting, it was unanimously resolved that as regards inspection—

Part time officers, to give half a school day per week at a salary of £50 per annum, should be appointed to do this work.

As regards treatment it was unanimously resolved—

(a) That the actual treatment of school children should not be undertaken by medical inspectors of schools. (b) That in all cases of disease or defect, the parents should be referred to their own medical attendant, who alone should decide what treatment should be given and where it is desirable such treatment should be given. (c) Cases having no medical attendant and being too poor to pay for advice should be referred to the Poor-law medical officer.

Further, the Division recorded its objection to the formation of school clinics, unless under the Poor Law.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH.

A MEETING of this Branch was held on December 17th, 1908, at the General Infirmary, Worcester, Dr. EDGAR MORRIS, President, in the chair. There were also present: Drs. Edgar Overay-Jones, Mobyen Read, N. O. Holbeche, Thomas Turner, J. B. Siddall, G. W. Crowe, Charles Pollard, Herbert Jones, J. N. F. Fergusson, Arthur Wood, Arthur Green, T. G. Elsworth, W. W. Horton, C. Thompson, Paul Chapman, Llewellyn B. Green, H. A. Watson, Nugent Smyth, J. C. Bowes, T. Bates, Lawrence W. Pole, Gilbert Chorsley, Wellesley Coombs. Visitors: W. H. Robinson, Kilburn K. Grieve, Fred J. Ayre, Lieutenant-Colonel C. H. Melville, and Dr. Mary Williams.

Apologies for Non-attendance.—Letters of apology for inability to attend were read from Messrs. C. F. Cuthbert, S. L. Haynes, T. P. Gostling, and C. H. East.

Confirmation of Minutes.—The minutes of the annual general meeting of June 18th, 1908, were read and confirmed.

Proposed Ethical Committee.—The PRESIDENT reported that the Branch Ethical Committee could not at present be constituted, in consequence of the remodelling of rules that were under consideration by the Central Ethical Committee.

The Health of the Soldier.—Lieutenant-Colonel MELVILLE, R.A.M.C., read a paper on Military Sanitation: the health of the soldier: how the civil medical profession can co-operate with the Royal Army Medical Corps in this direction. A discussion followed, in which the following took part: The PRESIDENT, and Messrs. SIDDALL, HERBERT JONES, A. L. GREEN, N. SMYTH, and G. CROWE. We give Dr. SIDDALL's remarks in full. He said: Although not now engaged in practice, it may not be out of place for me to make one or two remarks on this subject, as it is one in which I have been interested, and as it fell to my lot to be, in conjunction with the late Dr. William Willis, a brother of the late George Willis of Monmouth, what one may call one of the pioneers of medical education in Japan, where medical knowledge has made such vast strides in the last forty years. I have studied the results of the Russo-Japanese and other wars with considerable interest. I arrived in Japan in June, 1863 (having been appointed to succeed the late Dr. William Willis as Physician to Her (late) Britannic Majesty's Legation), soon after the commencement of the civil war which resulted in the retirement of the Taikun (or Tycoon) from power. Dr. Willis had at that time a number of wounded men under his care at Yokohama, but as the fighting receded north Dr. Willis was allowed by Sir Henry Parkes to go with the army, and I remained at what may be called the base. The numbers grew beyond the accommodation

at Yokohama, and in November, 1868, I established the first hospital in Japan, and which contained 500 beds. Sanitation at that time was unknown amongst the Japanese, and, to illustrate some of the difficulties I had to contend with, I may mention that I had given instructions for all deleterious matters to be burned; but, as I noticed that some holes had been dug and subsequently filled in, I suspected that the refuse had been buried, and so one day, when going round, I sent for a coolie and told him to dig in a certain place. At first nothing was found, and I was about to give up the search, but on digging a little more to the right I found a lot of poultices, bandages, etc., so I went off to the English Consulate and said I should see no more patients till everything had been dug up and burned, and, as I had supreme authority, this was done, and I had no further trouble. This was one of the first lessons in hygiene. Dr. Willis subsequently established a medical school at Kagosima (Satsuma's capital), and had for one of his pupils Baron Takaki, later a distinguished student at St. Thomas's Hospital, who became Director General of the Japanese navy. Colonel Melville has referred to the Crimean war. The French lost more men before they got to the Crimea than they had killed in the whole of the war, and the English losses were: Killed in action 2,755, died of wounds 1,847, and of disease 17,580. It is said of Sir George Brown that when asked what was to be done with the sick when about to cross the Black Sea, he said, "D—n the sick," showing that their condition was of no interest to him. In the cathedral there is a memorial tablet to the men of the Worcester Regiment who lost their lives in South Africa. It reads: Died 57, killed in action 8, died of wounds 2, showing the large mortality due to sickness over bullets. It has always appeared to me, but I speak with all reservation in the presence of Colonel Melville, that the combatant officers of the service have never given due consideration to the suggestions of the medical staff, and that the latter have not had sufficient authority, but as there is now an Advisory Council, of which Sir Frederick Treves is a member, probably in the future the regulations as to hygiene may be more efficacious. Sir Frederick Treves said of the Japanese that they expected to get 1 per cent. of sick, and got it; we expected 10 per cent., and got it. At Hiroshima the Japanese had a hospital of 15,000 beds. Of these 14,500 were for wounded and 500 for sick. With reference to Colonel Melville's remarks as to hygiene being taught in schools, I think an elementary course would be of benefit, and for the Territorials when in camp at places like Salisbury Plain some lectures like those for first aid to the injured might be of benefit, and also practical work in making latrines. These should be given at as early a date as possible, and when we see what results have been obtained by the Japanese there should be no difficulty in giving our men the instructions that would be of such benefit to themselves and the country.

Vote of Thanks.—Colonel MELVILLE having replied, the PRESIDENT moved, and Dr. SIDDALL seconded, a hearty vote of thanks to Colonel Melville for his most interesting and informing paper, which was carried by acclamation.

Phtisis in Children.—Dr. MARY WILLIAMS read a paper on phtisis in children. Dr. Williams, as an inspectress of school children under the Worcester County Council, brought forward elaborate statistics and the results of her own clinical observations in support of the view that the prevalence of phtisis among children of school age was greater than was generally recognized, and it formed the basis in later life for a recurrence in a very large percentage of those who died from phtisis between the ages of 15 and 35. The discussion of the paper was postponed to the next meeting, and the meeting resolved to request Dr. Mary Williams to allow the paper to be published in the BRITISH MEDICAL JOURNAL in view of its great practical importance, and many novel speculations and suggestions for future fruitful inquiry raised in the paper. Dr. Mary Williams was cordially thanked for her interesting paper.

Demonstration.—Dr. PAUL CHAPMAN exhibited an extreme case of multiple lipomata, and gave a clinical demonstration in the administration of anaesthetics by Dubois's apparatus, simplified in use by a footpiece which he had designed. In consequence of the lateness of the hour, Mr. Pollard's notes on two cases of extroversion of the bladder, one operated on and the other unoperated, was reserved for the next meeting of the Branch.

ES To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

BIRMINGHAM BRANCH: COVENTRY DIVISION.—A meeting of this Division will be held at the Coventry and Warwickshire Hospital, on Tuesday, February 2nd, at 8.30 p.m. Agenda: (1) Minutes of last meeting. (2) Specimen: fibula removed from leg, to be shown by Dr. Harman Brown. (3) The matters of "payment for school certificates," also "fund for Mrs. Bird, and testimonial to late Provident Dispensary Medical Officers," to be brought forward by the Secretary. (4) Discussion upon "Relationship between Medical Men and Nurses," introduced by Dr. Milner Moore. Also specimens: three ovarian tumours to be shown by Mr. W. E. Bennett.—**JOHN ORTON**, Honorary Secretary.

LANCASHIRE AND CHESHIRE BRANCH: ALTRINCHAM DIVISION.—A general meeting of the Division will be held at 5 p.m. on Wednesday, February 17th, at the Brooklands Hotel. The meeting will be a special meeting under Rule 14, for the purpose of amending Rule 8 (election of Representative), and of considering the adoption of new rules (namely, "Bradford" Rule, and Rule Z), copies of which have been sent by post to each member. In the ordinary meeting Dr. Rhodes will read a paper, and the usual general business will be taken.—**T. W. H. GARSTANG**, Honorary Secretary.

LANCASHIRE AND CHESHIRE BRANCH.—Meetings of the following Branch Committees will be held on the dates mentioned, namely: Organization and Finance Committee, at the Royal Infirmary, Manchester, on Wednesday, February 3rd, at 4.30 p.m.; Ethical Committee, at the Royal Infirmary, Manchester, on Friday, February 5th, at 4.30 p.m. The Branch Council will meet at the Medical Institution, Liverpool, on Wednesday, February 10th, at 4.30 p.m.—**F. CHARLES LARKIN**, Honorary Secretary.

LEINSTER BRANCH.—The annual general meeting will be held on Saturday, February 13th, in the Royal College of Physicians, Rildare Street, Dublin, at 4.30 p.m. The annual dinner will be held in the College Hall at 7.30 p.m. of the same day.—**ARTHUR H. WHITE**, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER DIVISION.—A meeting of this Division will be held at the Criterion Restaurant, Piccadilly, on Thursday, February 4th. Dinner, 7.30 p.m. Business, 9 p.m. Paper by A. W. Mayo Robson, F.R.C.S.: The Importance of Early Diagnosis for Successful Surgical Treatment.—**J. HOWELL EVANS**, Assistant Honorary Secretary.

SOUTH MIDLAND BRANCH: BEDFORD AND HERTS DIVISION.—A meeting of the Division will be held at Bedford County Hospital, Bedford, at 3 p.m., on Thursday, February 11th. Dr. S. P. Dixon in the chair. Agenda: (1) Minutes. (2) Revision of Divisional Rules. (3) Consideration of the Report of Medicopolitical Committee on the Medical Inspection of School Children. Members wishing to read papers or show cases are requested to communicate with the Secretary as soon as possible.—**E. H. COBB**, Honorary Secretary, Belmont, Stevenage.

ULSTER BRANCH.—The winter meeting of this Branch will be held in Belfast on Wednesday, February 3rd.—**OCELL SHAW, M.D.**, Honorary Secretary, Belfast.

CENTRAL MIDWIVES BOARD.

A MEETING of the Central Midwives Board was held at Caxton House, Westminster, on January 21st, with Dr. F. H. CHAMPNEYS in the chair.

Resignation of Miss J. Wilson.

The CHAIRMAN announced that he had received from Miss J. Wilson a letter stating that she had resigned her place on the Board as a protest against the absence of any certified midwife on the Departmental Committee appointed to consider the working of the Midwives Act. The Chairman then proposed a resolution stating that the Board heard with great regret of the resignation of Miss Wilson, and expressing their appreciation of her work, concluding with the words, "Her loss is irreparable."

This resolution was agreed to unanimously.

Mr. E. PARKER YOUNG moved that the following words be added to the Chairman's resolution: That the Board "profoundly sympathizes with her for the reasons that induced her to resign."

Mr. J. WARD COUSINS, in seconding, expressed his regret that Miss Wilson had not been placed on the Departmental Committee.

Sir GEORGE FORDHAM said it was undesirable for the Board to set itself up as a critic of the Privy Council by passing such a resolution. The inquiry was a domestic matter of the particular Government departments concerned.

Sir WILLIAM J. SINCLAIR said that for the Board to interfere with the Privy Council would be an ill-advised step and a piece of impertinence.

On being put to the vote, 4 voted for and 4 against the motion, which was lost by the Chairman's vote.

The Departmental Committee on the Midwives Act.

Mr. E. PARKER YOUNG moved:

That the Lord President of the Council be respectfully requested to consider the advisability of adding to the Departmental Committee representatives of the interests of general medical practitioners and midwives, as the Board considers that such additions would greatly enhance the value of the report eventually come to by that Committee.

He said that since the Departmental Committee had been appointed already one addition had been made—that of a medical officer of health. With something like 40,000 medical practitioners it would not be difficult to choose suitable men to serve on the Committee. Cases would come before it for the consideration of which it was most important that they should be members representing not only the general practitioner but also the midwives; this would increase public confidence in the report of the Committee.

Mr. ATKINSON seconded.

Sir GEORGE FORDHAM said that he questioned the propriety of the Board expressing something of a censure on the Privy Council by the resolution. It would put the Chairman of the Central Midwives Board, who was a member of the Committee, in an embarrassing position.

Mr. WARD COUSINS, in supporting the resolution, said every influence should be brought to bear to heal the differences between medical practitioners and midwives in the country. It was placing too much responsibility on the Chairman of the Board to expect him to represent the whole medical profession on one of the most dangerous Departmental Committees ever appointed. If one or two practitioners were placed on the Committee it would be an assistance to the Chairman in questions which a consultant could not know about. If the Committee succeeded in its work it would heal the differences between medical men and midwives which were obstructing the working of the Midwives Act.

Miss R. PAGET thanked Mr. Parker Young for including in his resolution the suggestion that a representative of the midwives should be added to the Committee.

Sir WILLIAM J. SINCLAIR deprecated the tendency of the Board to interfere in the squabbles between doctors and midwives. In the North of England there was a clear improvement in the relations between midwives and doctors. He did not consider that an ordinary practising midwife was fitted intellectually to take an efficient part as a member in the proceedings of such an important Departmental Committee. The use of such women would be in giving their practical experience by means of evidence. The Board had no right to dictate to the Lord President of the Privy Council, and he (Sir W. J. Sinclair) strongly protested against the action proposed to be taken by the Board in matters which did not concern it.

Mr. PARKER YOUNG contended, on the other hand, that the Board was constituted to administer the Midwives Act; and if that Act was going to be altered and the Board did nothing, their constituents would say that the Board knew there were certain things in the Act rendering it unworkable; for instance, they heard of midwives sending to eight or nine doctors before they could get one to attend, and yet the Board did nothing towards remedying such a state of things. It was admitted that something should be done to secure a clause in the Act ensuring the payment of doctors called in by midwives. Sir William Sinclair said matters were not so bad as had been represented by Mr. Ward Cousins, but matters were getting worse. Sir William Sinclair did not belong to the class of general practitioners who knew where the shoe pinched, and so did the midwives; and it was only fair and just

that in framing any amending Act the question should be gone into thoroughly. The resolution was not an attempt to dictate to the Lord President, but a respectful request for a consideration of the advisability of adding to the Departmental Committee.

On being put to the vote, the resolution was carried.

Alleged Drunkenness.

A letter was considered from H.R.H. Princess Christian as to charges of drunkenness reported against two of the nurses in the Windsor Maternity Home. The Board decided that the letter be referred to a subcommittee to investigate and report on the whole method by which the midwives of the Windsor Maternity Home are engaged.

Advertising.

Letters were considered from Mr. G. Stainton, acting as the solicitor of Eliza Annie Collins, promising to suppress the circular dealt with by the Board's resolution of December 17th, 1908, and undertaking that his client will not issue any advertisement suggesting that she is qualified to give medical treatment. The Board decided that no further action be taken in the matter.

Training of Midwives.

Letters were considered from the Honorary Secretary of the Swansea District Nursing Association complaining of the action of the Board in hampering the association in its efforts to train midwives. The Board decided that it be left to the Secretary to send an appropriate reply.

Vaginal Examination.

A letter was considered from Dr. A. Stookes, of Liverpool, on behalf of the medical board of the Liverpool Maternity Hospital, as to the system of teaching adopted at that institution with regard to the number of vaginal examinations to be made. The Board decided that Dr. Stookes be informed that the system of teaching, with regard to vaginal examinations, adopted at the Liverpool Maternity Hospital appeared to comply with the rules of the Board.

A letter was considered from the Secretary of St. Mary's Hospitals, Manchester, inquiring whether the Board's resolution as to the necessity of having twenty distinct cases for each candidate was retrospective so far as regards repeated vaginal examinations. The Board decided to reply that the resolution was not meant to be retrospective.

Advising Medical Help.

A letter was read from Dr. G. C. Taylor, County Medical Officer for Berks, as to the necessity of advising medical help in a case of premature birth. The Board decided that Dr. Taylor be informed that under the circumstances mentioned it is unnecessary to advise medical help unless there be some complication present.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

INSPECTOR-GENERAL G. J. IVINE has been placed on the retired list, January 17th. His commissions were thus dated: Surgeon, March 7th, 1871; Staff Surgeon, March 7th, 1883; Fleet Surgeon, June 14th, 1891; Deputy Inspector-General, January 1st, 1900; and Inspector-General, February 7th, 1905.

Surgeon W. J. SITTE has been allowed to withdraw from the service with a gratuity, January 21st. He was appointed Surgeon, May 13th, 1896.

The following appointments have been made at the Admiralty: Fleet Surgeon W. J. BEARBLOCK to the *President*, additional, for three months' course at West London Hospital, February 1st; Staff Surgeons J. H. FERGUSON and A. G. EASTMENT to the *Victory*, additional, for disposal, January 22nd; Staff Surgeon H. HOSKINSON, M.B., to the *President*, additional, for three months' course at West London Hospital, January 25th.

ARMY MEDICAL SERVICE.

COLONEL H. R. WHITEHEAD to be Surgeon-General, vice W. S. Pratt, C.B., retired, January 21st. The following are the dates of Surgeon-General Whitehead's previous commissions: Surgeon, July 20th, 1882; Surgeon-Major, July 24th, 1894; Surgeon-Lieutenant-Colonel, May 23th, 1898; and Colonel, January 26th, 1905. He was with the Tirah Expedition in 1898, being present at the action of Dargai, at the capture of the Samapasha and Arghaugh Passes, and in the operations against the Khaki Kheh (Chankunias) and in the Bara Valley (mentioned in dispatches, promoted to be Surgeon-Lieutenant-Colonel, and medal with two clasps). In 1908

he was present in operations against the Mohmands on the North-West Frontier of India, and was again mentioned in dispatches.

Surgeon-General V. S. PRATT, C.B., M.B., is placed on the retired list, January 21st. He was appointed Surgeon, March 31st, 1874; Surgeon-Major, June 15th, 1885; granted the rank of Lieutenant-Colonel, September 15th, 1895; made Lieutenant-Colonel, and Colonel, July 9th, 1902; and Surgeon-General, December 29th, 1905. He served as Assistant Surgeon with the Armée du Rhin under Marshal Bazaine in the Franco-German war of 1870-1, and was present at the actions of Gravelotte and Mars-la-Tour, and driven into Metz with the French army, and remained during the siege and until the surrender of the fortress from starvation. He was afterwards with the Nile Expedition in 1884-5 on the staff of Lord Wolseley, was mentioned in dispatches, promoted to Surgeon-Major, and received a medal and clasp and the Khedive's bronze star. He has been Principal Medical Officer at Gibraltar; Administrative Medical Officer, India; and Principal Medical Officer, Southern Command, Suez Canal, Egypt. He is serving in India, and is appointed Principal Medical Officer, 4th Lucknow Division, vice Surgeon-General W. B. Slaughter, retired.

Colonel D. O'SULLIVAN, also serving in India, is appointed Principal Medical Officer, 4th (Quetta) Division, vice Surgeon-General Ellis, transferred.

Lieutenant-Colonel S. C. B. ROBINSON, from the Royal Army Medical Corps, to be Colonel, vice H. R. Whitehead, January 21st. He was appointed Surgeon, February 5th, 1881; Surgeon-Major, February 5th, 1893; and Lieutenant-Colonel, February 5th, 1901. He served in the South African war in 1898-1902, being present in the advance on Kimberley, in the actions at Belmont, Emslin, Modder River, and Magersfontein, and in operations in the Orange Free State, including actions at Paardeberg, Poplar Grove, and Dreifontein, and in operations in the Transvaal, including actions near Johannesburg, Pretoria, and Diamond Hill, and subsequently at Belfast; he has received the Queen's medal with seven clasps and the King's medal (the official *Army List* says with three clasps, but this is apparently an error for two clasps).

Colonel W. J. R. RAINFORD, C.I.E., is placed on retired pay, January 26th. His commissions are thus dated: Surgeon, February 4th, 1877; Surgeon-Major, February 4th, 1889; Surgeon-Lieutenant-Colonel, February 4th, 1897; and Colonel, December 14th, 1903. His war record is as follows: Afghan war, 1879-80, with the Khyber Field Force (medal); Egyptian war, 1882 (medal and Khedive's bronze star); Sudan Frontier Field Force, 1885-6; China war, 1890 (mentioned in dispatches, appointed C.I.E., and received medal with clasp).

Lieutenant-Colonel R. W. FORD, D.S.O., from the Royal Army Medical Corps, to be Colonel, vice W. J. R. Rainford, C.I.E., January 26th. Colonel Ford was appointed Surgeon, February 5th, 1881; Surgeon-Major, February 5th, 1893; and Lieutenant-Colonel, February 5th, 1901. He served in the Egyptian war in 1882, receiving a medal and the Khedive's bronze star. He was in the South African war in 1898-1902, in charge of a stationary hospital at Pretoria, and was at the relief of Kimberley, in operations in the Orange Free State, including actions at Paardeberg, Poplar Grove, Dreifontein, Val River, and Sand River, and in subsequent operations in the Transvaal. He was mentioned in dispatches, appointed D.S.O., and granted the Queen's medal with four clasps.

Lieutenant-Colonel E. ECKERSLEY, M.B., R.A.M.C., to be Deputy Assistant Director-General at Head Quarters, Indian Medical Corps, A. E. Title, January 20th. Lieutenant-Colonel Eckersley joined the Army Medical Service as Surgeon, July 28th, 1885; was made Major, July 28th, 1898, and Lieutenant-Colonel, July 28th, 1906. He was with the Ashanti expedition, 1895-6, receiving a star; he was also in the South African war in 1898-1902, being present at the relief of Ladysmith, including the actions at Colenso, Spion Kop, Vaal Kraz, on the Tugela Heights, and at Pieters Hill; he was also in operations in Natal, in the Transvaal, and on the Zululand Frontier. He has received the Queen's medal with five clasps and the King's medal with two clasps.

ROYAL ARMY MEDICAL CORPS.

LIEUTENANT S. G. WALKER, from the Seconded List, to be Lieutenant, January 8th. He was appointed on probation, February 4th, 1908.

Captain R. J. CUMMINS, M.B., from the Seconded List, to be Captain, January 7th. He was seconded for service with the Egyptian Army, January 7th, 1899.

Captain G. S. NICKERSON, M.B., retires, receiving a gratuity, January 23rd. He was appointed Lieutenant, July 27th, 1898, and promoted to be Captain three years thereafter. He was with the Nile expedition in 1899, being present in the operations resulting in the final defeat of the Khadda; he was mentioned in dispatches, and received a medal with two clasps.

Lieutenant H. H. LEESON, from the Seconded List, to be Lieutenant, January 16th. He was appointed on probation, August 1st, 1908.

Lieutenant-Colonel R. W. FORD, D.S.O., has been appointed Administrative Medical Officer at Tidworth, vice Colonel M. W. Kerin, who has proceeded to India.

Lieutenant-Colonel B. M. SKINNER, M.V.O., who is serving in India, is appointed to officiate as Principal Medical Officer, Abbottabad and Sikhotei Brigades.

Colonel O. E. P. LLOYD, V.C., also serving in India, is appointed Principal Medical Officer, 7th (Meerut) Division, and not to the 1st (Peshawar) Division, as previously reported, vice Colonel H. K. McKay, C.B., C.I.E., Indian Medical Service, transferred.

INDIAN MEDICAL SERVICE.

COLONEL H. ST. C. CARRUTHERS, Madras, has been appointed Principal Medical Officer, Kohat Brigade, and not to Abbottabad and Sikhotei Brigades temporarily, as previously reported, vice Colonel C. H. Beaton, transferred.

TERRITORIAL FORCE.

ROYAL FIELD ARTILLERY.

SURGEON-LIEUTENANT-COLONEL T. MCC. FOLEY, from the 1st East Riding of Yorkshire Royal Garrison Artillery (Volunteers), to be Surgeon-Lieutenant-Colonel, 2nd Northumbrian Brigade, with precedence as in the Volunteer Force, April 1st, 1908.

Surgeon-Major J. SOUTTER and Surgeon-Captain H. ROBINSON, M.B., from the 2nd East Riding of Yorkshire Royal Garrison Artillery (Volunteers), are appointed to the 2nd Northumbrian Brigade, with precedence as in the Volunteer Force, April 1st, 1908 (Surgeon-Captain Robinson to be supernumerary).

INFANTRY.

Surgeon-Lieutenant W. G. RICHARDSON, M.B., 6th Battalion the Northumberland Fusiliers, resigns his commission, December 15th, 1908.

ROYAL ARMY MEDICAL CORPS.

For Attachment to Units other than Medical Units.—Surgeon-Lieutenant J. R. ARMSTRONG, M.D., from the 3rd Volunteer Battalion the Welsh Regiment, to be Lieutenant, with precedence as in the Volunteer Force, April 1st, 1908. Lieutenant G. S. WARD to be Captain, November 30th, 1908. J. A. WYLLIE to be Lieutenant, December 1st, 1908. Lieutenant R. BERNER, M.B., from the North Midland Mounted Brigade Field Ambulance, to be Lieutenant, December 31st, 1908. Surgeon-Lieutenant L. C. V. HARDWICK, from the 5th Battalion the Prince of Wales's North Staffordshire Regiment, to be Lieutenant, January 1st. The promotion of Captain (Honorary Captain in the Army) GEORGE G. OARLEY to the rank of Major carries seniority above Major William K. Clayton, and not as stated in the *London Gazette* of December 15th, 1908.

Third East Anglian Field Ambulance.—J. R. POOLER, M.B., to be Lieutenant, December 24th, 1908.

Third Welsh Field Ambulance.—Lieutenant D. B. CHILLES-EVANS to be Captain, December 12th, 1908.

Second Western General Hospital.—To be an officer whose services will be available on mobilization: J. J. COX, M.D., F.R.C.S. Edin., to be Major, January 9th, 1909.

Sanitary Services.—To be an officer whose services will be available on mobilization: Major J. NIVEN, M.B., from the Second Western General Hospital, with precedence next below Major A. A. Masson, December 28th, 1908.

North Midland Mounted Brigade Field Ambulance.—WILLIAM M. HURVETSON, M.B., to be Lieutenant, December 9th, 1908; WILLIAM C. GILDAY to be Lieutenant, December 15th, 1908.

Lieutenant H. C. BARR resigns his commission, November 19th, 1908.

ROYAL ENGINEERS.

Surgeon-Lieutenant H. G. F. DAWSON, from the 1st Cheshire Royal Engineers (Volunteers), to be Surgeon-Lieutenant, Welsh Divisional Engineers, with precedence as in the Volunteer Force, April 1st, 1908.

IMPERIAL YEOMANRY.

SURGEON-MAJOR E. C. THOMPSON, M.B., North of Ireland Regiment, resigns his commission, July 7th, 1908.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 8,209 births and 4,964 deaths were registered during the week ending January 23rd. The annual rate of mortality in these towns, which had been 18.2, 17.5, and 16.6 per 1,000 in the three preceding weeks, further fell to 15.7 per 1,000 last week. The rates in the several towns ranged from 6.8 in Leyton, 8.1 in Willesden, 8.2 in Hornsey, 8.4 in Walthamstow, 9.3 in Tottenham, and 9.8 in East Ham and in Boodle, to 20.4 in Nottingham, 20.5 in Maford, 20.6 in Manchester, 20.9 in Rochdale, 21.5 in Stockton-on-Tees, 22.4 in Warrington, and 23.6 in Stockport. In London the rate of mortality was 15.5 per 1,000, while it averaged 15.8 per 1,000 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.4 per 1,000 in the seventy-six towns: in London this death-rate was equal to 1.5 per 1,000, while among the seventy-five other large towns the death-rate from these diseases ranged upwards to 2.6 in Nottingham, 2.8 in Huddersfield, 2.9 in Stockton-on-Tees, 3.0 in Manchester, 3.2 in King's Norton, 3.5 in West Hartlepool and in Sunderland, and 7.9 in Warrington. Measles caused a death-rate of 1.1 in West Ham and in Hull, 1.2 in Aston Manor and in Sheffield, 1.5 in Leicester, in Stockport, and in Manchester, 1.7 in Huddersfield, 1.8 in Birmingham, 2.5 in Sunderland, 3.3 in West Hartlepool, and 4.3 in Warrington; scarlet fever of 1.3 in Merthyr Tydfil; diphtheria of 1.2 in Rochdale, 1.3 in King's Norton, 1.6 in Rotherham, and 2.2 in Warrington; whooping-cough of 1.3 in Coventry, 1.4 in Bourne-mouth, 1.9 in Tynemouth, and 2.0 in Stockton-on-Tees; "fever" of 1.4 in Warrington; and diarrhoea of 1.5 in Smethwick. No fatal case of small-pox was registered in any of the seventy-six towns during the week. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 3,57, 3,57, and 3,261 at the end of the three preceding weeks, had further fallen to 3,211 at the end of last week; 379 new cases were admitted during the week, against 373, 325, and 358 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

DURING the week ending Saturday last, January 23rd, 1,013 births and 671 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 19.5 and 18.1 per 1,000 in the two preceding weeks, rose again to 18.3 per 1,000 last week, and was 3.1 per 1,000 above the mean rate during the same period in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 11.7 in Perth and 14.0 in Leith to 20.7 in Aberdeen and 21.9 in Dundee. The death-rate from the principal infectious diseases averaged 1.6 per 1,000, the highest rates being recorded in Glasgow and Aberdeen. The 309 deaths registered in Glasgow included 7 which were referred to diphtheria, 23 to whooping-cough, and 2 to diarrhoea. Three fatal cases of whooping-cough and 4 of diarrhoea were recorded in Edinburgh; 2 of whooping-cough in Dundee; 2 of diphtheria and 6 of whooping-cough in Aberdeen; and 2 of diphtheria in Paisley.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, January 23rd, 597 births and 473 deaths were registered in the twenty-two principal urban districts of Ireland, as against 605 births and 468 deaths in the preceding period. The annual death-rate in these districts, which had been 24.7, 20.4, and 21.4 per 1,000 in the three preceding weeks, rose to 21.6 per 1,000 in the week under notice, this figure being 5.9 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 25.3 and 6.6 in Queenstown to 37.0 in Tralee, while Cork stood at 29.5, Londonderry at 15.7, Limerick at 17.8, and Waterford at 21.4. The zymotic death-rate in the twenty-two districts averaged 1.0 per 1,000, as against 1.4 per 1,000 in the preceding period.

Hospitals and Asylums.

THE BIRMINGHAM GENERAL HOSPITAL.

DURING the year ending December 31st, 1908, the number of in-patients treated has been 5,229, and the number of out-patients 66,033. Of these, 578 in-patients and 21,743 out-patients presented tickets. First-aid was rendered to 2,294 out-patients, who were then referred elsewhere, under the scheme which came into force on March 23rd, 1908. The number of in-patients showed a decrease of 340 on the number admitted in the previous year, and the number of out-patients showed an increase of 3,931. At present there are 116 cases awaiting admission, all of them cases for operation, in spite of the fact that there were 3,779 surgical operations performed during the year. The total income for the year was £24,083, and the expenditure £26,510. This included £1,065 for alterations to the operating theatres. There was, therefore, a deficit of £2,427, and this, added to a deficit of £503 on the Jaffray Branch Hospital, and a deficit of £7,698 from the previous year, made the total amount overdrawn at the bank stand at £10,628. The annual subscriptions were £190 less than in the previous year, and the amount received from the Hospital Sunday Fund was diminished by £146. In 1907 the income was £21,953, and the expenditure £24,556.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column, advertisements must be received not later than the first post on Wednesday morning.

VACANCIES.

BIRKENHEAD BOROUGH HOSPITAL.—Junior Resident House-Surgeon (Male). Salary, £80.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

The British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the **BRITISH MEDICAL JOURNAL** is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association, and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the **BRITISH MEDICAL JOURNAL** for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

LANCASHIRE AND CHESHIRE BRANCH: MANCHESTER (WEST) DIVISION.

A GENERAL meeting of the Division was held at the Technical Institute, Stretford Road, on Tuesday, January 19th. Dr. F. H. Worswick was, in the absence of the Chairman and Vice-Chairman, voted into the chair.

Apologies for Non-attendance.—A letter from Dr. A. Brown Ritchie, expressing regret at his inability to attend the meeting, was read.

Confirmation of Minutes.—The minutes of the last meeting were read and adopted.

Appointment of Representative on Branch Council.—The HONORARY SECRETARY reported that Dr. F. H. Worswick had been appointed by the Executive Committee as one of the Representatives on the Branch Council, vice Dr. J. Brassey Brierley, who had resigned.

A Local Trade Provident Society.—A letter from the Sheffield Division, asking for support in the attitude taken by that Division towards a local trade provident society, was read. The meeting instructed the Honorary Secretary to acknowledge the communication, and state that the Division is in agreement with the position taken.

Friendly Societies and the Medical Profession.—The Honorary Secretary was requested to thank the Medical Secretary for his letter concerning the conference arranged by the Charity Organization Society to discuss a paper by Dr. Pearse, of Trowbridge, on Friendly Societies and the Medical Profession.

The Action of Branches and the Charter.—The report from the Organization Committee, embodying counsel's opinion upon the legality of the action of Branches and Divisions, in calling meetings and spending money for the purpose of opposing the application for the Royal Charter, was read and discussed. The following resolution (proposed by Dr. PROWSE, and seconded by Dr. SCANLON) was unanimously agreed to:

That this meeting, in view of the facts that (a) much dissatisfaction exists throughout the Association in regard to the clauses of the Charter dealing with the Referendum; and that (b) no action can at present legally be taken by any Branch or Division, to alter such clauses—is of opinion that a conference of leading members of the Association

should be convened at an early date to consider the possibility of arriving at some agreement on the questions involved, and of formulating the best method of giving force to such agreement as soon as practicable after the granting of the Charter.

Notification of Births.—A letter from the Medical Guild, pointing out that in connexion with the Early Notification of Births Act the authorities can claim no legal right of entry for the nurses into patients' houses, and suggesting that medical men attending confinements should inform their patients of this fact, was ordered to be laid on the table.

Joint Committee of Manchester and Salford Divisions.—In answer to a request from the Joint Committee of the Manchester and Salford Divisions, it was resolved that the honorary secretaries shall send reports to that committee of the Division's opinions and decisions in regard to the medical inspection and treatment of school children and other matters of interest dealt with at the meetings of the Division.

Workmen's Compensation Act.—The following resolution, forwarded in a communication from the Manchester and Salford Joint Committee, was unanimously adopted by the meeting:

That in all compensation cases the medical man attending ought to receive notice of the intended visit of a medical referee sent by insurance and other companies.

The communication from the Hospitals Committee in regard to the giving of certificates from hospitals was then considered, and it was resolved that Dr. PROWSE be requested to reply to the questions asked in connexion with the Hulme Dispensary, which is the only institution concerned in the Division.

Representatives at Representative Meeting.—The consideration of the circular from the Organization Committee in respect to the earlier election of the Representative to the Representative Meeting was referred to a future meeting.

Consultations and General Practitioners.—The meeting then appointed six members as representatives of the Division to serve on a subcommittee appointed by the Joint Committee of the Manchester and Salford Divisions, to consider the "ethical relations between consultants and general practitioners." The following gentlemen were elected: Sir W. J. Sinclair, Dr. E. Holgate Owen, Dr. A. M. Edge, Dr. F. H. Worswick, Dr. Floyd (Chairman of Division), and Dr. Farrow.

Medical Inspection and Treatment of School Children.—The report of the Medico-Political Committee re certain points in connexion with the medical inspection and treatment of school children was carefully considered, and the

Executive Committee was instructed to draw up a detailed report of the decisions arrived at by the meeting.

Report on Annual Representative Meeting.—The REPRESENTATIVE of the Division (Dr. PROWSE) gave an account of the Annual Representative Meeting held at Sheffield, and a short summary of some of the more important decisions which had been come to by that meeting.

PRESTON DIVISION.

A MEETING of this Division was held on Wednesday, January 27th, Dr. R. C. BROWN, President, in the chair.

Medical Inspection of School Children.—The Medico-Political Report was read and considered. After considerable discussion it was unanimously resolved that the Division:

1. Approves of payment per head for part-time officers with a minimum fee of 2s. 6d., and that extra work—for example, reports, etc.—be paid for.
2. Treatment. The Division unanimously agreed with the propositions of Dr. A. H. WILLIAMS, of Watford and Harrow.

British Medical Benevolent Fund.—Dr. TALBOT drew the attention of members to the British Medical Benevolent Fund and asked for more support to this charity.

METROPOLITAN COUNTIES BRANCH:

HAMPSTEAD DIVISION.

A MEETING of this Division was held on Tuesday, January 26th, at 5 p.m., at St. Peter's Hall, Belsize Square, N.W., Dr. OPPENHEIMER in the chair.

Annual Report to the Branch.—The HONORARY SECRETARY read the annual report to the Branch for 1908. The total membership had increased from 192 on December 31st, 1907, to 199 on December 31st, 1908. There had been eleven meetings of the Division, with an average attendance of 18. The chief question of local interest was the Hampstead Hospital dispute. The out-patient department in Hampstead had been nominally abolished.

Financial Report.—The total expenditure for 1908 was £35 17s. 6d., of which £28 3s. 1½d. was for ordinary expenditure and £7 14s. 5d. for extraordinary expenditure in connexion with the hospital dispute. There was on December 31st, 1908, a total deficit of £6 18s. 8½d., of which £3 18s. 5d. (extraordinary expenditure) had since been paid by the Branch, leaving £3 0s. 3½d. deficit on the ordinary expenditure account. This deficit was due in part to heavy expenditure in the hire of rooms and to other smaller items. The report was approved.

Medical Inspection of School Children.—The report of the Medico-Political Committee of the Association on the medical inspection of school children and the treatment of those found defective was considered. In answer to Question 1 (a) on page 11, the committee recommended the following resolution:

1. That this Division does not approve of the system of payment per head.

Dr. P. C. EVANS said that in Willesden Green payment per head had been agreed upon by the local practitioners. After some discussion the committee's recommendation was put to the vote and carried *nem. con.* With regard to the treatment of school children found defective, the committee brought forward the following resolution:

2. That destitute school children should be referred to a medical department organized by the State for the treatment of the destitute poor.

Mr. H. W. ARMIT moved an amendment, seconded by Dr. CLAUDE TAYLOR:

That this Division supports the institution of school clinics.

Mr. ARMIT said that the resolution recommended by the committee came very nearly to the same thing as supporting school clinics. He did not think that clubs and private practitioners could treat the children adequately. The London County Council had determined to have school clinics. They need not pauperize. Parents would be required to pay, and the medical officers would be paid. The profession as a whole would get definite payment. General practitioners should sink their private interests for the benefit of the race. He strongly approved of the institution of school clinics. Dr. CLAUDE TAYLOR agreed with Mr. ARMIT. He thought that the profession need not fear financial loss, but would

be directly and indirectly benefited. The school clinic would so educate the children that in after-life they would pay better attention to their health and be more likely to take medical advice if they became out of health. Mr. CUNNINGHAM objected to school clinics as having a Socialist tendency. He approved of medical inspection being organized by the State, but treatment should not be at the expense of the State save in the case of destitute children. In Hampstead nine-tenths of these school children belonged to clubs, friendly societies, etc., and their parents could afford to pay and did pay something for their treatment. Miss DOBBIE, in supporting the amendment, said that treatment in school clinics need not necessarily be free. She gave an example of the neglect of treatment which might follow the reference of cases to general practitioners. In this case a general practitioner had refused to sanction a necessary operation advised by a specialist, with the result that the child had suffered for six years longer from ill-health due to his neglect. The CHAIRMAN pointed out that even if school clinics were instituted, nothing could prevent the parents taking a child to a general practitioner, who might refuse to sanction an operation advised by the medical officer of the school clinic. Dr. MACKVY thought that it would be much better if the London County Council would help existing institutions instead of founding new ones. The provident dispensaries, if properly equipped, could do this work perfectly well. General practitioners nowadays were quite competent to remove adenoids, treat running ears, and do refractions. Mr. PARSONS, in supporting the committee's resolution, said the whole question was a political one. If children were to have medical treatment provided free by the State, why not supply them with boots free, and so on? It was the duty of the parents to provide these things for their children. The general practitioner was in danger of passing out of existence if school clinics were established. Mr. JESSOP said that the opinion of a general practitioner as to a throat case, for example, might be as good as, or better than, the opinion of a young medical officer to a school clinic. The school clinic would become nothing but a glorified huge out-patient department. Mr. ARMIT's amendment having been put to the vote and lost, the committee's resolution was agreed to. A third resolution was also carried as tending to safeguard the interests of the private practitioner:

3. That this Division approves of the form given on page 6, paragraph 10 of the report.

(That is, paragraph 7 (d) Board of Education's Memo. 596.) No other suggestions were made.

KENSINGTON DIVISION.

A MEETING of this Division was held at the Kensington Town Hall on January 21st, at 5 p.m., Dr. RICE OXLEY, the Chairman of the Division, in the chair.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Paper.—Mr. LEONARD A. BIDWELL, Surgeon to the West London Hospital, read a paper on the immediate and ultimate results of the operation of gastro-enterostomy for gastric and duodenal ulcer. (This paper will be reported in the JOURNAL.) Dr. RICE OXLEY thanked Mr. Bidwell for his interesting and instructive address, and referred to several points. The discussion was continued by Dr. LEWIS SMITH, who was present on the invitation of the Chairman, and by Dr. A. D'E. VALANCEY, Dr. CRAWFORD THOMSON, Dr. C. H. BENNETT, the HONORARY SECRETARY, and others. Mr. BIDWELL replied to the matters raised by the speakers.

Vote of Thanks.—Dr. BUTTAR proposed a hearty vote of thanks to Mr. Bidwell for his address. This was seconded by Dr. CRICHTON, and carried with acclamation.

NORTH OF ENGLAND BRANCH:

NORTH NORTHUMBERLAND DIVISION.

A MEETING was held at the Infirmary, Berwick-on-Tweed, on January 28th; Dr. MACKAY occupied the chair. There were also present Drs. Macaskie, Dey, Wilson, Coldstream, Robson, Paxton, Badcock, and Burman.

Apologies for Non-attendance.—Apologies for non-attendance were received from Drs. Main and Purves.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Midwives and the County Council.—The SECRETARY reported what had been done in connexion with the proposed introduction of midwives by the County Council, and read correspondence. The meeting thanked the Secretary for the work he had undertaken in relation to this question.

Appointment of Medical Inspector of School Children.—The CHAIRMAN reported that the post of medical inspector of school children had been accepted by a member of the Division after consultation with the resident practitioners and subject to certain conditions mutually agreed upon and embodied in a legal agreement. The meeting considered this a most satisfactory arrangement.

Fees for Life Insurance Examinations.—Dr. MACKAY announced that in the case of one of the insurance offices whose fee the Division had previously decided should be one guinea, having tendered only half a guinea, he had referred the office to the decision of the members, and in consequence the full amount of one guinea had been received.

An Unregistered Dentist.—The SECRETARY read a correspondence with the unregistered dentist whose case was mentioned at last meeting. A discussion followed, and it was agreed that while any serious emergency should be treated, great care ought to be taken by members to avoid any suggestion of association or co-operation in his work.

Certificates from Hospitals.—The circular of the Hospitals Committee re "Certificates from Hospitals" had been forwarded to the two infirmaries in the Division, and the replies received had been transmitted to the Medical Secretary, and acknowledged by him.

Medical Inspection of School Children.—The report of the Medico-Political Committee on the medical inspection of school children was fully discussed, and the Secretary was instructed to answer the questions in accordance with the decision of the meeting, as follows:

1. (a) This Division, having decided upon whole-time officers, considers the payment of same can only be settled upon a fixed annual salary.

2. Agreed that treatment of school children found defective should be paid for by case at fees according to the local rates of professional charge.

3. That the local practitioners should be asked to treat the cases, or if any hospital treatment is required to advise the same. School clinics not favoured by Division. No special practitioner to be selected.

4. When parents cannot afford to pay, the Education Committee should be responsible for any fees incurred.

Public Health Committee.—The following answer to the questions propounded in this Report was agreed to:

In this Division the medical officers of health are all general practitioners, and unless the area were rearranged, and only one or two officers appointed, a whole-time officer could not be supported. The scanty population and rural districts seem better served as at present.

Rheumatoid Arthritis.—Dr. WILSON (Glanton) read a most interesting and instructive paper on rheumatoid arthritis. The CHAIRMAN expressed the thanks of the meeting, and a discussion followed in which several members took part. The members were afterwards entertained by the Chairman.

SOUTH MIDLAND BRANCH: NORTHANTS DIVISION.

On January 26th a meeting of the Division was held in the Board Room of the Northants General Hospital. The meeting was preceded by luncheon at Franklin's Restaurant. Mr. C. J. EVANS was in the chair, and the other members present were: Drs. McCrindle, Odgers, Linnell, Greenfield, Terry, Darley, J. S. Stewart, Grindon, Jacobs, Robb, Baxter, Burt, Hichens, Harries-Jones, Milligan, Godwin, Stone, Pearson, and Pemberton.

Confirmation of Minutes.—The minutes were read and confirmed.

Results of Operative Treatment for Cancer.—Dr. THOMAS WILSON (Birmingham) then kindly gave a very interesting address on "The Results of Operative Treatment for Uterine Cancer." He emphasized the fact that, despite all the research there had been, the real cause of cancer was not known, but it was known that it was at first local, and then spread externally to the surface and internally through the lymphatic spaces to the lymphatic glands. In cervical cancer the parametrium at the base of the

broad ligament was very early involved, and the lymphatic gland early in two-thirds of the cases, but only one-third of these showed cancer cells on microscopic examination. As regards operation, improvement in results might be expected from earlier recognition of the disease or from wider operation. Unfortunately the really early stage was probably unrecognizable, what were called early symptoms being really a sign of an advanced stage of the disease. Wider operations can be made by the abdominal route, but at present the mortality was much higher than by the vaginal route. From 1896 to 1908 he had operated on 103 cases of uterine cancer—62 vaginal operations, with 1 death; 41 abdominal operations, with 10 deaths. In considering final results, he took five years' freedom from recurrence as equivalent to a cure. In taking them till the end of 1903, he found that 40 cases were still alive and strong (about 27 per cent.). He found 40 out of 107 cases seen justified an operation in a little over 20 per cent. He thought the best results in the future would be obtained from the abdominal operation. He then emphasized the importance of paying attention to the earliest symptoms. The paper was discussed by Drs. STONE, MULLIGAN, and HICHENS, and Dr. WILSON was heartily thanked for his kindness in coming from Birmingham and delivering so interesting an address.

Annual Representative Meeting.—Dr. BAXTER then read a valuable report of the Representative Meeting of last summer.

Revision of Divisional Rules.—The question of revising the Divisional rules was then discussed, and on the motion of Dr. HICHENS, seconded by Dr. BAXTER, they were referred to the Divisional Council for consideration.

Medical Inspection and Treatment of School Children.—The medical inspection and treatment of school children was then discussed at considerable length by many members, and the Division unanimously passed the following resolutions, which were proposed by Dr. HICHENS, seconded by Dr. LINNELL:

1. That whole-time officers be appointed at an annual salary.
2. That, as regards the treatment of school children, the Division does not feel that enough is yet known on the subject to enable it to come to any definite or useful conclusion.

Friendly Societies and the Medical Profession.—A letter was read from Mr. Smith Whitaker inviting the Division to send a delegate to a Charity Organization Conference on Friendly Societies and the Medical Profession. It was not found possible to appoint a delegate.

Proposed Alteration of Boundaries of Divisions.—A letter was then read from Dr. Larking of Buckingham, asking whether the Division would consent to an alteration of its boundaries—diminishing its size and enlarging the Aylesbury Division. The matter was referred for consideration to the Divisional Council.

Midwives Act.—The following resolution, proposed by Dr. BAXTER, seconded by Dr. MILLIGAN, and supported by Dr. ROBB, was passed unanimously, and sent to the Central Council for consideration at its meeting on January 27th:

The meeting of the Northants Division urges on the Central Council the desirability of approaching the Departmental Committee, now sitting, to consider the working of the Midwives Act, with a request for direct representation of the British Medical Association on the Central Midwives Board.

During the meeting tea was kindly provided for the members by the Chairman.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH.—The winter clinical meeting of the Edinburgh Branch will be held in the Royal Infirmary, Edinburgh, on Friday, February 26th, at 4 p.m. The members of the other Scottish Branches are invited to attend the meeting. The museum will be open at 11 a.m., and special clinics will be held during the forenoon. Dinner in the Royal British Hotel.

Princes Street, at 6.30 p.m.: morning dress; dinner ticket, 5s.—
A. LOGAN TURNER, FRANCIS D. BOYD, Honorary Secretaries.

LANCASHIRE AND CHESHIRE BRANCH.—The Branch Council will meet at the Medical Institution, Liverpool, on Wednesday, February 10th, at 4.30 p.m.—F. CHARLES LARKIN, Honorary Secretary.

LANCASHIRE AND CHESHIRE BRANCH: ALTRINCHAM DIVISION.—A general meeting of the Division will be held at 5 p.m. on Wednesday, February 17th, at the Brooklands Hotel. The meeting will be a special meeting under Rule 14, for the purpose of amending Rule 8 (election of Representative), and of considering the adoption of new rules (namely, "Bradford" Rule, and Rule Z), copies of which have been sent by post to each member. In the ordinary meeting Dr. Rhodes will read a paper, and the usual general business will be taken.—T. W. H. GRISTANG, Honorary Secretary.

LANCASHIRE AND CHESHIRE BRANCH: MANCHESTER (WEST) DIVISION.—A meeting of this Division will be held at the Technical Institute, Trafford Road, Old Trafford, on Tuesday next, February 9th, at 4 p.m. Members are urgently requested to attend.—J. SEARDON PROWSE, L. E. STANTON, Honorary Secretaries.

LEINSTER BRANCH.—The annual general meeting will be held on Saturday, February 13th, in the Royal College of Physicians, Kildare Street, Dublin, at 4.30 p.m. The annual dinner will be held in the College Hall at 7.30 p.m. of the same day.—ARTHUR H. WHITE, Honorary Secretary.

MIDLAND BRANCH: LEICESTER AND RUTLAND DIVISION.—A meeting of the Division will be held at the Leicester Infirmary on Wednesday, February 10th, at 4 p.m. Agenda: Minutes of previous meeting. Discussion of certain questions relating to medical inspection of school children. Paper by Dr. R. W. W. Henry on Some of the Commoner Affections of the Eye and their Treatment. Cases illustrating the subject of the paper will be shown. Any other business.—WILFRED E. GIBBONS, Honorary Secretary, Leicester.

SOUTH-EASTERN BRANCH: FOLKESTONE DIVISION.—A meeting of the Folkestone Division will be held at the Hotel Wampack, Folkestone, on Saturday, February 13th, at 8.15 p.m. Agenda: (1) The Division is requested to express its opinion for or against the following proposition: "That medical officers of health should be debarred from engaging in private practice"; and to add any qualifications, comments, or additional suggestions bearing on the matter which it may desire. (2) Medical inspection of school children (system of payment). (3) A letter from the Secretary of the Branch re police fees. (4) As to the advisability of dividing the South-Eastern Branch. All members of the South-Eastern Branch are invited to attend and introduce professional friends.—P. VERNON DODD, Honorary Secretary, Folkestone.

SOUTH MIDLAND BRANCH: BEDFORD AND HERTS DIVISION.—A meeting of the Division will be held at Bedford County Hospital, Bedford, at 3 p.m., on Thursday, February 11th, Dr. S. F. Dixon in the chair. Agenda: (1) Minutes. (2) Revision of Divisional Rules. (3) Consideration of the Report of Medical-Political Committee on the Medical Inspection of School Children. Members wishing to read papers or show cases are requested to communicate with the Secretary as soon as possible.—E. H. COBB, Honorary Secretary, Belmont, Stevenage.

STAFFORDSHIRE BRANCH.—The second general meeting of the session will be held at the North-Western Hotel, Stafford, on Thursday, February 25th. The President, Dr. S. King Alcock, will take the chair at 5.15 p.m. Business: (1) Minutes of the last ordinary general meeting. (2) Correspondence. (3) Exhibition of living cases. (4) Paper: Mr. A. B. Crisland, Internal Squint in Children. (5) Paper: Mr. J. T. Hartill, Short Notes on a Rare and Interesting Case of Retention of Menstrues, and Operations for and Relief of the Symptoms. (6) Exhibition of pathological specimens, etc. Dinner 7.15 p.m., charge 5s.—G. PETGRAVE JOHNSON, Honorary General Secretary, Stoke-on-Trent.

Vital Statistics.

THE REGISTRAR-GENERAL'S ANNUAL REPORT.

THE vital statistics of England and Wales for the year 1907 are shown in detail, and are fully analysed in the Annual Report just published by the Registrar-General. Provisional numbers of marriages, births, and deaths, tabulated from the quarterly returns made by the local registrars, were available in May last, when they were published in the Registrar-General's Annual Summary; the present volume, however, is compiled from the individual entries in the

registers, and the figures are much more fully discussed than was possible in the earlier publication. Additional tables have been included in this report giving rates of mortality from certain causes in several foreign countries; and appended to the Report is a note showing a new method of estimating populations for parts of the country in intercensal years.

MARRIAGE-RATE.

The number of marriages registered in England and Wales during 1907 was 276,421, being equal to an annual rate of 15.8 persons married per 1,000 of the total population, which was estimated to be 34,945,600 persons in the middle of the year. This rate is somewhat higher than the average thirty years earlier (1876-80), but if the rates are calculated on the marriageable population—that is, unmarried and widowed persons above 15 years of age—and are further corrected for differences in the age-constitution of this population at the two periods, it will be found that the marriage-rate has declined by 10.4 per cent. It may also be noted that, although the proportion of remarriages among both widowers and widows has greatly declined, remarriages of divorced persons are much more numerous than they were formerly.

BIRTH-RATE.

The births registered in England and Wales during the year under notice numbered 918,042, and were at the rate of 26.3 per 1,000 of the total population. Since 1876 the birth-rate has declined almost uninterruptedly, and in 1907 the rate was, for the tenth year in succession, the lowest on record since 1837, in spite of the fact that until 1875 birth registration was incomplete. Among the several counties the lowest legitimate birth-rates were recorded in Sussex, Surrey, Devonshire, and Hampshire; and the highest rates in Northumberland, Staffordshire, Glamorganshire, Durham, and Monmouthshire. Generally speaking the fertility of wives in rural districts is about 7 per cent. greater than that of wives in towns. The decrease in the total birth-rate already referred to has been accompanied by a still greater decrease in the proportion of illegitimate births; such births, which in 1876-1880 were at the annual rate of 14.4 per 1,000 unmarried and widowed females aged 15 to 45 years, had declined to 7.8 per 1,000 in 1907. Compared with other European countries England and Wales had in 1901-5 a higher birth-rate than Belgium, Sweden, Ireland, or France.

DEATH-RATE.

The number of deaths registered in England and Wales in 1907 was 524,221, corresponding to a rate of 15.0 per 1,000 of the population; this rate is the lowest on record, being 1.7 per 1,000 below the mean rate for the ten years 1897-1906. The death-rates in the several counties, after correction for differences of sex and age constitution of their respective populations, ranged from 9.7 in Radnorshire, 10.5 in Rutlandshire, 11.0 in Huntingdonshire, 11.2 in Buckinghamshire and in Westmorland, and 11.4 in Northamptonshire, to 16.7 in Monmouthshire, 16.8 in the West Riding of Yorkshire, 17.2 in the North Riding, 17.4 in Glamorganshire, 17.8 in Durham, and 18.8 in Lancashire.

The proportion of deaths among children under 1 year of age to registered births was equal to 118 per 1,000, against an average of 145 per 1,000 in the ten preceding years. The rate for 1907 is the lowest on record, the saving of infant life being most marked in the third quarter of the year, when the rate of infant mortality fell to the remarkable figure of 99 per 1,000, or 88 less than the decennial average; among the several counties the rates ranged from 77 in Wiltshire and in Dorsetshire, 80 in Hertfordshire, 83 in Berkshire, and 84 in Buckinghamshire, to 133 in Staffordshire, 135 in Durham, 136 in Glamorganshire, 138 in Lancashire, and 146 in Nottinghamshire.

Of the 524,221 deaths, the causes of 480,151 were certified by registered medical practitioners; inquests were held in 36,474 cases, while the causes of 7,596 deaths were not certified. The proportion of uncertified deaths is, however, steadily declining, and in 1907 was the lowest on record.

CAUSES OF DEATH.

With regard to the more important causes of death, it appears that much of the saving of life represented by the low death-rate of 1907 was due to the lessened fatality of diarrhoeal diseases, a result in a large measure of the cool

and showery summer of that year. Among the principal epidemic diseases the mortality from measles exceeded the average; from diphtheria it was somewhat below the average; while from scarlet fever and from enteric fever it was the lowest on record. From tuberculous diseases the mortality was less than the average, and it is observed that for the first time in the last fifteen years the mortality from cancer showed a decline from that in the year immediately preceding. The death-rate from influenza was 265 per million living, which is higher than that in any other year since 1900. Pneumonia caused a death-rate of 1,344 per million living, the rate in the selected urban counties being 1,588 per million, against 871 in the selected rural counties. The death-rate from phthisis for both sexes was 1,140,—for males 1,341, and for females 952 per million, all these rates being slightly lower than the average. From cancer the mortality was 2,401 per million among males above 35 years of age, 3,033 per million among females of the same ages, and 2,734 for both sexes, the excess in women being due to their greater liability to fatal cancer of the generative and mammary organs; all these rates are slightly in excess of those for the quinquennium, 1902-06. The recorded mortality from alcoholism continues to decline, the rate in 1907 among persons above 25 years of age being only about 70 per cent. of that in the previous ten years.

In 48,979 cases the causes of deaths were described too indefinitely to admit of their proper classification. Such cases would have been still more numerous but for the inquiries addressed to medical practitioners respecting deaths certified as due to tumour, dropsy, gangrene, hæmorrhage, etc. With reference to the deaths in the year under notice, 4,166 replies to such inquiries were received, and in many instances enabled the deaths to be referred to their appropriate headings. For example, 587 deaths were transferred from indefinite causes to malignant disease, 504 to tuberculous diseases, and 117 to puerperal septic diseases.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 7,651 births and 5,665 deaths were registered during the week ending Saturday last, January 30th. The annual rate of mortality in these towns, which had been 17.5, 16.6, and 17 per 1,000 in the three preceding weeks, rose again last week to 18.0 per 1,000. The rates in the several towns ranged from 5.2 in Hantsworth (Staffs), 6.8 in Willesden, 8.0 in East Ham, 9.3 in Hornsey, 9.9 in Barrow-in-Furness, and 10.5 in Wallasey, to 23.5 in Liverpool, 23.6 in Sunderland, 23.7 in Oldham, 23.9 in Manchester, 24.2 in Wigan, 26.4 in Bury and in Huddersfield, and 30.8 in Swansea. In London the rate of mortality was 17.8 per 1,000, while it averaged 18.1 per 1,000 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.5 per 1,000; in London the rate from these diseases was 1.6 per 1,000, while among the seventy-five other towns the rates ranged upwards to 3.1 in West Ham, 3.3 in West Hartlepool, and 3.9 in Sunderland, and in Merthyr Tydfil, 4.0 in Warrington, 4.3 in Rotherham, 4.4 in Bury, and 5.9 in Middlesbrough. Measles caused a death-rate of 2.0 in Sheffield, 2.2 in Warrington, 2.3 in West Ham and in Sunderland, 2.4 in Hornsey, 2.6 in West Hartlepool, and 3.0 in Wigan. Diphtheria of 1.3 in Merthyr Tydfil, 1.4 in Warrington, and 1.9 in Tynewydd; and whooping-cough of 1.1 in Walthamstow and in St. Helens, 1.2 in Wigan, 1.6 in Swansea, and 2.6 in Bury. The mortality from scarlet fever, from enteric fever, and from diarrhoea was not excessive in any of the large towns, and no fatal cases of small-pox were registered during the week. The number of scarlet fever cases remaining under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital had been 3,397, 4,079, and 3,211 at the end of the three preceding weeks, had further declined to 3,201 at the end of last week; 339 new cases were admitted during the week, against 323, 358, and 379 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

DURING the week ending Saturday last, January 30th, 934 births and 616 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 18.3 per 1,000 in the two preceding weeks, fell again to 17.2 per 1,000 last week, and was 0.8 per 1,000 below the mean rate during the same period in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 11.6 in Leith and 11.7 in Perth to 18.0 in Glasgow and 18.5 in Dundee. The death-rates from the principal infectious diseases averaged 2.0 per 1,000 in these towns, the highest rates being recorded in Glasgow and Dundee. The 301 deaths registered in Glasgow included 2 which were referred to scarlet fever, 7 to diphtheria, 26 to whooping-cough, 3 to enteric fever, and 9 to diarrhoea. Two fatal cases of diphtheria, 5 of whooping-cough, and 5 of diarrhoea were recorded. Aberdeen 3 of whooping-cough in Paisley; and 2 of diarrhoea in Edinburgh and in Greenock.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, January 30th, 730 births and 492 deaths were registered in the twenty-two principal urban districts of Ireland, as against 597 births and 473 deaths in the preceding period. The annual death rate in these districts, which had been 20.4, 21.4, and 21.6 per 1,000 in the three preceding weeks, rose to 22.5 per 1,000 in the week under notice, this figure being 4.5 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 25.4 and 19.7 respectively, the figures in other districts ranging from 8.3 in Portlaoine and 6.9 in Armagh to 34.5 in Kilkenny and 47.9 in Dundalk, while Cork stood at 25.3, Londonderry at 20.5, Limerick at 17.8, and Waterford at 23.4. The zymotic death-rate in the twenty-two districts averaged 1.6 per 1,000, as against 1.5 per 1,000 in the preceding period.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

THE following appointments have been made at the Admiralty: Fleet Surgeon F. H. MEADEN, to the *Tenedos*, January 25th; Staff Surgeon A. J. LAURIE, to the *Warrior*, January 25th, and on recommissioning, February 22nd; Fleet Surgeon W. G. K. ELLIOTT, M.D., to the *Clyde*; Fleet Surgeon D. J. P. McNAB, to the Royal Marine Depot, Deal, February 17th; Surgeon A. R. FISHER, to the *Juniper*, February 3rd.

Mr. W. J. J. ARNOLD, civil practitioner, has been appointed Surgeon and Agent at St. Helena.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

THE undermentioned Captains are promoted to be Majors, dated January 28th: T. H. M. CLARKE, C.M.G., D.S.O., M.B., F. W. P. V. MARRIOTT, S. L. CUMMINS, M.B., P. MACKESSACK, M.B., H. L. W. NORRINGTON. Majors Clarke and Marriott were appointed Surgeon-Lieutenants, January 28th, 1897, and made Captains, January 28th, 1900; Major Cunningham, Mackessack, and Norrington were appointed Surgeon-Lieutenants, July 28th, 1897, and Captains, July 28th, 1900. Their war records are as follow: Major Clarke—Kandia, 1898, being present at the affair of September 8th, when he was slightly wounded (mentioned in dispatches and appointed D.S.O.); Major Cummins—Nile expedition, 1898, and present at the battle of Khartoum (mentioned in dispatches, British medal, and Egyptian medal with clasp); Nile expedition, 1899 (clasp to Egyptian medal); occupation of the British colonial Province, Sudan, 1902-07; operations at Jebel Jerok in Southern Sennar, Sudan, 1904 (clasp to Egyptian medal). Majors Mackessack and Norrington—Nile expedition, 1898 (British and Egyptian medals).

Lieutenant J. A. CLARK, M.B., from the Seconded List, to be Lieutenant, January 29th. He was appointed on probation, August 1st, 1908.

ROYAL INDIAN MEDICAL SERVICE.

LIEUTENANT W. H. HAMILTON to be Captain (provisionally), February 1st, 1908. He was appointed Lieutenant, February 1st, 1905.

The retirement from the service of the undermentioned officers, which has been already announced in the *British Medical Journal*, has received the approval of the King: Colonel H. B. BRIGGS, Bombay; Lieutenant-Colonel CHARLES MONK, Bombay.

SPECIAL RESERVE.

ROYAL ARMY MEDICAL CORPS.

CAPTAIN GEORGE LANE, from the late Royal Army Medical Corps (Militia), having assented to be transferred, is appointed an officer of the Special Reserve of Officers from September 20th, 1908, retaining the rank and seniority which he held while in the Militia.

TERRITORIAL FORCE.

INFANTRY.

SERGEON-LIEUTENANT J. A. KITE, the Hertfordshire Battalion The Bedfordshire Regiment, resigns his commission, December 22nd, 1908.

ROYAL ARMY MEDICAL CORPS.

Captain R. H. HENDERSON, M.D., resigns his commission, December 11th, 1908.

Hospitals and Asylums.

BELFAST HOSPITAL FOR SICK CHILDREN.

The thirty-sixth annual meeting of this institution was held at the hospital, Queen Street, on January 28th. The Lord Bishop presided. Mr. T. S. Kirk, Honorary Secretary to the Medical Staff, read the medical report; 237 medical and 406 surgical patients had been treated in the wards; 375 operations had been performed; in the out-patient department 12,069 attendances had been registered, and 421 operations performed; 28 deaths had occurred in the wards. The General report made feeling reference to the loss the hospital had sustained in the death of Dr. Sidney Brice Smyth, and to the fund of over £1,000 which had been raised by his many friends to endow a cot which was named after him.

MANCHESTER ROYAL EYE HOSPITAL.

The annual meeting of the Royal Eye Hospital was held last week under the chairmanship of Mr. P. W. Kessler, the chairman of the Board of Management. The report stated that the enlargement of the hospital commenced two years ago was nearly completed, and that part was already occupied. It was not proposed to furnish and equip the whole of the new buildings at once, but to proceed gradually as the needs of the hospital required. The funds subscribed had so far proved insufficient to pay for the whole of the new buildings. Fortunately several legacies and donations of some considerable amount had been received during the period of the construction, and the annual meeting was asked to sanction the use of these for the building fund in order to obviate the necessity of any encroachment on invested funds. The enlarged hospital will require a considerably increased expenditure, probably amounting to £1,200, not only on account of the larger number of patients, but on account of the increased staff that will be necessary. It has been decided to appoint a third house-surgeon, and the nursing and domestic staff will also need reinforcement. The expenditure on the year's working exceeded the income by £358. The subscriptions amounted to £2,135, which was a slight increase. An appeal had been made to the public for £20,000, of which about £15,000 had been received. It was, however, expected that quite £25,000 would be needed altogether. With the enlargement the hospital will be the largest special eye hospital in England, the Moorfields Hospital in London having only 140 beds, compared with 160 in Manchester. The number of out-patients during the year was 31,793, which is a decrease of 850. The number of in-patients admitted was 1,553, an increase of 30. The accident cases treated at the hospitals in Oxford Road and St. John Street amounted to 9,140, which is an average of 29 per day. It was announced that Dr. Glascott, who has been intimately connected with the hospital for over forty years, had been appointed Honorary Surgeon. Vice-Chancellor Hopkinson said that the position of Manchester was unique in that it possessed a splendid group of hospitals, all in close proximity to the medical school, and he acknowledged, on behalf of the university, the great benefits derived from the opportunities of study in the Eye Hospital given by the Board of Management to the university.

BRADFORD CHILDREN'S HOSPITAL.

The report presented to the annual meeting of this hospital showed an increase of work in all departments. The total in-patients for the year numbered 635, an increase of 78 on the previous year; and of out-patients there had been an increase of 384 with attendances amounting to 17,457. The average cost per occupied bed was £62 15s. 9d. Continued care was exercised in regard to the admission of patients, and the board was satisfied that there were very few cases of hospital abuse.

DOWN DISTRICT LUNATIC ASYLUM, DOWNPATRICK. The annual report for 1907 of Dr. M. J. Nolan, the medical superintendent of this asylum, shows that on January 1st, 1907, there were 721 patients in residence, and that on the last day of the year there were 725. The total number of cases under care during the year was 879, and the average number daily resident 723 as compared with the average of 711 for the previous year. During the year 158 cases were admitted, of whom 123 were first and 35 not-first admissions. The attacks in 64 were

first attacks within three and in 24 more within twelve months of admission; in 34 not-first attacks within twelve months of admission; in 25, whether first attacks or not, of more than twelve months, and in 13 of unknown duration on admission. They were classified according to the forms of mental disorder on admission into:—Mania of all kinds, 52; melancholia, 101 (acute melancholia, 61); dementia of all kinds, 9; general paralysis, 4; epileptic insanity, 4; and congenital or infantile defect, 3. The considerable proportion of cases of acute melancholia and the small proportion of the graver forms of mental defect in the above list is noteworthy. As to the principal supposed causal factors which had been operative in these cases, alcohol was assigned in only 11, or 7 per cent.; venereal disease in 2, critical periods in 12, privation and starvation in 5, various bodily diseases in 29, and mental and emotional stress in 17. Hereditary influences were ascertained in 63, or just under 40 per cent., but congenital defect was only recorded as cause of the mental disorder in 1. During the year 71 were discharged as recovered, giving a recovery-rate on the admissions of 44.9 per cent., 8 as relieved, and 1 as not improved. Also 74 died during the year, giving a death-rate on the average numbers resident of 10.2 per cent. The deaths were due in 18 to cerebro-spinal diseases, including 7 deaths from general paralysis; in 59 to chest diseases, with 11 from pulmonary consumption; in 3 to abdominal diseases, and in 3 to cancer. All deaths were due to natural causes.

The asylum was visited by a particularly severe epidemic of influenza, which carried off many senile and feeble cases, and raised the death-rate by 2.5 per cent. as compared with the previous years. There were also a few cases of German measles and one of enteric fever. Both asylum dysentery and pulmonary consumption, however, showed a decline as compared with former years. The Inspector of Lunatics in his report calls attention to the frequency with which zymotic diseases of various kinds visited this asylum, and holds accountable for this the unsatisfactory water supply.

BRIGHTON THROAT AND EAR HOSPITAL.

At the annual meeting of the governors of this hospital, held on January 30th, the Mayor of Brighton in the chair, it was announced that the number of in-patients in 1908 was 335; number of out-patients 1,575. The total receipts in the general fund were £1,064 14s. 3d., and the total expenditure was £1,035 11s. 2d.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column, advertisements must be received not later than the first post on Wednesday morning.

VACANCIES.

BATH ROYAL UNITED HOSPITAL.—House-Physician. Salary, £80 per annum.

BRIGHTON WATER HOSPITAL.—House-Surgeon. Salary at the rate of £80 per annum.

BRIGHTON DISPENSARY.—Resident Medical Officer. Salary, £150 per annum.

CHELTEMHAM GENERAL HOSPITAL.—Surgeon-in-Charge for Branch Dispensary. Salary, £80 per annum.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST. Victoria Park, E.—House-Physician (male). Salary at the rate of £50 per annum.

DERBY COUNTY ASYLUM. Mickleover.—Junior Assistant Medical Officer (male). Salary, £120, rising to £150, per annum.

DEVONPORT: ROYAL ALBERT HOSPITAL AND EYE INFIRMARY.—Assistant Resident Medical Officer. Salary at the rate of £50 per annum.

DUDLEY: GUEST HOSPITAL.—Senior Resident Medical Officer. Salary, £100 per annum.

BIRTH.

HOAR.—On December 18th, 1908, at Bolarum, Deccan, India, the wife of J. E. Hoar, R.A.M.C., of a son.

MARRIAGE.

STEWART-MITCHEL.—On Tuesday, February 2nd, 1909, at the Church of All Saints, Margaret Street, W., by the Rev. Edward H. Mosse, M.A. (cousin of the bridegroom), James Stewart, B.A., Q.U. Bell, F.R.C.P. Ed., ex-Surgeon R.N., of 24, Welbeck Street, W., and only son of the late Robert Stewart, M.D. (Medical Superintendent of the Belfast District Asylum, to Edith Alberta, second daughter of the late George Haslett Mitchell, Esq., of St. Helen's, Bunratera, Co. Donegal.

DEATH.

REAP.—On January 28th, suddenly, at 11, Petersham Terrace, S.W., Thomas Lawrence Reap, M.R.C.S., aged 76 years.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON. 11, Chandos Street, Cavendish Square, W., 9 p.m.—Clinical Evening. Cases will be in attendance at 5 p.m.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C., 12 noon.—Museum Demonstration by Professor Shattock: Osteoplastic Inflammation of Bone.

TUESDAY.

BRITISH MEDICAL BENEVOLENT FUND.—Meeting at the Royal College of Physicians, London, Sir John Thwaites in the chair. Address by the Bishop of Oxford (Dr. Fasel).

ROYAL SOCIETY OF MEDICINE:

SURGICAL SECTION, 20, Hanover Square, W. 5.30 p.m.—Papers:—Mr. J. F. Dobson and Mr. J. Kay Jamieson: The Lymphatics of the Colon. Mr. Rickman J. Godlee: The Torus Palatinus.

WEDNESDAY.

ROYAL SOCIETY OF MEDICINE:

MEDICAL SECTION, 20, Hanover Square, W. 5.30 p.m.—Discussion on Ulcerative Colitis (adjourned from January 26th) will be continued by Sir Patrick Manson.

UNITED SERVICES MEDICAL SOCIETY, Royal Army Medical College, Millbank, S.W. 5 p.m.—Clinical Demonstrations.

THURSDAY.

OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM, 11, Chandos Street, Cavendish Square, W. 8 p.m.—Clinical Evening: (1) Mr. N. Bishop Harman: (a) Finished Models of the Diaphragm Test; (b) Tobacco Amblyopia—a Substitute for Smoking. (2) Mr. A. Levy: Obstruction of Cilio-retinal Artery. (3) Mr. J. F. Cunningham: A Case of Aniridia. (4) Mr. E. Nettleship: Ophthalmoscopic Drawings.

ROYAL SOCIETY OF MEDICINE:

OBSTETRICAL AND GYNÆCOLOGICAL SECTION, 20, Hanover Square, W. 7.45 p.m.—Specimens:—Dr. Herbert Spencer: A Venous Aneurysm on a Uterine Fibroid. Mrs. Stanley Boyd: A Neurotoxic Fibroid. Dr. Victor Bonney: A Modification of Champetier de Ribes's Bag. Dr. F. E. Taylor: A Uterus with Two Interstitial Fibroids, one showing Red Degeneration, the other Normal. Dr. Drummond Maxwell: Notes on a Case of Toxic Vomiting and Pregnancy. Short Communications:—Dr. P. J. McCann: Sarcoma of the Fallopian Tube. Dr. Russell Andrews: Some Cases of the Ovarian Mole in Combination with Ovarian Cysts, together with Cases Recorded. Paper:—Dr. G. F. Maeker: A Case of Hydatidiform Mole, with Abundantness of Kidney and Pregnancy: Sudden Death from Cardiac Failure.

FRIDAY.

ROYAL SOCIETY OF MEDICINE:

CLINICAL SECTION, 20, Hanover Square, W. 8 p.m.—Cases:—Dr. H. Morley Fletcher: Cases of Oxycephaly. Dr. Herbert P. Hawkins: Case of Leprosy. Mr. W. Sampson Handley: Elephantiasis Treated by Lymphaticoplasty. Mr. P. M. Heath: (1) Diffuse Peritonitis of both Tibiae without other Evidence of Constitutional Syphilis. (2) Congenital Syphilitic Knee. Dr. F. Parkes Weber: (1) Congenital Swelling of the Hands (Trophoedema). (2) Congenital Splenomegaly and Acholuric Jaundice. Dr. E. J. Poulton: An Idiopathic Family Idiocy. Dr. M. Macnaughton-Jones, jun.: An Automatic Appliance for Maintaining Pressure in carrying out Bier's Treatment. Mr. R. Higham Cooper: Aneurysm of the Uteral Bone. Cases:—8.30 p.m. Mr. Butlin will exhibit his collection of drawings of Early Carcinoma of the Tongue, and of conditions which may be mistaken for it; and will speak of the results of operation. Microscopic sections of the cases will be on view. 9.40 p.m. Mr. R. J. Godlee will describe a case of Dermoid Cyst of the Mediastinum treated by operation, which will illustrate the subject of this operation by a pathological specimen from another case.

POST-GRADUATE COURSES AND LECTURES.

CENTRAL LONDON THROAT AND EAR HOSPITAL, Gray's Inn Road, W.C.—Thursday, 3.45 p.m.: Lecture on Tracheo-scopy. Friday, 3.45 p.m.: Lecture on Clinical Pathology.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.—Wednesday, 4 p.m., Mediastinal Tumours.

LONDON SCHOOL OF CLINICAL MEDICINE.—Daily arrangements: Out-patient Demonstrations, 10 a.m.; Medical and Surgical Clinics, 2.15 p.m. and 3.15 p.m.; Medical Operations, 2 p.m. Special Clinics: Ear and Throat, at noon and 4 p.m., Monday, and noon, Thursday; Skin, at noon and 4 p.m., Tuesday, and noon, Friday; Eye, 11 a.m., Wednesday and Saturday; Radiography, 4 p.m., Thursday. Special Lectures: Wednesday, 3.30 p.m., Orbital Cellulitis. Thursday, 2.30 p.m., Jaundice.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chenies Street, W.C.—The following Clinical Demonstrations have been arranged for next week:—4 p.m., Monday, Skin. Tuesday, Medical. Wednesday, Surgical. Thursday, Surgical. Friday, Throat. Lectures at 5.15 p.m. each day will be given as follows:—Monday, Tricentral Neuralgia and its Treatment by Schloesser's Method. Tuesday, The Diagnosis and Treatment of Pus Formation in Appendicitis. Wednesday, Treatment of Psoriasis. Thursday, Perforating Ulcer of the Colon.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen's Square, W.C.—Tuesday, 3.30 p.m., Treatment in Nervous Diseases. Friday, 3.30 p.m., The Significance of Tremor.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.—Monday, Clinics, 10 a.m., Surgical Out-patient, 2.30 p.m., Medical Out-patient; Nose, Throat, and Ear: X Rays, 4.30 p.m., Medical In-patient. Tuesday, 10 a.m., Medical Out-patient Clinic, 2.30 p.m., Operations; Clinics: Surgical, Gynaecological, 4.30 p.m., Special Demonstrations. Wednesday, 2.30 p.m., Medical Out-patient, Skin, and Eye Clinics. Thursday, 2.30 p.m., Gynaecological Operations; Clinics: Medical Out-patient, Surgical Out-patient, 3 p.m., Medical In-patient; 4.30 p.m., Lantern Lecture: Applied Anatomy of the Breast and Diseases of the Male Breast. Friday, Clinic, 10 a.m., Surgical Out-patient; 2.30 p.m., Operations; Clinic; Medical Out-patient, Eye; 3 p.m., Medical In-patient.

POST-GRADUATE COLLEGE, WEST LONDON HOSPITAL, Hammersmith Road, London, W.—The following are the arrangements for next week:—Daily, 2 p.m.: Medical and Surgical Clinics: X Rays, 4 p.m., Operations. Monday and Thursday and Wednesday and Saturday, at 2 p.m.: Diseases of the Eyes. Tuesday and Friday, 10 a.m.: Gynaecological Operations. 2 p.m. (Wednesday and Saturday, 10 a.m.): Diseases of Throat, Nose, and Ear; 2.30 p.m., Diseases of the Skin. Wednesday and Saturday: Diseases of Children, at 10 a.m.; 2.30 p.m., Diseases of Women. Lectures: At 10 a.m., Monday and Thursday, Special Demonstrations of Surgical Cases. Friday, Medical Registrar, Demonstration of Medical Cases. At 12 noon, Monday, Pathological Demonstration. At 12.15 p.m., Wednesday and Saturday, Practical Medicine. At 5 p.m., Monday, Diagnosis of Swellings of Jaws. Tuesday, Diagnostic Signs in Organic Diseases of Nervous System. Spinal Cord. Wednesday, Medicine. Thursday, Cases of Eye Disease. Friday, Cases of Skin Disease.

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, Leicester Square, W.C.—Thursday, 3 p.m., Treatment of Syphilis.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

The British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the **BRITISH MEDICAL JOURNAL** is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association, and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the **BRITISH MEDICAL JOURNAL** for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

Conference

ON

FRIENDLY SOCIETIES AND THE MEDICAL PROFESSION

Convened by the Charity Organization Society.

A CONFERENCE of medical men and friendly societies, convened by the Council of the Charity Organization Society, was held in the Council Chamber, Denison House, Vauxhall Bridge Road, on Saturday, February 6th. Sir ALFRED LYALL presided, and there was a large attendance. Among those present were the following six members of the British Medical Association, nominated by the Council on a recommendation of the Medico-Political Committee to represent it: Drs. W. T. Lydall (Birmingham), A. E. Morison (Sunderland), Percy Rose (Stratford), J. H. Taylor (Salford), W. E. Thomas (Bridgend), and J. Smith Whitaker (Medical Secretary). In addition, there were present many Representatives of Divisions of the Association in various parts of the country. Among the representatives of friendly societies were:—*Ancient Order of Foresters*: Messrs. A. E. Rawlings, J. C. Martyn, H. J. May, T. W. Frew, E. G. Hollis, and W. Vincent. *Oddfellows*: Messrs. H. Hawkins, A. Pinhorn, and Wright. *Hearts of Oak*: Messrs. W. Bunn and G. Burgess. Among the representatives of the Charity Organization Society were Mr. C. S. Loch (secretary), Major-General Cumberland, and Lieutenant-Colonel Montefiore.

Dr. JAMES PEARSE (Trowbridge) read a paper on friendly societies and the medical profession, in the course of which he said that he spoke in a purely private capacity and had no mandate to speak for others. For fourteen years he had practised in a district where there was a large amount of contract work and had found the conditions so onerous and unsatisfactory that he had felt reluctantly compelled to resign his appointments. The relationship between friendly societies and the medical profession should be cordial and mutually helpful. The main object of friendly societies was the assistance of their members in sickness, that of the medical profession the alleviation of sickness. The two should work harmoniously together, and their common purpose would thereby be

better be attained, but no one could pretend that the relationship was cordial and harmonious. The medical journals during the past twenty years contained a reiterated story of the grievances of medical men. If the *Lancet's* "Battle of the Clubs" or the report of the British Medical Association on Contract Practice were read, they would be found to contain a chorus of complaint from every quarter of the kingdom. There had been dispute after dispute with friendly societies, but the question whether any common basis of agreement could be attained remained unsettled. Indeed, no attempt at reasonable discussion seemed to have been made; the opposing parties remained in hostile camps, each maintaining its own position, and there was no advance towards a compromise. He would ask the representatives of friendly societies who were present seriously to consider whether the complaints of medical men were justified, and whether anything could be done to remedy these. He asked this not only in the interests of medical men but in the interests of the members of the societies. The profession had no quarrel with friendly societies as such. The good work they had done was patent to all. Nor did the profession object to the principle that friendly societies should provide for the medical attendance on their members in sickness; it only demanded that in such provision it should be equitably treated. But as a matter of fact it objected strongly to the details by which this principle was carried out, and maintained that they were neither fair nor reasonable.

Adult Males.

Dealing first with adult males, he said that the usual method by which a friendly society arranged for medical attendance on its members was by the payment of an annual capitation fee to the practitioner. The amount of such fee varied. The recent investigation made by the British Medical Association comprised 1,641 clubs; of these 76.5 per cent. paid less than 5s., 23.5 per cent. 5s. or more. Taking as a basis 5s., though this was above the average, it followed that for a sum of 5s. for each member on his list, the practitioner must attend those members who were ill, and must also provide the necessary drugs and surgical dressings. The first contention of the medical profession was that this remuneration was wholly inadequate. With regard to the work demanded for this sum of 5s., he said that the Manchester Unity of Oddfellows, which comprised over 600,000 members, had lodges throughout the country, and its members were engaged in all varieties of

occupation. Its experience might therefore be taken as fairly typical. An elaborate actuarial report on the sickness incidence of this society for the five years 1893-7 had recently been published, from which it appeared that the annual average period of sickness per member exposed to risk was 2,344 weeks. A lodge of 100 members would experience during the year 234 weeks of sickness; the medical man would receive for attendance £25, or approximately 2s. per sick week. Was 2s. sufficient payment for a week's attendance? It was difficult to strike an average between acute and chronic cases, but, taking an estimate of two visits a week, was 1s. a visit sufficient remuneration for a medical man who might have to go three miles to his patient, perhaps in the middle of the night? When he had paid for the cost of drugs and surgical dressings, and the cost of driving, what sum did he put in his purse? Further, these figures applied only to members in receipt of sick pay. The large numbers who consulted a medical man for minor ailments also demanded consideration; at a low estimate these equalled those in receipt of sick pay. Therefore, the 1s. was reduced to 6d. a visit for consultation. Was this fair or reasonable? Was it just remuneration to a man who had spent years and means in attaining the knowledge necessary to the discharge of his duties? Was it likely to encourage him to discharge those duties efficiently and earnestly? The payment made by a member to his friendly society for sickness benefit was accurately adjusted to cover the risk involved, and was arrived at after careful actuarial investigation; the payment he made to cover the cost of medical attendance bore no proportion to the risk involved. Dr. Pearce had not been able to ascertain that any attempt had been made to adjust it scientifically; it was a purely haphazard guess, and he had shown that it was a faulty guess. But it was not only the mere lack of proportion in the fee of which the medical profession complained. There was this further injustice, that a member joining a friendly society at 40 paid for the same sickness benefit a larger contribution than one joining at 20, but he paid no more to the medical fund, though his risk of sickness was much greater. Was that fair? From the tables in the report already quoted it appeared that the lowest sickness rate occurred at the ages of 20 to 24, when it was 0.9 weeks; it rose steadily till at the ages 65 to 69 it was 10.59 weeks; now as 5s. did not cover the former risk, how much less did it cover the latter! Again, in cases of protracted illness the society took care of itself by reducing the amount of sick pay after a definite period; it ignored the injustice of expecting the medical man to continue in attendance for an absolutely indefinite period for the same remuneration; it halved its own obligations, but not the doctor's. Was this fair?

Wage Limit.

A further injustice of which medical men complained with much bitterness and reason arose in connexion with the fact that when the system was first instituted it was intended to apply to medical attendance on those who were in receipt of a limited wage, and to whom sickness meant a serious crippling of resources. To such the profession had always been willing to render assistance without considering too closely whether there would be an adequate return in money payment. It had reason to complain when advantage of such willingness was taken by those to whom sickness was not such a serious matter in a pecuniary sense, and who could afford to pay a reasonable fee for services given. It was an indisputable fact that the services of medical men were exploited by many who should be ashamed to offer their medical attendant the paltry fee of 5s. a year. This was a crying evil. In illustration of this he read the following quotations from the report of the *Lancet* Commissioner:

The principal manufacturer of the district, who pays some £600 or £700 a week in wages, is a member of the Oddfellows' Friendly Society, and Dr. Dash must attend him for 4s. a year. Nor is this a slight matter, for this manufacturer is suffering from haemoptysis. This patient is rich enough to keep hunters (p. 11). Yet, though this man was attended to his deathbed by his club officer, whose services he obtained for 4s. a year, it was found when his will was opened that he had left a fortune of £10,000 (p. 126).

There was another case of a man who drove his carriage and left £80,000 (p. 190). Was this fair? These might be extreme instances, but they drove home the point

that there was no limitation as to who might claim the services of the medical man at the society's fee. How the amount of fee to be paid was settled in the first instance he had been unable to ascertain. If there was any reason why it was sufficient then, there was abundant reason why it is insufficient now. The conditions of the profession had altered, there were whole fields of knowledge then unexplored with which the practitioner must now be conversant; it required constant and unremitting effort to keep in touch with fresh developments. Far more detailed work was required of the general practitioner than was the case a generation ago, and it was unreasonable to expect him to be content with this miserable pittance. The cost of medical education had considerably increased, and five years was the minimum time within which a medical diploma could be obtained. The matter could be argued from another side. It was a striking fact that the sickness incidence in friendly societies showed a marked tendency to increase. Taking the figures of the Manchester Unity and comparing the years 1893-7 with the years 1866-70 there was an increase of 21 per cent. up to 45 years of age, of 26 per cent. from 45 to 65, and over 65 of 42 per cent. Was it fair that with this increased demand on the doctor's services his remuneration should remain the same?

Women and Children.

Contract medical attendance was at first limited to adult males, and was undertaken as a concession to assist the wage-earner when his income was suspended by sickness, and in the expectation that the medical attendant would retain as private patients the family, for whom ordinary fees would be paid. Such expectations had been destroyed by the rapidly extending application of the same system to the wives and children of friendly society members. The payments for women and children were almost invariably lower than for men; juveniles might, indeed, pay as little as 2s. per annum. Their liability to sickness was much greater. By what method of reasoning could it be shown that the greater sickness demanded the lesser remuneration? The unfairness of this did not admit of argument, and it was amazing that any reasonable body of men should demand the best medical attendance for this paltry sum. He thought he had proved the contention that the complaints of medical men were justified, and that they were inadequately paid by friendly societies and in other respects unjustly treated; but he wished to emphasize the fact that it was far more than a monetary matter. Medicine was degraded to a sordid commercial bargain, with the constantly-recurring query in a case of illness, Does it pay? There should be in every case constant co-operation and sympathy between physician and patient; this spirit of mutual helpfulness was worth more than gallons of physic; there existed instead a sense of friction and irritation—on the part of the doctor the knowledge that he was being sweated, perhaps on the part of the sufferer the suggestion that he was not being treated as he would be were he a private patient. This was bad for him and bad for the doctor. Would it not be better that a man who was keen on his profession should want to have club practice, whereas, as a matter of fact, he wanted not to have it. If the present system was bad for the medical profession—and of that there could be no manner of doubt—it was bad to a like degree for the friendly societies. It was a moot question whether medical attendance could be satisfactorily contracted for, and, with increasing experience, he was himself coming to doubt it. The demands were so varied and the work required so complex that it did not seem possible to reduce it to a single figure to cover every contingency. It was very desirable that some more satisfactory system than the present should, if possible, be evolved. He submitted that he had shown that (1) the fee paid bore no relation to the work done. Some more accurate adjustment was surely possible. It seemed to him that it would be a feasible plan to arrange a given fee to correspond to each week of sick pay, and that at the end of the year the medical man should receive such sums as corresponded to the weeks of sick pay experienced by the members on his list. The payment, however, must take into consideration the attention given to members not ill enough to be laid aside. An alternative would be to adopt the system of a recognized payment for each item of work

done. So far as he knew, the National Deposit Friendly Society was the only one which had evolved a scheme on these lines, paying a given fee for each visit or consultation. He had no personal experience, but had heard medical men speak with satisfaction of its methods, and he could not say as much of any other friendly society. The fees, however, did not err on the side of liberality. Another excellent feature of this society was that a portion of the medical fee was paid from the member's deposit; hence there was some check on the member who haunted the doctor's house and had a strange appetite for physic, and there was an inducement to come off the sick list as soon as possible. (2) That medical men only expected to attend on any contract system those in receipt of a limited wage and who could not afford to pay the usual fees. The details of a wage limit were difficult to define, but the principle was essential. (3) If women and children were to be included in medical benefits, the payment must bear a truer proportion to the work required. In conclusion, he was ready to admit that he had expounded difficulties but had suggested no adequate solution. The problem was too difficult for it to be within the power of one man to find a solution. There were two sides to every question. While anxious to safeguard the interests of the profession, he recognized that the interests of the friendly societies had also to be safeguarded. Really the two should be identical. The matter should be approached in the light of reasonable discussion, and an honest endeavour made to arrive at a mutually satisfactory agreement. While he believed that the majority of medical men were anxious to work in harmony with the friendly societies, he was persuaded that if nothing were done an increasing number would decline to have part or lot in contract practice. The friendly societies suffered; they expended vast sums in sick pay to their members, but took little pains to consider the interests of those responsible for the health of these members. The medical profession suffered, but he would repeat that with it there was more than the money question. The profession was of course not indifferent to the pecuniary reward, but there were interests greater than this. Many a man who began his work with enthusiasm, found his professional life embittered by the evils of the contract system, which blighted his hopes, stifled his ambition, and destroyed his love of work. From each point of view, that of the public, that of the friendly societies, that of the medical profession, was there not reason for seeking amendment?

SIR THOMAS SMITH said he was present at the request of friends to express his deep sympathy with his professional brethren in connexion with their relation to friendly societies. There were some friendly societies which he understood treated their medical officers with liberality, and the relations between them were very cordial. There were some others where the medical officer was adequately remunerated. There were many more where grievances existed such as had been referred to by Dr. Pearse. One grievance was that people in a good social position took advantage of friendly societies, and were attended for a very small sum of money. These were mostly men who in their early career were perhaps artisans or workmen. This difficulty would continue unless the constitution of the old societies was altered. He did not think it was entirely the fault of the societies. Every one liked to get the most for his money, and even the manufacturer, if he could get free of his doctor's bill by paying 4s. a year, was very apt to take advantage of it. This very fact might be an indication of the means by which the individual had attained to his position. The difficulty was that there was no board of conciliation, no disinterested third party, to intervene and discuss the matter and help to settle it. The author of the paper had approached the subject in a friendly way; it was a burning question, but Dr. Pearse had not added fuel to the fire.

SIR THOMAS BARLOW said he would have hesitated to speak but for the fact that most of his life had been spent in hospitals, with the result that he had been brought in contact with doctors of every kind and degree in all ranks of life. Without any extravagance, he wished to say that there was no group of men engaged in the hard work of the world who did more towards helping their fellow creatures without any remuneration than the medical profession, not only amongst the poor but amongst the

rich, especially amongst those who had to maintain appearances and were yet on the edge of a financial precipice. Only the other day he was asked to see a case with a doctor, and he gathered by degrees that the father of the patient was a tradesman who was just on the verge of bankruptcy. His friend the doctor was attending the patient without any chance of remuneration, and paying a trained nurse in order to see that the patient recovered. That was not an exceptional thing. Every day of his life every doctor who was worth his salt was doing acts of kindness—and, moreover, acts that involved special science and skill—for his fellow-creatures, and for which he knew absolutely that he would never receive any remuneration whatever. He knew, too, that working men were always ready to evince a like spirit toward one another. They all rejoiced in growth of citizenship and self-help and mutual help in friendly societies and in all ranks of the working classes. It might be said that some of the work done by doctors for friendly societies was apprenticeship to gain experience. So it was, but the apprenticeship did not go on through the whole of life. There were many examples where medical men gave their work ungrudgingly as a matter of course, and nobody knew it was being done. He mentioned this because he wished to appeal to the sense of justice and right feeling on the part of the citizens of this country; he asked them to remember that the doctor's life was such that very often he did not get remunerated at the time, and he asked them in their particular way to strive to remunerate him when they had the chance in friendly societies. One of the most striking things that had happened in this generation was the improvement in the status of the working man. Whether or not they thought that trades unions had in some way hampered the development of industry in certain directions, they must admit that these unions had done a great deal to improve the status of the working man, and they rejoiced to think that the working man had come into his own. It was now admitted that a man who did his work deserved to have a living wage so as to be able to maintain himself and his family decently and to bring them up and get some little competence for old age. The working man had also the right to have some leisure and some time for reasonable refreshment. He would go a step further and say he thought all fair-minded people believed that as different trades improved and became more remunerative the working man's wages should also improve. The only way in which they could approach social problems satisfactorily was by trying to put themselves in other people's places. He would suppose he was addressing a number of skilled artisans, and he would ask them to look at the work and remuneration of the medical man who worked for a friendly society. There was not a great difference between the work of a doctor and that of a skilled artisan, and he was not ashamed to say that his work was that of a skilled artisan. He was willing to stand on the same footing as a skilled artisan. The doctor who did his work and knew his work deserved to have a living wage, so as to be able to bring up his children properly, and not only to educate them but to set aside a little money for a rainy day. But, alas! many medical men could not do it. The medical man also deserved to have a little rest. His nights were often disturbed, and he was expected at once to obey the demands made upon him just as much as any artisan who had nightwork to do. The doctor had both nightwork and Sunday work; therefore he deserved to have a little time for quiet, rest, and leisure. Furthermore, he ought to have some time to keep himself abreast of the work being done in the advance of medicine and surgery, and, if any improvement were made in the treatment of disease, friendly societies ought to have the advantage of it. Could a medical man get a living wage if he did nothing but club work? Could he get any leisure? In some towns he had to cover the whole of the ground, and the work he had to do in those clubs was often "dog's work"—absolute slavery. If no patients were left for private work, it was impossible for a medical man thus engaged to get anything like a living wage. What leisure was there for such a man? The Registrar General's Report showed that the mortality of doctors was something terrible. One reason for this was that medical men had very little time for their food. There was often a movable feast; they had to rush off

very often, and had long intervals between their eating and drinking, with the result that they often suffered from indigestion. It was very frequently in consequence of malnutrition that doctors' lives were shortened. He begged that the skilled artisans who worked friendly societies would consider the condition of the doctor and his claims for consideration in the same way that they themselves asked the masters and others to consider the claims of the artisans. 'Would it be very wrong when their friendly societies were working well and their doctors were doing their best, and their people were saved expense and looked after—would it be very wrong to allow for an accession of wage as a friendly society matter, just in the same way as, in connexion with the cotton trade in Lancashire, there was a sliding scale, so that when there were increased prospects of work they had better wages? He asked them to look at the matter from another point of view. A friendly society, they all agreed, was a right thing, the principle of insurance was a right thing, it was the only way in which people with limited means could pay their way for medical attendance. But it was based on the understanding that there was a sliding scale for people of limited means. They acknowledged and admitted in everything else that payment must be within certain limits, and must be relative to what people could afford. But surely the understanding was that as a man's means improved he should pay a proper legitimate price for what he got in the way of medicine and everything else. He would point out that in many friendly societies when men who had started as artisans and afterwards became manufacturers, or got into a position of comfort, and still remained in those societies, it was quite common for them not to claim sick benefits; but it was not common for them to allow the medical benefits to go by. There were exceptions, and he acknowledged it freely, but nobody could deny that there were frequent instances—chapter and verse could be given—of men in every place where there were clubs, men who were in receipt of large incomes accepting those medical benefits without any scruple. The laws of the friendly societies permitted it, and that fact was a damning fact, and if the thing were put on an equitable basis, on the kind of basis that the artisan desired with his employer in the matter of wages, then things would soon be put right as between medical men and friendly societies. He must say two other things before he sat down. It was more blessed to give than to receive, and when they could do an act of kindness to a fellow creature when he needed it and deserved it, there could be nothing but a good result on both sides. But if they gave money or services to somebody who could afford to pay for it, but who did not pay for it, they damaged both sides—they damaged society at large by it, and it was degrading and demoralizing. The other thing was this: If gentlemen having authority in friendly societies looked at the matter just to see how much they could get out of the medical man who worked for them—to get him to do it on the lowest possible terms—no doubt they could succeed. The occupation of a doctor in this country was not very remunerative at the present time, and until a change took place there would be a number of doctors whom they might succeed in inducing to enter on those terms and to do the work on starvation wages. But friendly societies in taking that course would not be doing the best for their own people; they would not get the best advice or the best skill for their own people, and they would have the feeling that they were lowering the whole tone of one of the most sacred professions in the world. He appealed to them to go back once more to the position of the skilled artisan in relation to his employer. It was not only a question of pounds, shillings, and pence, but a question of the feeling that existed between them. In the old days of strikes in Lancashire, what was the state of things between the workpeople and the employers? The masters hated the men and the men hated the masters, and there was nothing but bitterness between them. That was what would result from the attempt to get all that they could out of the medical man. They would not get good service; they would get nothing but bitterness and a state of things that tended to separate them, and the general outcome would be bad. Let them come together, meet man to man; let them meet in the same way as a great many of the best working people met the best employers;

let them see what each side had to say, and then surely it could not pass the wit of man, out of this very difficult problem, that some good working, honest, true, and righteous solution should be obtained.

Mr. P. W. MOFFREY (Parliamentary Agent, Manchester Unity Oddfellows) thought those present, and especially the friendly society members there, might congratulate themselves on the moderation of tone which distinguished Dr. Pearce's paper, although he for one did not agree with all his arguments. He was sorry he could not pay that compliment to Sir Thomas Barlow. A friendly society's practice was perhaps as important to the medical man as it was to the society. He was sorry to have to believe that a large number of those who now felt themselves independent, and were making provision for themselves would, were it not for the opportunity of a small periodical payment to their club for medical attendance, be driven to other sources. Those sources in many cases would be the parish, and in large towns the sources would be the free medical hospital or the dispensary. He believed that it would be better for doctors to have friendly societies practice as a corollary to their own practice than to divert it from them by any harsh stipulations as to the terms on which they would serve. It was important to friendly societies that the service given by the medical officer, who was one of the most important of their officers, should be willing and not grudging service. Service grudgingly given was not generally satisfactory service. He might say from his own experience of medical officers, which was not very large, that whenever he had had to call in a doctor, though he had paid regularly to the medical attendance he had not once had a bottle of physic or a word of advice from him. Sir Thomas Barlow had said it was a common practice for those more fortunately situated in life to take advantage of their medical men. He (Mr. Moffrey) put himself up as one example, and he had no doubt that he could find twenty more. Moreover, there was a very large number of men in clubs who were not over blessed with this world's goods, and who lived beyond the radius in which the doctor was bound to attend, and the majority of those men still continued to pay their club doctor, although they knew perfectly well that they could never have him. He believed that in London fully 50 per cent. of the members of friendly societies were in that position. It could be tested by actual statistics. A large number of the branches in London were situated in the centre, while members were driven perforce to live in the outskirts. Thus members paid their fee but did not receive anything beyond an occasional word of advice. He agreed entirely with all that could be said as to the unselfish labours which doctors gave to the community at large and the amount of work they were ready to put in without the slightest hope of payment, but he was not ready to admit for one moment that a wage limit was either proper or practicable. A man who chose to pay to his club for his medical man was entitled to that attendance as much as to his sick pay. But the point to be considered was the way in which both parties could be satisfied. If it were possible to act on Dr. Pearce's suggestion—that the societies should pay according to age—he for one would endeavour to assist in finding a satisfactory basis on which doctors could be paid. But at the present time he had not in his mind a method of establishing such a basis. He was not prepared to say with Sir Thomas Barlow that at present the position was one of friction between both parties. He knew there was a great deal of cordiality in many instances between doctors and their friendly societies; and, though it might be a mere pittance, the societies found that when a vacancy occurred others were ready to step in and carry on the work. Sir Thomas Barlow had said, Let the artisan pay the doctor as he would wish to be treated in his own employment. The artisan had done that. He could remember the time when the doctors were paid 2s. 6d. per annum. It might be a shame, but it was a fact, and the artisan recognized the shame by now paying 4s. or 5s. Could they not find some common basis of action by which the friction—though he did not deem it was general—where it existed could be removed? There was a body known as the National Conference of Friendly Societies, and it did endeavour at one time by consultation with representatives of medical associations to find some common ground on which doctors

and friendly societies could come together. But at that time the demands of the medical profession were deemed impossible by the friendly societies, and the conference came to nothing. They were willing to enter into consultation with the representative body of members so long as the doctors were ready to be reasonable, and not attempt to force on them any limitation as to a wage limit, or to tell them that they were treating the doctors unfairly. They were ready to pay a proper amount, and when the doctor agreed to take it, in return they expected proper attention, and happily they generally got it. He hoped that whatever consultation took place, the relation between doctors and friendly societies would be put on a proper basis for a generation to come.

Mr. C. W. BURNES (Secretary, Hearts of Oak Benefit Society) maintained that friendly societies had not yet been approached in a proper way by medical men, and when they were approached in a proper manner for a proper remuneration, the doctors would get that remuneration. If doctors wanted proper treatment, all they had got to do was to ask for it; and he was absolutely certain that they would get it from friendly societies. But had the friendly societies no complaint against the doctors themselves? If the General Medical Council would inquire into the medical qualifications of some doctors who gave certificates of illness, probably not only the medical profession would be directly affected, but it was perfectly certain that members of friendly societies and their friends would be immediately concerned. The gratitude of a number of friendly societies to medical men was pronounced, and emphatic, and profound. The medical profession had done noble work in the past; and that work would be continued by the most noble of all professions. But whilst there was very much to commend, there were also some reasons to condemn. It was by malingering dodges that frauds were effected, the fault lying with the doctors who were too ready to grant certificates for abstention from work without specially examining those who applied for them to ascertain whether they were really needed. Mr. Burnes concluded by stating that if the medical profession had any complaint to make against friendly societies and would make it in a legitimate way, it might be absolutely certain that the complaint would be legitimately met.

Mr. FRANÇOIS BUXTON said he was neither a member of the medical profession nor of a friendly society. There was no doubt that the question of the medical treatment of the poorer classes was coming very much to the front, and he hoped that before long something decisive would be done, especially after the issue of the report of the Royal Commission on the Poor Laws. The Metropolitan Provident Medical Association, of which he was chairman, had about twenty-one provident dispensaries throughout London with a total membership of men, women, and children of over 30,000. The pay was generally 6d. a man a month, and for each family—a man, his wife, and children, up to 14 years of age—1s. 8d. a month. The first object of the association was to encourage thrift and independence amongst workmen, and it sought to organize that large body of people who were not able to pay the ordinary amount for medical attendance, but who at the same time, if they were earning wages, ought not to go to the free hospitals of London and get advice and medical attendance for nothing. There was, he was afraid, a large body of people who were inclined in that direction, and his association was endeavouring to encourage a better and more independent feeling. There was, he was sure, every desire on the part of his association to do the best it could for the medical profession. It had a very large number of doctors in connexion with each one of its large dispensaries. Each one of the members might choose his own doctor, and he had never heard anything but the most friendly expressions from the doctors regarding the work and the moderate payments made. Doctors had to remember that a large number of the members of the friendly societies paid regularly for many years without giving any trouble to the doctors. On the other hand, the work for the doctors must be very hard, very continuous, and on the whole very unpaying in many directions; the work was hardly worth the pay. At the same time, they obtained experience, and he presumed that was one of the chief objects of a

doctor's profession for many years of his life. The doctors who worked for the Metropolitan Provident Association were themselves members of the local committee, and there were representatives from those local committees serving on the Central Committee, and one of every three representatives must belong to the medical profession. He could only express a most earnest hope that, so far from doing anything unfair to the doctor, the provident dispensary system might assist them by organizing that large body of people of whom he had spoken, so as to get for the medical men a certain amount of pay from those people who otherwise, he believed, would pay nothing.

Sir Alfred Lyall having to leave at this stage of the meeting, Sir EDWARD BRAEBROOK presided during the remainder of the proceedings.

Dr. GRAY, speaking both as a member of the Charity Organization Society and a medical man, pointed out that the present friction between medical men and the friendly societies was a source of danger. One or two speakers, from the point of view of the friendly societies, had rather minimized the fact of the friction. He had been a medical practitioner for fifteen years, and he felt that he was fortunate in not having anything to do with contract work. Medical practitioners as a body considered that the man who had no contract practice was very lucky. If they wanted to sell a practice and sell it easily, what did they advertise? They advertised that there were no clubs in the practice. A medical man, as a general rule, would do his very best not to have anything to do with contract work. Friendly societies were at present in much the same position as the War Office occupied a few years ago. At that time there were more vacancies in the Army Medical Service than there were candidates; but now there were two candidates for every vacancy, because the War Office discovered what was wrong. Friendly societies needed to find out what was wrong in that direction with regard to their organization. In the first place, the conditions of service were unfair; and, secondly, the pay was absolutely inadequate. They would probably say: "It is a question of supply and demand; if we can get doctors for what we offer them, why should not we have them?" But in that way they would stop the supply. The number of medical students was going down because the medical profession was not worth going into. If they asked any doctor quietly, and got the truth from him, he would tell them that he could not give the best work in contract work. He saw no reason why payment of the doctor should not bear a direct relationship to the work done. The National Deposit Friendly Society succeeded perfectly well. (A Voice: It is not a friendly society.) It was a society that ensured its members benefits in sickness, and provided for the paying of the doctor's bill. It was a very satisfactory society from the doctor's point of view, because it paid the doctor a regular fee for every case he attended. In conclusion, Dr. Gray hoped the friendly societies, in their own interests, would try to find some scheme by which their doctors would be paid according to the work done, and then the societies would get a great deal better work.

Mr. CRONIN (North London District Oddfellows) said he was anxious that friendly societies should come into conference with the doctors, and he was absolutely unaware that the trouble had arisen at all in the friendly societies' camp. He could quote from the evidence of a member of the Committee of Management of the Lodge of the Manchester Unity that in a recent sale of a practice the doctor who was intending to retire offered not only his private practice but his club practice to the incoming doctor. In that instance the club practice was considered of such value that the sum of £100 was kept back by the incoming doctor until he knew for certain that he was being appointed as club doctor. Mr. Cronin would be only too thankful if they could come into conference at a round table or at the national conference of friendly societies purely and simply for the purpose of satisfying their doctor friends. At present he was not conscious that any one of the friendly societies' men was complaining. He came to the meeting fully convinced that the doctors were the best friends of the friendly societies, and yet one of the most eminent representatives of the profession had said to them in that room, "You are not getting good service." He was repeating the very words that Sir Thomas Barlow made use of. He believed when he came

into that room that the friendly societies did get good service. He would like to remind the medical men present that every one of the lives for whom they contracted were selected lives, and if Dr. Pearse would analyse still further the figures he had quoted he would find that the pay in the experience of friendly societies in many thousands of instances did not involve medical attendance. The excessive sick pay in older years of life that friendly societies' men received meant the equivalent of an old age pension, and the doctor never came into touch with the patient. He could instance dozens of such cases. As to the vexed question of the man who rose in the world and wanted his pound of flesh, it was possible that the cases Dr. Pearse had instanced were absolutely correct, but his own personal experience was that he had paid for his doctor's attendance by contract for seventeen years past, and yet, during those years, every time that he needed a doctor he had gone to another medical man, because he happened to live near him, and had paid him his proper fee. Two other members of friendly societies sitting near him had done the same thing. In one of the branches represented there that afternoon out of 460 members 300 were outside the radius of the doctor's attendance. Those were statistics given him by the secretary of that particular branch in Wigmore Street. The doctor was paid all the time. Dr. Pearse had referred to some special cases. There were many working-class men and clerks living in the suburbs who still paid their medical fees to friendly societies located in the centre of London. He was going to suggest a plan which he hoped would be a perfectly satisfactory solution to both sides and which might form a basis for consideration at a conference which might be held. Would it not be well if the doctors were civil servants? [Voices: "No."] Surely his remarks were not to be met by an immediate "No." He had heard from two doctors there that day of things which ought not to occur. He had heard that men were not following the medical profession because the remuneration or rewards were not adequate for the work. He contended that they ought to be adequate. Then, again, Sir Thomas Barlow said he could give instances of doctors who were not only giving their services daily, but who actually put their hands into their pockets to save the life of their patients. That was a scandal. The remedy was not by putting pressure upon the men who were very poor. The skilled artisan had been referred to. In his own lodge he was proud to know men who, with a salary of 25s. a week, had to keep a wife and children and paid to the society 5s. a year, which was as much as they could give. If the pressure were put on so that the fees charged to these men were absolutely impossible the doctor would not benefit; the men must then go to the infirmary or the free hospital. The remedy was not to raise the fees. He suggested that the matter should be conferred upon between the National Conference of Friendly Societies and a representative body of doctors with a view to a demand for a State medical system. He ventured to say that when the doctors were civil servants they would certainly not be as badly off as 20 gentlemen that afternoon had said doctors were.

Mr. ALFRED CHAPMAN (South London District Ancient Order of Foresters) remarked that it was not by extreme assertions that any good outcome of the meeting would be attained. The National Conference of Friendly Societies, when it had the matter under consideration in conference with the medical men, had sternly to stand upon its dignity, and so they could not submit to a wage limit. The question of the pay that doctors received was a debatable question, and the cruel 3s. a year given in many places in agricultural districts was certainly not to be thought of. A friendly conference and the force of public opinion in friendly societies were very urgently necessary in order that the standard should be raised. In 1898, at a conference with friendly societies held in the Council Chamber of the General Medical Council, Sir William Turner, who presided, asked whether something could not be done to constitute a Conciliation Board between the friendly societies and medical men. The National Conference of Friendly Societies in 1899 passed a resolution agreeing to the principle of a conciliation board having for its object the mutual settlement of disputes between friendly societies and their branches and medical officers engaged by such

societies or branches, and that such Conciliation Board should comprise five representatives appointed by the General Medical Council. The secretary of the National Conference sent a copy of the resolutions to the General Secretary of the Medical Council, but there was no response. By and by they were summoned to a meeting of the British Medical Association, which occurred on February 3rd, 1901, and Dr. W. A. Elliston, President of the Association for the year, was in the chair. Five representatives of the friendly societies appointed for the Conciliation Board who attended were surprised to find that though three years had elapsed no step had been taken by the medical profession to appoint their quota. At that conference they still found the one great obstacle—the friendly societies would not consent to the wage limit. Since then the societies had not received information that the medical profession had appointed five men or accepted the principle of the Conciliation Board. As a friendly society leader he appealed to the medical men that the proposed Conciliation Board should be formed. Any of the questions in dispute could be dealt with by the board as representing the medical profession on the one side and the friendly societies on the other. It would create a public opinion which would in the end attain all the purposes that professional men had and all the purposes which the friendly societies hoped for.

Mr. SMITH WHITAKER (Medical Secretary, British Medical Association), referring to the conference held ten years ago, said he knew something of the reason why it had proved abortive. In the first place, there was a deadlock on a question of principle. On the one side the friendly societies said, "We cannot enter into any discussion on the subject of the wage limit." On the other side the medical profession said, "If you are not prepared to discuss the question of a wage limit, it is not worth while entering into conference." By a wage limit he did not mean an absolutely rigid limit that no person receiving more than certain wages should receive medical attendance. Another reason for the abortive result was that at the time it was felt that the medical profession was not sufficiently organized for any representatives of the profession to negotiate with the same authority with which friendly societies could negotiate. Within the last six or eight years matters had improved to some extent in the medical profession from that point of view. There were present that day representatives of the British Medical Association from all parts of Great Britain; representatives had been appointed from places as far north as Inverness, as far south as the Channel Islands. There were present no fewer than 100 gentlemen sent up by local Divisions of the British Medical Association. He was rather sorry that no representatives of the Association had had an earlier opportunity of taking part in the present discussion, because if there was any means by which the difficulties on both sides could be brought to a focus and adjusted, it must be by negotiation between responsible representatives of organized bodies who had a definite mandate to speak for those whom they represented. The British Medical Association included more than half of the profession in the United Kingdom, including a large proportion of the general practitioners, and spoke with a greater authority than any other body in the medical profession. Some of the speeches had contained contradictory assertions. Some of the representatives of the friendly societies had rather suggested that they had no grievances, and that the grievances were on the side of the doctors. Others had suggested that the societies had various grievances. One speaker suggested that sometimes certificates were given in a way they ought not to be. If that statement could be justified by fact then certainly there was a grievance and a ground of complaint, and the men who gave the certificates should be brought to justice. Let it be frankly admitted that there were grievances on both sides. There must be grievances in all human relations, and as reasonable men, their business was to find out the practical reasons for those grievances. The friendly societies and the medical profession did not commit acts of injustice from a desire to be unjust, but because they did not see that they were being unjust. Every man was right from his own point of view, and "if you want to come to terms with him you must get at his point of view and

he must get at your point of view, and then you can both try to find means to reconcile your opinions." It was really agreed that there were grievances on both sides, and the question was, How were these grievances going to be removed? The two grievances most spoken of that afternoon were the alleged inadequacy of remuneration and the question of wage limit. What medical men felt very strongly, and complained of, was that a form of contract between the medical practitioner and his patients, originally intended by the doctor for people of a particular class and accepted by him for reasons applicable only to that class, had been greatly extended, and was still being extended, to people of other classes. [Voices: "No."] He did not think they would arrive at any satisfactory result, there or elsewhere, by point-blank assertions on the one side "This is so," and on the other that "That is not so." The fact that had to be recognized was not whether the grievances were real, but whether a man felt there was a grievance; not whether doctors were really injured, but whether they felt they were injured. He spoke as an official of the British Medical Association who visited all parts of the United Kingdom, and he would tell them that the question of a wage limit had caused great irritation in the minds of medical men in all parts of the country. He was engaged for ten years in general practice, and the chief thing that caused friction and rupture at Great Yarmouth was the question of a wage limit. Club appointments were given up, and friendly societies organized institutes to carry on the work. He knew that the medical practitioners of that town were not willing to take up club practice again. They never realized until they gave up what slavery it was and how unremunerative it was. Some of them sacrificed club appointments bringing them in £300 a year. It was a question of the wage limit more than anything else—a question of medical men being called upon to attend people whom they ought not to attend on those terms. It was not entirely a question of people who had been originally working men. He himself attended the family of a gentleman who was a shareholder in a fairly successful business and never had been what was known as a working man. He was a member of a friendly society and he (Mr. Whitaker) had attended all the family excepting himself. One day he attended one of the family, who said her father was ill and "You know he is attended by his club doctor." The medical profession maintained that the bargain between them and the friendly societies was a free contract and that it was not unreasonable for the doctors to say what people they were willing to agree to attend under such a contract. In Great Yarmouth they were told by some Foresters that though they saw there was some reason in the contention of the medical profession they were bound by the rules of that Order. He submitted that any organization could change its rules if it thought proper, but if friendly societies framed their rules on such a basis that every member of a friendly society was entitled to claim the particular benefit of medical attendance under contract, he did not see much hope of an amicable adjustment between the two parties. The medical profession claimed freedom of contract, freedom to say who were the people they were willing to admit to those contracts: the questions of payment were questions of fact—actuarial questions. The question of the so-called wage limit was also a question of fact. The friendly societies asserted that this was an imaginary grievance, that the number of people who claimed attendance was very small, and was balanced by the number of people who paid to the Orders and did not claim medical attendance. The medical profession did not want them to pay for attendance that they did not get. The thing should be dealt with on plain business lines. Let them advise their doctors that no member of their societies should be called upon to pay for medical attendance which was not given. On the other hand, those who should have such attendance should pay for it. Medical men did not want any charity, they did not want any pay for work that was not done by them. He held that if the friendly societies were prepared to meet the medical profession in conference they must be prepared to discuss everything. At the present time in this country a medical practitioner was more or less a free agent; he was not compelled to attend people who asked him to attend them. A previous speaker

had suggested that medicine should become a State service; but that matter could not be settled by doctors and friendly societies in conference. Other people would have to be consulted. Let the discussion be kept to matters within their own power. There was the question whether the medical profession was not at present being depleted. Years ago a man who had scientific tastes and wanted a professional life would be likely to go in for medical work. But with the great development of science men of that type had now many more lucrative employments to choose from. Electricity and chemistry and engineering were drawing those men who would otherwise have gone into medical work. Under these circumstances it seemed doubtful whether a sufficient supply of medical men to serve the country satisfactorily would be maintained. He had met in conference not long since representatives of a very large workmen's organization, one of the most influential trades unions. They had met to discuss the conditions of medical service, and they said it was becoming a very serious question for them, because they found that in some districts the medical profession were getting so discontented that men of good standing could not be obtained to take up the work. The friendly societies were dependent to a certain extent on the services of their medical officer; if they found that they were getting under existing conditions men whom they could thoroughly rely upon, that they and their members were getting perfectly satisfactory service, then, perhaps, there was no particular reason why they should have a conference at all, and the medical profession must make the best of it. But if there was any lurking doubt as to whether the position was altogether satisfactory, as to whether things had really improved with them—because it was not only the present position but the tendency that they should look at—if they had any doubt in their minds as to whether things were really going well with them as regards medical attendance, was not it better to come to a reasonable understanding with members of the medical profession and consider not only those grievances which they were quite ready to admit but those grievances which might appear to them a little unreasonable?

Dr. McManus (Direct Representative, General Medical Council) proposed a resolution of "cordial thanks to the Charity Organization Society for convening the conference, trusting that it might have valuable results in leading to an amicable adjustment of existing difficulties through negotiation between bodies representative of the friendly societies and of the medical profession." He had been twenty-three years a medical officer in connexion with the Oddfellows, Hearts of Oak, and Foresters, and he was fond of the work and fond of the men. Some of the best friends he had in the world were British working men. He was delighted to hear Mr. Mofrey say that the working man was too honourable to take advantage of his club doctor. Would he preach the same gospel to some of his friends? Dr. McManus had to do with some working men who were in a far better position than himself, but were mean enough to come to him and take full advantage of his services. He had one who paid £5 5s. for a consultant and paid him (the speaker) less than a penny a week for his services. Those people did not say, "We are in a position to pay you a living wage for your services." He could deal with a working man but not the working man's wife. When he was a young practitioner in Battersea some old women came to him and asked him to take them in a club. He did so, and they had about £5 worth of medicine in the first quarter, and at the end of the quarter he had nothing. Medical men should think twice before they took women's clubs. The question of many men paying the doctor and at the same time living outside the district had been referred to. There might be a few cases, but it was not fair to quote them. He had done any amount of club work, and the secretaries always gave him a list of the men affiliated with their clubs, and he attended them. If a working man living in the suburbs paid for medical attendance to a friendly society when he worked in London, he did not pay for medical attendance twice over. He (Dr. McManus) did not give the British working man credit for doing that, because the difficulty was met by the scheme of affiliation. The power of summary dismissal without appeal was one of the grievances from which medical men suffered.

Mr. JOLLY (Ancient Order of Foresters) seconded the resolution.

Dr. PEARSE, when called upon to reply, said his object had been sufficiently served if he had ventilated the matter. One point was that the contract society work destroyed the medical man's interest in his work. That he repeated, and it was one reason why he had given up contract work, and he knew that many other medical men had done the same.

The resolution was then put to the meeting and carried unanimously.

The CHAIRMAN said he was quite certain he was warranted in their name in offering their very sincere thanks to Dr. Pearse for coming up to London and giving them the very admirable and temperate speech in which he had opened the discussion that afternoon.

A vote of thanks to the Chairman concluded the meeting.

Association Intelligence.

PROCEEDINGS OF COUNCIL.

At a Meeting of the Council, held at 429, Strand, London, W.C., on Wednesday, January 27th, 1909, at 2 o'clock in the afternoon:

Present:

Mr. EDMUND OWEN, LL.D., London, Chairman of Council, in the Chair; afterwards Dr. EDWIN RAYNER, Stockport, Treasurer.

Sir WILLIAM WHITLA, M.D., Belfast, President-elect.

Dr. HENRY DAVY, Exeter, Past-President.

Dr. J. A. MACDONALD, Taunton, Chairman of Representative Meetings.

Dr. JOHN FORD ANDERSON, London
Dr. JAMES GRANT ANDREW, Glasgow
Mr. H. A. BALLANCE, M.S., Norwich
Fleet Surgeon E. J. BIDEN, R.N., Fareham
Dr. T. R. BRADSHAW, Liverpool
Surgeon-General W. R. BROWNE, C.I.E., M.D. (Ceylon, and South Indian and Madras Branches)
Dr. R. COCHRANE BUIST, Dundee
Mr. ANDREW CLARK, D.Sc., London
Dr. FRANCIS CLARK, London (Hong Kong Branch)
Dr. ASTLEY V. CLARKE, Leicester
Dr. E. CURETON, Shrewsbury
Mr. C. F. CUTHBERT, Gloucester
Mr. E. J. DOMVILLE, Exeter
Mr. A. J. DREW, Oxford
Mr. G. YOUNG EALES, Torquay
Mr. J. H. EWART, Eastbourne
Mr. C. E. S. FLEMING, Bradford-on-Avon
Mr. P. W. H. GARSTANG, Altrincham
Dr. T. D. GREENLEES, London (Cape of Good Hope Eastern, Western, and Border Branches)
Dr. G. E. HASLIP, London
Dr. HENRY HETLEY, London
Dr. H. MCKENZIE JOHNSTON, Edinburgh
Mr. HUGER R. KER, London
Mr. R. H. KINSEY, Bedford
Mr. F. C. LARKIN, Liverpool
Dr. A. E. LARKIN, Buckingham

Dr. CHARLES MACFIE, Bolton
Dr. DONALD J. MACKINTOSH, M.V.O., Glasgow
Dr. C. J. MARTIN, F.R.S., London (Sydney and New South Wales Branch)
Dr. J. MUXRO MOIR, Inverness
Dr. C. G. D. MORIER, London (South Australian and West Australian Branches)
Professor J. T. J. MORRISON, Birmingham
Dr. T. G. NASMYTH, Edinburgh
Dr. B. H. NICHOLSON, Colchester
Dr. FRANK M. POPE, Leicester
Dr. T. WHITEHEAD REID, Canterbury
Dr. H. JONES ROBERTS, Penryn
Dr. ERIC E. SHAW, Belfast
Dr. LAULISTON E. SHAW, London
Dr. W. JOHNSON SMYTH, Bournemouth
Mr. CHARLES R. STRATON, Salisbury
Mr. JOHN LYNN THOMAS, C.B., Cardiff
Dr. G. J. CRAWFORD THOMSON, London
Dr. ALEXANDER TROTTER, Perth
Dr. G. E. TWYMAN, London (Sydney and New South Wales Branch)
Mr. T. JERNER VERRALL, Brighton
Dr. SINCLAIR WHITE, Sheffield
Lieutenant Colonel E. M. WILSON, C.B., C.M.G., Farnborough

Minutes.

Subject to the insertion of a certain amplification requested by Professor Morrison, the Minutes were signed as correct.

Return of Council to the Strand.
The CHAIRMAN congratulated the Association on being again under its own roof.

Apologies.

Read letters of apology for non-attendance from the President, Sir James Barr, Mr. J. Ward Cousins, Dr. George Edmond, Dr. D. Goyder, Dr. Wm. Hall, Colonel Joubert de la Ferté, I.M.S., Major O. L. Robinson, Mr. W. St. A. St. John, Lieutenant-Colonel Simpson, C.M.G., Dr. A. T. Wear, Mr. F. E. Apthorpe Webb, Professor A. H. White, and Mr. D. J. Williams.

Deaths.

The CHAIRMAN reported the death of Dr. W. A. Elliston, President of the Association at the Ipswich Meeting in 1900, and that Dr. B. H. Nicholson had represented the Council at the funeral. The Chairman also reported the death of Mr. George Eastes, a former Member of the Council, and stated that he had attended the funeral on behalf of the Council, and the following Resolutions were passed, all present rising in their seats:

That the Council learns with sincere regret of the death of Dr. W. A. Elliston, President of the Association in 1900, and for many years a Representative of the East Anglian Branch on the Council and Committee of Council, and requests the Chairman to convey to Mrs. Elliston and family an expression of the Council's warmest sympathy.

That the Council learns with sincere regret of the death of Mr. George Eastes, for many years a Member of the Council, and Representative of the Metropolitan Counties Branch, and requests the Chairman to convey to Mrs. Eastes and family an expression of the Council's warmest sympathy.

Application for Charter.

The CHAIRMAN OF COUNCIL and the CHAIRMAN OF THE ORGANIZATION COMMITTEE jointly reported that they had, as instructed by the Council on October 28th (Minute 340), carried out the necessary arrangements for the presentation; on behalf of the Association, of a Petition to His Majesty the King to grant to the Association a Royal Charter of Incorporation in the form approved by the Council, and that they duly presented the Petition on December 21st last.

The action was approved.

Portraits.

The CHAIRMAN reported receipt of three portraits from Mr. Herbert Sieveking, M.R.C.S., L.R.C.P.:—Sir William Lawrence, a former President of the Royal College of Surgeons; Sir Edward Sieveking, Physician-in-Ordinary to the late Queen Victoria; and Sir Astley Cooper; and the best thanks of the Council were accorded to Mr. Sieveking for his gift.

Medical Library Association.

Read the following Communication:

University College, Bristol,
January 14th, 1909.

Dear Sir,

On January 9th at a meeting at Leeds it was decided to form a Medical Library Association, and a provisional Committee was appointed to draw up a Constitution and rules. It was suggested that we should approach the British Medical Association with a view to obtaining their permission to hold the next meeting of the Association during the time of the Annual Meeting of the British Medical Association at Belfast. Will you kindly put the matter before your Council? If they would be willing to grant such a course, it would be a great convenience if the Local Committee could provide us with a room in which we could make an exhibition of books, etc., connected with library conduct and work.

Believe me to be, dear Sir,

Yours faithfully,
I. WALKER HALL.

The Secretary.

British Medical Association, London.

Professor W. Osler has been elected President, and the chief librarians of the Country are on the Provisional Committee.

It was decided that the request of the Medical Library Association be granted, provided the local Executive at Belfast can find the necessary accommodation. Further, that, subject to the approval of the Medical Library Association, the Science Committee be requested to nominate a Representative on the Provisional Committee.

Memorandum by the General Secretary and Manager on the Proposed Variation in the Terms of his Appointment.

The following Memorandum, in reference to Minute 288, That the office of General Secretary and Manager be known as Financial Secretary as from January 1st, 1909,

Having been circulated to the Council, was considered:

On the conclusion of that Meeting, the General Secretary and Manager wrote to the Chairman of Council, and ventured to point out that in making such a radical change in his title he might have been afforded an opportunity for stating his views on the subject.

The General Secretary and Manager respectfully submits:

(1) That the change, if persisted in, is capable of being, and will be, interpreted as a reflection on the manner in which he has discharged the duties of his office.

(2) That there is no record to show that the views of any past or present Chairman of Council or Treasurer with special practical experience of the duties of the office were given in the matter.

(3) That it is essential for the proper conduct of the business of a large commercial undertaking such as the BRITISH MEDICAL JOURNAL that there should be an officially recognized Manager.

(4) That the practice of having a General Secretary and Manager to the advantage of the Association, as is evidenced by the following facts:

The balance of Assets over Liabilities has been increased during the service of the present General Secretary and Manager by £18,000.

The Foods and Drugs Exhibition during four years has shown a profit of £4,400, and as a result the financial burden of an Annual Meeting has been materially lightened, a striking contrast to the years when the Drugs Exhibition was not managed by your General Secretary and Manager.

The paper bill of the JOURNAL represents an expenditure of about £9,000 per annum. In 1905, the first complete year of office of your present General Secretary and Manager, this was reduced by £1,200, a saving not confined to that year, but one that has been perpetuated and correspondingly increased year by year as the bill of the JOURNAL and SUPPLEMENT has grown and membership of the Association expanded. The following table illustrates the growth of expenditure on paper for the production of the JOURNAL for three equal periods:

			Increase.	Decrease.
1890-1895	£1,237	—
1896-1901	£1,798	—
1902-1907	—	£350

Thus it will be seen that in 1907 on a like ratio there should have been a further substantial increase. As is shown above, the paper bill was less by £350 than in 1902, notwithstanding that in 1907 the Association published 200 more pages of literary matter, and 100,000 more copies of the JOURNAL.

When it is reflected that the 1906 surplus was only £1,385, and the 1907 £1,319, the importance of the above economies cannot be underestimated.

In 1905 it was recognized as essential for the continued prosperity of the Association that the form of producing the JOURNAL called for considerable improvement. On going into the matter, it became evident that to carry out the improvements desired, an increased annual expenditure of some £5,000 would be involved. Such an outlay was beyond the financial resources of the Association. The General Secretary and Manager submitted a scheme, which was adopted, whereby the desired improvements were effected without any additional burden to the Association. Under the scheme the number of advertisement pages are materially reduced, yet the revenue from such source in 1908 is more by £2,000 than the revenue in 1902.

Between 1902 and 1907 the annual general expenditure of the Association has increased by £7,000, and but for the practical economies of your General Secretary and Manager a serious financial position must have arisen.

In conclusion, the General Secretary has no desire to attempt to dictate to the Council, but he respectfully submits that it is difficult to appreciate that the change in his status and title will assure better administration, or greater prosperity to the Association.

The General Secretary and Manager trusts that the Council will see its way to reconsider the question.

GUY ELLISTON.

429, Strand,
January 16th, 1909.

Moved by the CHAIRMAN OF REPRESENTATIVE MEETINGS, seconded by Mr. KINSEY:

That the Council proceed to the next business.

The Motion having been put from the Chair, the same was declared to be lost.

Moved by the CHAIRMAN OF REPRESENTATIVE MEETINGS, seconded by Mr. KINSEY:

That this matter be not discussed, as the Resolution referring to the alteration in the title of the General Secretary having been passed by the Representative Meeting, is binding on the Association.

Whereupon an Amendment was moved by Professor MORRISON, seconded by Dr. JOHNSON SMYTH:

That, owing to special information received by the Council since the date of its previous Meeting, the Council thinks it unwise to carry out the instruction of the Representative Meeting to change the title of the General Secretary and Manager to that of Financial Secretary, and the Council resolves to report this fact and the reasons therefor to the Divisions.

This having been put from the Chair was declared to be carried—23-19.

The CHAIRMAN on putting the Amendment as a Substantive Motion, it was

Moved by Mr. VERRALL, seconded by Dr. POPE:

That the Council decides to bring before the next Representative Meeting a Resolution adding to the title of the Financial Secretary the words "and Manager of the JOURNAL," and directs the Journal and Finance Committee to report to the Council on the subject.

The Amendment of Mr. Verrall was then put from the Chair and declared to be carried.

On this being put as a Substantive Resolution,

An Amendment was moved by Professor MORRISON, seconded by Dr. ASTLEY CLARKE, and carried:

That the words "of the JOURNAL," be omitted.

After considerable discussion it was decided to insert the word "Business" before the word "Manager."

Finally, Mr. VERRALL having accepted the emendation "Financial Secretary and Business Manager," the Amendment was agreed to, and carried as follows:

That the Council decides to bring before the next Representative Meeting a Resolution adding to the title of the Financial Secretary the words "and Business Manager," and directs the Journal and Finance Committee to report to the Council on the subject.

It was then put and carried as a Substantive Resolution.

Journal and Finance Committee.

The Treasurer presented the Minutes of the Journal and Finance Committee of January 20th, 1909.

The action of the Editor in refraining from publishing in the JOURNAL a report of a certain case tried before the General Medical Council at its November Session was approved. And it was further agreed that, if in the opinion of the Editor it is undesirable to publish an account of any case before the General Medical Council, he should report the facts to the Journal and Finance Committee.

The accounts for the Quarter ending December 31st last, amounting to £12,444 9s. 4d., were received and approved, and the Treasurer was empowered to pay those remaining unpaid, amounting to £3,299 17s. 4d.

The remainder of the Report was approved.

Medico-Political Committee.

Dr. MACDONALD presented the Report of the Medico-Political Committee of December 2nd, 1908, and January 6th, 1909.

It was decided that representations be made to the Board of Education on the desirability of provision being made in the Education Code that school medical officers and their assistants should be appointed without reference to time, subject to reasonable notice, and should not be liable to dismissal without right of appeal to the Board of Education.

Six Members were authorized to attend, as Representatives of the Association, the Conference, convened by the Charity Organization Society, on "Friendly Societies and the Medical Profession." It was decided that their railway fares be paid by the Association, and that it be referred to the Chairman of Council and the Chairman of the Medico-Political Committee to nominate such members.

In view of the appointment of a Departmental Committee of the Home Office to deal with questions of Coroners' Law, evidence upon the various matters included within the scope of its reference is to be submitted by the Association. The Medico-Political Committee was authorized to prepare and submit such evidence on behalf of the Association. For the present the contemplated representations to the Lord Chancellor are abandoned; and the Lord Chancellor will be informed accordingly.

Professor MORRISON inquired who would submit the

proposed evidence, and whether the Council would have an opportunity of seeing a *précis* of the same.

The CHAIRMAN of the MEDICO-POLITICAL COMMITTEE replied that the Committee would select one or two Representatives to meet the Departmental Committee, but that the *précis* could not be previously submitted to the Council, as the Departmental Committee would meet before the April Meeting of the Council.

Having regard to the number of other Parliamentary matters requiring the attention of the Association, and the improbability of effecting the Amendments desired to the Notification of Births Act at an early date, action with respect to the matter is postponed, and the Annual Representative Meeting will be notified accordingly.

In view of the appointment by the Privy Council of a Departmental Committee to consider the Amendment of the Midwives Act, the Medico-Political Committee were authorized to prepare and submit evidence on behalf of the Association to the Departmental Committee in accordance with the general tenor of the previous decisions of the Association on the subject, and to urge the advisability of representation of the Association on the Midwives Board.

The remainder of the Report was approved.

Science Committee.

Dr. MARTIN presented the Report of the Science Committee of December 19th, 1908.

The Council expressed its approval of the principle of the conversion, as far as possible, of the Library of the Association into a Lending Library, so as to be readily available for the provincial Members of the Association, and instructed the Science Committee to collect all necessary information, and submit definite Recommendations.

As a first step towards the conversion of the Library into a Lending Library, it was decided that the Recommendations contained in the Report of the Science Committee on the formation of a special Research Lending Library, which was approved by the Council in March, 1906, be put into execution by the formation of collection of monographs and periodicals to be lent, under the conditions approved by the Council, to Members engaged in special researches.

It was resolved that Divisions and Branches be informed that the Council, when fixing the amount of ordinary capitation grants to Branches, will take into consideration the expenses of the scientific work of Divisions and Branches, and will also be prepared to make supplementary grants for such purposes when desirable.

The Council, being satisfied that it would be advantageous, both as giving a more definite purpose to the scientific discussions in Division Meetings, and as tending to create greater interest amongst Members generally in the work of the Sections at the Annual Meeting, if the Sections and the Divisions could be brought into cooperation, resolved:

(i) That the Programmes of forthcoming discussions in the Sections of the Annual Meeting be furnished at the earliest possible date to Honorary Secretaries of Divisions, and that it be suggested that they select from such Programmes those subjects which are, in their opinion, suitable for preliminary discussion by their Divisions.

(ii) That the officers of each Section be asked to report as to any subjects contained in the Programmes of their respective Sections, of which, in their opinion, the consideration by the Divisions, prior to the Annual Meeting, would be especially useful.

(iii) That the Divisions be invited to suggest, through the Central Science Committee, subjects for consideration by Sections at the Annual Meeting.

The remainder of the Report was approved.

Organization Committee.

Mr. ANDREW CLARK presented the Report of the Organization Committee of December 8th, 1908, and January 12th, 1909.

It was resolved that it be a Standing Order to the Organization Committee to appoint at its first Meeting for each year a Standing Subcommittee for the purpose of supervising the analysis of Branch and Division Reports,

such Subcommittee to consist of the Chairman of the Committee and the Treasurer, *ex officio*, and of three other Members of the Committee.

The consideration of the Grants to be made to Branches for the year 1909 was deferred until the April Meeting of the Council. Pending the decision of this matter by the Council, the Treasurer is authorized to make to Branches, which are in need of funds, such grants as he thinks necessary, at a rate not exceeding 1s. per Member, of such Branch applying.

Dr. POPE asked if the foregoing Resolution would override By-law 16, which provides that "the Treasurer of the Association shall annually pay . . . to each Branch such sum not exceeding 4s. . . for each Member of the said Branch, etc."

The CHAIRMAN replied in the negative.

The Council approved the amended Rules submitted by the Cape of Good Hope (Western Province) Branch.

The Organization Committee was authorized to approve Rules of Divisions and Branches which are in accordance with Rules already approved by the Council.

On the suggestion of Mr. DOMVILLE, it was agreed that those Divisions and Branches which have not yet adopted Rules should be requested to do so.

The Colonial Branches are grouped for representation on the Council for the year 1909-10 in the same manner as for the year 1908-9, subject to the inclusion of the new Assam Branch in the Northern Indian Group.

For the year 1909-10 each Division not in the United Kingdom which has an Honorary Secretary and the necessary organization is granted independent representation in the Representative Meeting.

The Council report to the Representative Meeting that the question of a scheme of probable dates for issues of Reports to Divisions is being referred to the Annual Conference of Secretaries for consideration before any recommendations are made.

In reference to Minute 108 of the Organization Committee of January 12th, 1909,

108. Resolved: That a communication be addressed to the Honorary Secretaries of all Divisions and Branches, enclosing, for their information, a copy of Counsel's Opinion, and that the Editor be requested to publish at the earliest possible date the full Statement of Case and Counsel's Opinion,

Dr. MCKENZIE JOHNSTON asked what the Organization Committee proposed to do with Counsel's Opinion.

The CHAIRMAN of the ORGANIZATION COMMITTEE replied that the Committee were of opinion that the whole of the Association should be acquainted with the Opinion of Counsel. In response to a further question—

The CHAIRMAN of COUNCIL gave an assurance that nothing would be done as to Counsel's opinion except by the instruction of the Council.

The remainder of the Report was approved.

Ophthalmia Neonatorum.

Dr. BURST presented the Report of the Ophthalmia Neonatorum Committee of December 19th, 1908, which was received and approved.

Public Health Committee.

Mr. DOMVILLE presented the Report of the Public Health Committee of January 5th, 1909, which was received and approved.

Hospitals Committee.

Dr. POPE presented the Report of the Hospitals Committee of January 7th, 1909.

It was decided that a further communication be addressed to the Medical Committee of King's College Hospital in the terms of a letter [as amended] submitted to the Council by the Chairman of the Hospitals Committee and Dr. Lauriston E. Shaw on behalf of the Committee.

The Council adopted a Report submitted by the Hospitals Committee as its Report to the Representative Meeting, presented in accordance with the instructions contained in Minutes 71a and 96 of the Annual Representative Meeting, 1908.

In response to the instruction contained in Minute 129 of the Annual Representative Meeting, 1908, the following

definition of a "Nursing Home" is submitted by the Council for the consideration of the Representative Meeting :

"A 'Nursing Home' is an institution in which patients are received for medical care under the attendance of Medical Practitioners selected by themselves, and where the patients are responsible to the home for the charges for maintenance and nursing, and to the Medical Practitioners for their fees."

The Memorandum submitted by the Hospitals Committee will be issued for the consideration of the Divisions, in accordance with Minute 150 of the Annual Representative Meeting, 1908.

Resolved: That the remainder of the Report be approved.

The Chairman.

On the CHAIRMAN expressing the intention then to vacate the Chair, the Treasurer took his place.

Central Ethical Committee.

Mr. KINSEY presented the Quarterly Report of the Ethical Committee, December 15th, 1908, and January 8th, 1909, which was received and approved. Mr. Kinsey also presented the Special Report of the Ethical Committee upon the questions raised in the communication from the Metropolitan Counties Branch, consideration of which was postponed from the last meeting of the Council. The Report was approved and the Recommendation of the Committee adopted.

Irish Committee.

Dr. Cecil Shaw (in the absence of the Chairman) presented the Report of the Irish Committee of January 9th, 1909, which was received and approved.

Premises Committee.

Mr. Andrew Clark presented the Report of the Premises Committee of January 15th, 1909, which was received and approved.

Candidates.

Seven candidates whose names appeared on the Notice convening the Meeting were elected Members of the British Medical Association.

National Temperance League.

The Chairman reported receipt of communication from the Secretary of the League asking for permission to include the announcement of their Annual Breakfast in the Programme of the Annual Meeting, which was granted.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH.—The winter clinical meeting of the Edinburgh Branch will be held in the Royal Infirmary, Edinburgh, on Friday, February 26th, at 4 p.m. The members of the other Scottish Branches are invited to attend the meeting. The museum will be open at 11 a.m., and special clinics will be held during the forenoon. Dinner in the Royal British Hotel, Princes Street, at 6.30 p.m.; morning dress; dinner ticket, 5s.—A. LOGAN TURNER, FRANCIS D. BOYD, Honorary Secretaries.

GLOUCESTERSHIRE BRANCH.—A general meeting of this Branch will be held at the Stroud Hospital on Thursday, February 18th, at 6.30 p.m. Agenda: (1) Minutes of last meeting. (2) Chronic diarrhoea, its varieties and treatment.—Dr. Robert Hutchison, London. (3) Cases of interest. The Secretary will be pleased to hear from any member who will show cases or pathological specimens at future meetings during this session. There will be a supper afterwards at the Subscription Rooms (tickets 4s. each, exclusive of wine).—D. E. FINLAY, Honorary Secretary, Gloucester.

LANCASHIRE AND CHESHIRE BRANCH: ALTRINCHAM DIVISION.—A general meeting of the Division will be held at 5 p.m. on Wednesday, February 17th, at the Brooklands Hotel. The meeting will be a special meeting under Rule 14, for the purpose of amending Rule 8 (election of Representative), and of considering the adoption of new rules (namely, "Bradford" Rule, and Rule 2), copies of which have been sent by post to each member. In the ordinary meeting Dr. Rhodes will read a paper, and the usual general business will be taken.—T. W. H. GARSTANG, Honorary Secretary.

LANCASHIRE AND CHESHIRE BRANCH: LEIGH DIVISION.—A meeting of this Division will be held on Thursday, February 18th, at the Co-operative Rooms, Ellesmere Street, at 8.30 p.m. Agenda: (1) Minutes. (2) The following motions will be considered: (a) With respect to the earlier election of Representative. (b) That Rule 27 in Model Rules adopted be altered from 'not more than three months' to 'not more than nine months.' (c) That this Division considers that no new sick club should be formed in the Division. (3) The treatment of post-partum haemorrhage. (4) Correspondence. (5) Any other matters.—G. H. SHAW, Honorary Secretary.

LANCASHIRE AND CHESHIRE BRANCH: ST. HELENS DIVISION.—A meeting of this Division will be held on Wednesday, February 17th, at Piece Hotel, St. Helens, at 8.45 p.m. Agenda: (1) Minutes of last meeting and of the executive meeting. (2) Proposed ethical rules for the Division (copies of which will be forwarded to members). (3) References from the Standing Committees of the Association re hospitals, Charter, and medical officers of health.—JOHN J. ETCHEAN, Honorary Secretary.

LEINSTER BRANCH.—The annual general meeting will be held on Saturday, February 13th, in the Royal College of Physicians, Kildare Street, Dublin, at 4.30 p.m. The annual dinner will be held in the College Hall at 7.30 p.m. of the same day.—ARTHUR H. WHITE, Honorary Secretary.

MIDLAND BRANCH: LEICESTER AND RUTLAND DIVISION.—A special meeting of this Division will be held at the Leicester Infirmary on Wednesday, February 24th, at 4.15 p.m. Agenda: Discussion of certain questions relating to medical inspection of school children.—WILFRED E. GIBBONS, Honorary Secretary, Leicester.

SOUTH EASTERN BRANCH: CHICHESTER AND WORthing DIVISION.—A meeting of this Division will be held at the Infirmary, Chichester, on Thursday, February 18th, at 3 p.m. Mr. W. S. Simpson will take the chair. Agenda: (1) To discuss the working of the Inspection of Children's Bill in West Sussex. (2) To consider what steps should be taken with regard to the Registration of Births Act. (3) To consider a report from the Public Health Committee as to the desirability of health officers giving their whole time to the work. (4) To consider a resolution from the Brighton Division with regard to dividing the Branch.—H. C. L. MORRIS, Honorary Secretary.

SOUTH-EASTERN BRANCH: FOLKESTONE DIVISION.—A meeting of the Folkestone Division will be held at the Hotel Wampach, Folkestone, on Saturday, February 13th, at 8.15 p.m. Agenda: (1) The Division is requested to express its opinion for or against the following proposition: "That medical officers of health should be debarred from engaging in private practice"; and to add any qualifications, comments, or additional suggestions bearing on the matter which it may desire. (2) Medical inspection of school children (system of payment). (3) A letter from the Secretary of the Branch re police fees. (4) As to the advisability of dividing the South-Eastern Branch. All members of the South-Eastern Branch are invited to attend and introduce professional friends.—P. VERNON DODD, Honorary Secretary, Folkestone.

STAFFORDSHIRE BRANCH.—The second general meeting of the session will be held at the North-Western Hotel, Stafford, on Thursday, February 25th. The President, Dr. S. King Alocok, will take the chair at 5.15 p.m. Business: (1) Minutes of the last ordinary general meeting. (2) Correspondence. (3) Exhibition of living cases. (4) Paper: Mr. A. B. Cridland, Internal Squint in Children. (5) Paper: Mr. J. T. Hartill, Short Notes on a Rare and Interesting Case of Retention of Meneses, and Operations for and Relief of the Symptoms. (6) Exhibition of pathological specimens, etc. Dinner 7.15 p.m., charge 5s.—G. PETEGRAVE JOHNSON, Honorary General Secretary, Stoke-on-Trent.

YORKSHIRE BRANCH: BRADFORD DIVISION.—The adjourned ordinary meeting of the Bradford Division will be held at the Great Northern Victoria Hotel, Bradford, on Wednesday, February 17th, at 8.30 p.m. Agenda: (1) The report of the sub-committee on the Workmen's Compensation Bill, with correspondence sent to the meeting. (2) The report of the Medico-Political Committee on the medical inspection of school children will be discussed.—J. BEATTIE DENLOP and J. WHERRY WILSON, Honorary Secretaries.

MEMBERS ELECTED DURING THE DECEMBER QUARTER.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

GLOUCESTERSHIRE BRANCH.

A GENERAL meeting of the Branch was held at the General Hospital, Cheltenham, on Thursday, January 21st. The President was in the chair and 18 members present.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Pneumococcal Infection.—Dr. A. F. R. CONDER read notes on a case of pneumococcal infection, which was discussed by the President and Dr. COLLINS, and Dr. CONDER replied.

Rheumatoid Arthritis.

Dr. E. A. DENT read a paper on rheumatoid arthritis, its clinical aspects, diagnosis and treatment, illustrated by photographs. He said rheumatoid arthritis was really a name given to a number of conditions the cause of which was unknown. Owing to want of *post-mortem* investigation great confusion existed as to its pathology and causes. It was thought now that in many cases rheumatoid arthritis was an infective disease due to micro-organisms dwelling in the joints or elsewhere and elaborating toxins which caused an inflammatory condition. Possibly some cases were of nervous origin. The disease was best classified into (1) polyarticular rheumatoid arthritis which might be (a) acute, (b) subacute, (c) chronic, and (2) localized monarticular or senile rheumatoid arthritis. The acute type usually occurred in children or young adults and often commenced with pain and swelling of the small joints, especially the metacarpophalangeal joints of the index and middle fingers, spreading from these to others—pain often persistent and increased at night, swelling often fusiform. It might follow acute rheumatism.

The symptoms of the subacute form were similar to those of the acute in a modified form. This might be followed by the chronic variety, but usually this commenced slowly, attacking first one joint and then another; it might commence with numbness and tingling in the limbs, stiff neck, pain in the back, and neuralgic pain in the forearms and thigh. Often the onset was first noticed by either pain or swelling, or both, in the joints of the fingers, sometimes it commenced in a larger joint; this was more common in males than in females. The chronic form usually occurred between the ages of 20 and 50, and was much more common in females than in males; it often began at the climacteric, owing, it was supposed, to uterine disturbances such as haemorrhages, and, to a less degree, purulent or mucopurulent discharges. The author had often known the attack dated from a confinement. Influenza, prolonged mental anxiety and worry, hard manual labour with improper nourishment, were also predisposing causes, and he thought phthisis was a definite predisposing constitutional cause. The onset was often insidious; premonitory symptoms might occur such as numbness, pins and needles, etc.; with them, perhaps, stiffness of the joints and some enlargement. As a rule, the pain was worse at night; it was gnawing or burning in character; there was also loss of appetite, deafness, and coldness of the extremities. In advanced cases, the face, pale and wasted, with a sunken appearance around the eyes, was almost characteristic; the joints became twisted and distorted, so much, sometimes, that the patient was a helpless cripple. The interphalangeal joints were again those frequently attacked with fusiform swelling, the fingers might be dislocated, and generally there was ulnar deviation; there was wasting of the muscles, particularly the interossei. There was no joint which the disease never attacked. Sometimes ankylosis occurred; this was almost always fibrous, sometimes the spine was so much affected as to produce rigidity.

Circulatory System.—It was doubtful whether endocarditis and pericarditis occurred in uncomplicated rheumatoid arthritis; the heart was often accelerated. The toxins affected the nervous system, giving rise to pain,

numbness, and other symptoms. Pigmentation occurred in the skin; the diagnostic importance of this was, in the author's opinion, overstated. It occurred as freckles and streaks of brownish discoloration. The digestive system was frequently affected, and dyspepsia might be an exciting cause of the disease. The teeth should always be attended to. Anaemia was a marked feature of the disease, and was often not very amenable to treatment. The lymphatic glands sometimes became enlarged, but not the spleen.

Monarticular.—This occurred late in life, and was a pure degeneration. It contrasted much with the other variety in affecting the large joints, and it did not spread like the polyarticular type. Sometimes it was caused by an injury.

Diagnosis.—This disease might be mistaken for rheumatism, gout, or sciatica. In the early slowly progressive and chronic cases, also in subacute attacks, it was often difficult to diagnose from rheumatism. (1) In the chronic form of rheumatoid arthritis the small joints were attacked first, especially the proximal phalangeal joints of the first and second fingers. There was fusiform swelling. The affection was symmetrical. The disease prevailed in women. There was affection of the temporo-maxillary joint and cervical spine, pain along the clavicle, crepitation or grating on movement, clamminess of extremities. There was a tendency to spread from small to large joints. Often there was a family history of phthisis. (2) In the subacute form the small joints were attacked first; the swelling was circumscribed. The temperature was not very high. There was no acrid perspiration, very little (if any) tendency to endocarditis and pericarditis.

The following points distinguished rheumatoid arthritis from acute gout: The attacks of acute gout commenced suddenly by pain; usually there was swelling with redness and shininess of the big toes. It was rare in women.

From chronic gout it might be very difficult to distinguish. The history threw light. In gout definite attacks occurred from time to time, and usually there were deposits of urate of soda in the ears, hands, etc., more common in men, and there was no tendency to emaciation.

The features differentiating rheumatoid arthritis from sciatica, when the hip-joint alone was affected, were that the pain was in the joint. Usually the affected leg could not be crossed over the other without causing great pain. There might be thickening around the joint and grating might be felt on rotation.

Treatment.—Much could be done in the early stages to arrest and in more advanced to relieve. The disease attacked a constitution which had been debilitated from some cause; therefore lowering treatment must be avoided. In acute and subacute cases the patient must be in bed. Pain might be relieved by local applications of heat or soothing lotions. The joints must be kept at rest till the acute symptoms subsided; then at once gentle movement should be commenced to prevent stiffness. Carbolic compresses; guaiacol and iodine in proportion of 1 to 6 might be painted on. In chronic cases blisters were most useful, especially in the temporo-maxillary joint, and should be small and repeated. Mustard leaves, bathing with hot water, were useful; sometimes rubbing with liniments did good. When the joints were weak and there were soft swellings, adhesive strapping should be applied. Sometimes extension with weights was soothing and helped to counteract the tendency to flexion. Fingers which were becoming flexed could be treated with a splint put on at night and taken off in the morning, so that they might be moved during the day. Breaking down adhesions under an anaesthetic was not to be recommended. In some carefully-selected cases in which the knee was flexed, straightening under an anaesthetic to obtain a stiff joint as a result might be considered. The question of excision might arise to relieve bony ankylosis; it could only occur in very chronic cases, and was very rare. The operation was to be recommended only if the general health or wage-earning capacity of the patient were affected.

Diet.—In acute cases the diet was light and nourishing—milk, raw meat juice, broth, eggs, plasmon, etc.; stimulants might be required. In chronic cases low diet should never be given. Good feeding was essential. The meals should be at regular intervals and varied, a good supply of nitrogenous food should be taken daily. Salusbury modified treatment had been recommended; it did not suit all

cases. Also, as many cases of rheumatoid arthritis were due to faulty digestion, some recommended exclusion of meat, and substituting fermented milk. Successful results after persisting with this for a long time had been reported. No hard-and-fast rule could be laid down. The most generally applicable diet was a mixed one. Fats were needed. Virol was probably the best, also milk and cream.

The clothing should be chiefly of wool, and it was well to insert a piece of wash-leather next the skin over the joints. It was important to guard against cold and wet.

The most suitable climate was dry, warm, and equable. The seaside was not advisable, and sometimes seemed to aggravate the condition.

Medicines.—In febrile cases, antiseptics, guaiacol carbonate, creosote, quinine, salol, or salicylates should be given. Salicylate of soda was specially of use where there was a history of rheumatism, and it might be given freely, and should be combined with twice the amount of the bicarbonate. Aspirin and phenacetin relieved pain. Iron and arsenic were the most generally useful of all drugs in improving the health; they were best given in combination. The syrup of the iodide was one of the best forms. In cramps, hyoscyamus or cimicifuga was useful. Morphine and opium were to be avoided; it was scarcely ever necessary to use them. Sulphocarbonate of soda and other remedies must be used for the digestive troubles, and if the stomach was dilated it should be washed out. It was important that oral sepsis should be attended to. The teeth were frequently carious; antiseptic washes should be used freely. For sleeplessness, paraldehyde, phenacetin, and bromides might be given. Where gout was present, colchicum and alkalis were serviceable. Colchicum should be given with caution. An alkaline mixture of quinine was also of use. Other methods of treatment were Bier's method of passive congestion. The chief advantages claimed for it were the relief of pain, which was often very marked, and the prevention of stiffness. It also promoted resolution of thickening in joints and tendons. There were various ways of producing congestion—that with the bandage was the only suitable method for rheumatoid arthritis. Danger need not be anticipated if a broad, soft bandage with plenty of padding were lightly applied.

Massage was of value for relief of pain and in keeping up the nutrition of muscles; it also relieved or prevented stiffness and fixation of joints.

Electricity was useful in many stages of the disease; a full-length bath was preferable to smaller ones.

Radiant heat had a promising future. It seemed the most efficacious form of heat to apply, and heat almost always relieved pain. It could be administered in bed, which was a great advantage and helped with the acute cases; it was good also in some chronic conditions.

Serum or Vaccine Treatment.—Acute infective cases had been treated by hypodermic injections of antistreptococcal serum; nothing very definite could be said at present as to results. If there were present in any case a local suppurative active centre such as endometritis, erosion of cervix, or possibly a similar condition in the nose or mouth, a culture might be made and a vaccine given with good prospect of favourable effect.

Baths were chiefly indicated when the disease was met with early and the patient was in fair general health; they were not admissible in the old and debilitated. The chemical properties of the water used was not of vital importance; the chief point was the mode of application. The objects aimed at were decrease of pain and stiffness, a general improvement in the patient's strength and nutrition, increased elimination by the skin, and absorption of the swelling around joints. Bathing, with its accompaniments, was of the utmost value in suitable cases, and gave great relief or permanent benefit even in some of the most chronic and advanced cases. Change of air and scene, modification of diet, and freedom from home cares and worries were all important adjuncts, and patients should be recommended to visit some health resort every year where such a regimen could be provided. All the facilities for such a course existed in Cheltenham. Photographs were shown to illustrate acute, subacute, and chronic cases.

An interesting discussion followed, in which the President, Drs. COLLINS, WILSON, FINLAY, and CONVER took part. Dr. DENT replied.

LANCASHIRE AND CHESHIRE BRANCH:

MANCHESTER (SOUTH) DIVISION.

An ordinary general meeting of the Division was held at the house of the Chairman, Dr. Percy McDougall, Oak Drive, Fallowfield, at 3.45 p.m. on Wednesday, January 13th, Dr. McDougall in the chair. There were thirteen members present: Drs. Boyd, Vipont Brown, Cotterill, Grant Davie, Edlin, Godson, Goodfellow, Heathcote, Mitchell, Niven, Russen Rhodes, and Stock.

Regrets for Absence.—Regrets for absence were received from Drs. Milson Rhodes and Savers Scott, as well as from Dr. A. Brown Ritchie (school medical officer, Manchester), who had been invited to attend.

Confirmation of Minutes.—The minutes of the last meeting were read and signed.

Consultants and General Practitioners.—The meeting appointed six members as representatives to serve on a subcommittee appointed by the Joint Committee of the Manchester and Salford Divisions to consider the ethical relations between consultants and general practitioners. The following were elected:—Consultants: Drs. Moritz, Westmacott, and Wild; General Practitioners: Drs. Hopkinson, Vipont Brown, and Grant Davie.

Date of Dr. Garstang's Address to his Constituents.—A letter was read from Dr. Garstang appointing May 6th as the date upon which he would address his electorate in this Division as a member of the Central Council.

Ladies' Withington District Nurses' Committee.—A letter was read from the Honorary Secretary of the Ladies' Withington District Nurses' Committee acknowledging receipt of the Division's communication regarding the need for her committee to be in touch with the medical men whose patients were under the nurses' care, and offering to place the services of the Divisional Committee at its disposal whenever an authoritative professional opinion was desired. The Honorary Secretary stated her appreciation of the offer, and said she would communicate further when her committee had considered it.

Earlier Appointment of Representatives of Representative Meeting.—A letter from the Medical Secretary on this subject was read, and it was decided to give it future consideration in order to amend the rule thereto.

Certificates from Hospitals to Out-patients.—A letter from the Medical Secretary was read regarding this practice. The Secretary was instructed to reply that there were no hospitals with out-patient departments in the area of the Division.

Medical Inspection of School Children.—The meeting then considered the report of the Medico-Political Committee on the medical inspection of school children. The Chairman pointed out that the Medico-Political Committee hoped that Divisions would send it information or suggestions relevant to the subject, as well as replies to the questions submitted at the end of the report, whereupon Dr. NIVEN (Medical Officer of Health, Manchester) said that he thought that one of the main features required in the medical inspection of school children was the training or education in observation of the teachers by a competent medical man to detect in the children under their care the commencement of ill-health, the failing of physical strength or lack of normal mental energy, and the sudden onset of important illnesses. He did not mean that teachers must learn the art of diagnosis, which should be left to the medical man, but they should be trained to at once observe a deviation from the healthy normal standard, and be able to immediately report it. He therefore moved the following resolution, which was unanimously agreed to:

That this Division considers it to be an essential part of the medical inspection of school children that teachers shall be trained practically in classes of schools to observe indications of ill-health in the children under their care, and shall forthwith bring these children to the notice of the proper medical authority.

The questions in the report were answered as follows: Question 1 (a)—Does the Division approve of the system of payment per head?—was negatived by 8; 5 members did not vote. Questions (b) and (c), dealing with payments per head, were answered by the foregoing, and were therefore not considered. Question (d)—Does the Division suggest any other method of payment? It was proposed by Dr. COTTERILL and seconded by Dr. VIPONT BROWN:

That this Division is of opinion that the only system of payment for medical inspection of school children that should have the support of the Association is the employment of full-time school medical inspectors at adequate salaries.

Carried *nem. con.* five members abstaining from voting. The subject of "treatment" was about to be considered, but, owing to its importance and the lateness of the hour, it was resolved to continue its discussion on Thursday, January 21st, at 3.45 p.m.

ADJOURNED GENERAL MEETING.

The adjourned general meeting of the Division was held at the house of the Chairman, Dr. Percy McDougall, Oak Drive, Fallowfield, at 3.45 p.m., on Thursday, January 21st, Dr. McDougall in the chair. Thirteen members were present: Drs. Ashton, Boyd, Carnwath, Cotterill, Grant, Davie, Godson, Goodfellow, Featherstone, Heathcote, Hopkinson, Sawers Scott, and Stocks. Dr. A. Brown Ritchie, who was invited to attend, was also present.

Regrets for Absence.—Regrets for absence were received from Drs. Alfred Byers and Russen Rhodes.

Confirmation of Minutes.—The minutes of the last meeting were read and signed.

Joint Committee of Manchester and Salford Divisions.—In reply to a request from the Joint Committee, it was resolved:

That the Honorary Secretary shall send reports to that Committee of the Division's opinions and decisions with regard to the medical inspection and treatment of school children, and other matters of interest dealt with at the meetings of the Division.

Workmen's Compensation Act.—A letter was read from the Joint Committee forwarding the following expression of its opinion, which was unanimously adopted by the meeting:

That in all compensation cases the medical man attending ought to receive notice of the intended visit of a medical referee sent by insurance and other companies.

Friendly Societies and the Medical Profession.—A letter from the Medical Secretary was read drawing attention to a paper to be read by Dr. Pearce, of Trowbridge, on Friendly Societies and the Medical Profession, and asking if members of this Division would care to attend, or if the Division would care to appoint official representatives. It was resolved that any member who gave in his name to the Honorary Secretary as intending to be present should be asked to represent the interests of the Division.

Inspection of School Children.—The CHAIRMAN ruling that this subject could be reopened, it was unanimously resolved, regarding tenure of office:

That this Division considers it essential that such officers should be appointed without reference to time, and subject to a reasonable notice; and, further, that the appointment should not be terminated without the consent of the Board of Education.

Regarding Treatment of School Children.—It was unanimously resolved:

That this Division is of opinion that, wherever possible, children who are found defective should be referred to their own private practitioner.

It was proposed by Dr. COTTERILL, seconded by Dr. CARNWATH:

That if and when children are treated by the Education Authority, such treatment shall be undertaken by whole-time medical officers.

Four voted for and 5 against this resolution, which was lost. It was proposed by Dr. SCOTT and seconded by Dr. DAVIE:

That this Division is of opinion that any attempt by public authorities to arrange for the treatment of school children at hospitals and other charitable institutions is thoroughly unsound in principle.

Carried with one dissident. Dr. BROWN RITCHIE, Medical Officer for School Children, Manchester, then detailed the system in vogue in this city. He pointed out that children were advised to seek the advice of their own medical attendant, and in the case of the very poor were sent to hospital. He showed that the drawing of the line between those able to pay for medical attendance and those unable to do so was in many instances extremely difficult. He strongly deprecated the subsidizing of hospitals or other charitable institutions, and urged that the system as at present carried out in Manchester should

be allowed to continue until the hospitals objected to the overtaxing of their resources, when in all probability school clinics or some such organization would be created to meet the conditions prevailing. He was in favour of this drifting policy. He saw many difficulties in the way of at present coming to a hard-and-fast conclusion, but he sincerely hoped, if the Association proposed a scheme of any sort, that it would see that such a solution was a practical one—one that education and local authorities could agree to. As the subject had such far-reaching possibilities it was agreed to give the Division further time to consider the report, and it was resolved to adjourn until Friday, January 29th, at Dr. Ashton's house.

FURTHER ADJOURNED GENERAL MEETING.

The second adjourned general meeting of the Division was held at the house of Dr. George Ashton, 315, Wilmslow Road, Fallowfield, at 3.30 p.m. on Friday, January 29th, Dr. McDougall in the chair. Twelve members were present: Drs. Ashton, Boyd, Carnwath, Cotterill, Grant, Davie, Edlin, Gregory, Russen Rhodes, Sawers Scott, Stocks, and Wild. There were also present by invitation Mr. Ray and Mr. Telford.

Regrets for Absence.—Regrets for absence were received from Drs. Vipont Brown, Hopkinson, Niven, and Milson Rhodes.

Confirmation of Minutes.—The minutes of the last meeting were read and signed.

Ladies' Withington District Nurses' Committee.—A letter was read from this committee, stating that at their meeting held on January 25th it was unanimously resolved that it was willing for the Division to appoint a delegate to consult with its executive committee when questions arose requiring professional medical opinion. The Chairman, Dr. McDougall, was unanimously appointed the official delegate of the Division.

Treatment of School Children (continued).—The further consideration of "treatment" was opened by the CHAIRMAN reading extracts from a paper on the subject by Dr. Priestly, a late member of the Division, and now Senior School Inspector for the County of Staffordshire, in which he stated that the question could be treated from three points of view: (1) The principle of relying on parental responsibility. (2) The use of existing machinery—general practitioners, Poor-law officers, hospitals, etc. (3) The formation of school clinics. He, however, offered no solution. Mr. TELFORD detailed the system at Pendlebury hospital out-patient department. He said they were being "flooded out" with children. They came with notes from the school authorities in masses for such operations as removal of tonsils and adenoids. He did not consider this just either to the children, who had sometimes to go long distances to their homes after operation, or indeed, to the hospital staff. At present the hospital managers seemed desirous of approaching the school authorities for payment, but this abused the reason why hospitals were founded. School attendance officers made inquiries into the home circumstances of the parents, so that he considered that the children might be divided into two main classes: (1) Those who were proper recipients of outdoor relief, and (2) those who could pay a reasonable fee to their own private practitioner, who, if he did not feel competent to deal with the case, could refer the case either to hospital, as at present was done, or to an operating surgeon privately. Speaking generally, the Pendlebury Hospital patients were drawn from so large an area that the officer appointed to make inquiries and inspect the houses from which the patients were drawn had too great an area to cover, and thus could only inspect those nearer at hand, which worked out at about one in three patients treated. Mr. RAY said that undoubtedly there was a very great proportion of children who required treatment. Medical inspection did not manufacture patients, but simply brought to light those requiring treatment which for some reason or other did not get it. He considered that the existing agencies for the present sufficed, and hoped that no special men would be appointed to undertake treatment. After further argument, it was proposed by Dr. COTTERILL and seconded by Dr. EDLIN:

That this Division considers that school clinics should be established for the purpose of treating defective school children.

An amendment by Dr. WILD, seconded by the CHAIRMAN, moved that there should be added:

... but that, wherever possible, children should be referred to their own private practitioner.

Carried *nem. con.* The resolution was then put to the meeting as follows:

That this Division considers that school clinics should be established for the purpose of treating defective school children, but that, wherever possible, children should be referred to their own private practitioner.

For the resolution, 6; against, 4. Carried. Regarding the subject of whole or part time appointments, it was pointed out that, when considering the subject generally at the previous meeting, the Division by a majority of 1 objected to the treatment being undertaken by whole-time medical officers (4 for, 5 against); but now that the Division approved of school clinics, it was proposed by Dr. CORTERILL and seconded by Dr. STOCKS:

That the treatment in school clinics shall be undertaken by whole-time medical officers at fixed salary, and that this shall commence at not less than £250 per annum.

For the resolution, 6; against, 2. Carried. It was proposed by Dr. STOCKS, seconded by Dr. SCOTT:

That this meeting is of opinion that it is of the highest importance that in each and every district a wage limit be adopted, and that no child be deemed eligible for treatment at the expense of the education authority where the income exceeds this limit.

Carried with one dissentient. The SECRETARY was requested to record the numbers of those voting for and against the resolutions.

This concluded the business.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION.

A GENERAL meeting of this Division was held at the Great Eastern Hotel, Liverpool Street, E.C., on January 28th, at 5.30 p.m. Dr. GOODALL presided, and seven other members were present.

Confirmation of Minutes.—The minutes of the two previous general meetings were read, confirmed, and signed by the Chairman.

The Earlier Appointment of a Representative.—With regard to the proposal to alter the rule appointing a Representative from not more than three months to not more than 9 months before the annual meeting, it was resolved that this be deferred until the annual meeting of the Division.

Medical Inspection and Treatment of School Children.—The following answers to the questions of the Medico-Political Committee *re* the inspection and treatment of children found defective on inspection were ordered to be sent to that Committee:

1. That as the London County Council have already made fixed salaries their system of remuneration this Division does not think that it is competent, or of any use, to answer this question.
2. That payment should be by fixed salary.
3. That the appointments be thrown open to all practitioners, by advertisement, etc.
4. That the number of school clinics should depend on the population, and on the area of the school districts.
5. That this Division does not feel competent to answer this question; as it is a legal one.

Medical Officers of Health.—This Division was also asked to reply to the query of the Public Health Committee *re* the advisability of making the appointment as medical officer of health a full-time one. It was resolved:

That this Division considers that, as far as possible, they should be full-time appointments, but that in certain rural districts they must of necessity be part-time appointments.

Proposed Entertainment Fund.—A proposition was sent up from the Executive Committee, asking the opinion of the Division *re* the formation of an entertainment fund, and it was resolved:

That reply postcards be sent to each member of the Division, asking if they would be willing to subscribe 1s. per annum for the formation of such a fund.

The meeting then terminated.

MARYLEBONE DIVISION.

A GENERAL meeting of the Division was held on Friday, January 29th, at 5 o'clock, at the Rooms of the Medical Society of London. Dr. F. DE HAVILLEAND HALL, Chairman of the Division, presided.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Question as to Resignation.—Dr. HAWTHORNE asked for information concerning the resignation of members of the Association during the year 1908 who were members of the Marylebone Division. The Honorary Secretary was instructed to procure such information from the central office.

Central Emergency Fund.—Dr. HAWTHORNE asked for information concerning the steps taken by the Executive Committee with reference to the Central Emergency Fund. The matter was referred to the Executive Committee for a report thereon.

Report on Annual Representative Meeting.—Sir VICTOR HORSLEY, the Representative in Representative Meetings, then presented his report. He referred at some length to the principal matters discussed at the Sheffield meeting, and more particularly to the Hospitals Committee's report, the Charter, report of the Finance Inquiry Committee, report on the Ethics of Consultation, and the Central Ethical Committee's report. After the CHAIRMAN had referred to the services rendered to the Division by Sir Victor Horsley, Dr. F. J. SMITH proposed and Dr. LAURISTON SHAW seconded:

That a hearty vote of thanks be accorded Sir Victor Horsley for his services as Representative.

Dr. HAWTHORNE in supporting the resolution asked to be informed of the Representative's action in regard to the Central Ethical Committee's report in so far as it referred to the general adoption of the Bradford rules. Sir VICTOR HORSLEY pointed out that this point did not come up as a recommendation, and was therefore not voted upon. The resolution was thereupon carried unanimously.

Medical Inspection and Treatment of School Children.

The meeting then proceeded to the consideration of the report of the Medico-Political Committee on the medical inspection of school children.

Section 3, Systems of Payment. (i) *By Fixed Salary.*—It was proposed by Dr. HERON, seconded by Dr. F. J. SMITH, and carried:

That the salary of the school medical officer should be arranged with a definite rate of increase of salary and provision for pension on conditions similar to those holding in His Majesty's higher civil services.

(ii) *Salary Based upon Time Spent in Work. Part-time Officers.*—The recommendation of the Association was agreed to.

(iii) *Inclusive Payment per Head.*—It was proposed by Dr. F. J. SMITH, seconded by Dr. DUDLEY BUXTON, and carried:

That where inclusive payment per head is adopted the minimum fee shall be 2s. 6d.

Treatment of School Children found Defective.—It was proposed by Dr. F. J. SMITH, seconded by Dr. HAWTHORNE, and carried:

That in the opinion of this Division it is absolutely essential that the system of school clinics or recognized surgeries be established.

It was proposed by Sir VICTOR HORSLEY, seconded by Dr. DUDLEY BUXTON, and carried:

That the appointments to the staff should be open to all registered medical practitioners, the medical practitioners of the district working as part-time officers having preference.

It was proposed by Mr. CHARLES RYALL, seconded by Dr. LAURISTON SHAW, and carried:

That the staff should be remunerated adequately upon a scale agreed upon by the local Division.

WESTMINSTER DIVISION.

A SPECIAL meeting of this Division was held at the Florence Restaurant on January 21st, Dr. WILLIAM EWART, President, in the chair. The meeting was convened to discuss the report of the Central Medico-Political Committee on the Treatment of School Children found to be defective. Dr. SEaton KERR, of the Board of

Education, was the guest of the Division on this occasion.

Report of Medical Secretary.—The monthly report of the Medical Secretary, adjourned from the previous meeting, was read by the SENIOR HONORARY SECRETARY.

Departmental Inquiry on Coroner's Law.—Dr. Morgan Finucane (Barrister-at-law) was unanimously elected the Representative of the Division on the special committee appointed by the Central Council to collect evidence to lay before the Departmental Committee appointed by the Government to report on the coroner's law.

Treatment of Defective School Children.—At the request of the PRESIDENT, Dr. COX (Assistant Medical Secretary to the Association) gave a short review of the matters which led up to the report of the Medico-Political Committee on the treatment of defective children.

Mr. HARVEY HILLIARD then opened the discussion on the report. He said all present must feel that unless the arrangements for the medical inspection of school children were to remain ineffective, this must be supplemented by proper treatment of those found to be unfit. This would necessarily involve a considerable cost, but it would be an expense which it would be sound economy to incur. He was convinced that the inefficient, the workless, and the unemployable owed their deplorable condition largely to the fact that they were born and bred in an environment which necessarily produced grave physical, mental, and moral defects, and which, remaining untreated in their earlier years, resulted in their developing into useless members of society and a danger to the public health. It was to the interest, not only of the State, but of every individual, to prevent the development of this condition of things; he looked forward to the time when not only the defective children would be dealt with by the State, but to the time when the State would prevent women giving birth to children in an environment which could not fail to produce disease. The present meeting was called to consider the best way in which this work of the State might be undertaken, not only from the point of view of the interests of the medical profession, but also with due regard to the public good. Every one must feel the imperative desirability of active and intimate co-ordination between all the departments of State, whether imperial or parochial, and he felt that this new duty assumed by a branch of the State—namely, the Board of Education—of making the children, whom it undertook to educate, in a fit condition to assimilate properly the education provided for them, should be performed by means of such machinery as already existed. It was clear that the machinery which at present existed was in certain respects inadequate as regards staff, etc., for the whole of this new work, but he was convinced that it would be more economical to enlarge the existing machinery than to start new and independent schemes for dealing with the matter. The Education Committee of the County Council had made virtually three proposals with regard to the manner in which the treatment of defective children should be carried out:

(1) That existing hospitals should be made use of as heretofore, for those cases which needed "in-patient treatment";

(2) That existing institutions (provident dispensaries, etc.) should be made use of wherever possible under a subsidy; and

(3) That where such institutions did not exist in school areas the school authority should itself erect and equip school surgeries or clinics.

The first of these proposals might safely be left to the hospital authorities, who would soon find that they were swamped by the extra work put upon them, and their resources inadequate to deal with it, if they were to be just to the claims of the rest of the community. The second proposal he said was inherently wrong in principle, and would be found to be impracticable in working; and furthermore it would overlap with an already existing department of State—namely, Medical Department of the Poor Law. The third proposal was ill-considered and extravagant, for it likewise covered the already existing machinery of the Poor Law, which with a little enlargement and improvement could be made amply adequate to deal with any demand the education authority might make upon it. He spoke as a ratepayer rather than as a medical man in this connexion, and urged all ratepayers to resist this fresh extravagance of the County Council, and to prevent the waste which always resulted from the overlapping of various organizations doing the same work. A

glance at the map of London would reveal the fact that in every school area there exists some Poor-law institution, so that the children from any school could be sent to it after it had been modified and equipped to suitably treat them. It would be noticed that in very few areas did there exist such a dispensary or other institution as the Education Committee had in view. It would therefore follow that a very large number of school clinics would be required, and a very grave expense would be incurred. In his view, the Education Committee should confine itself to education, and should call in the aid of a co-department of State responsible for such work when it required medical treatment for its scholars. If this work with the school children were referred to the Poor Law, it would be the best thing for the profession, for large numbers of men in general practice and specialists would necessarily be added to the Poor-law service, and they would thus become servants of the Local Government Board and of the State, which he considered would be preferable to being the servants of a parochial board of school managers. He thought that the objection of the stigma of pauperism which was raised to this proposal to send the poor children to be treated by the Poor Law was entirely one of ill-balanced sentiment. First, because in the near future those coming under the Poor Law would be classified, because medical relief would be dissociated from other forms of relief, and because already medical relief involved no disfranchisement. He failed to see the difference between a person who accepted treatment in a voluntary hospital and he who accepted it in a Poor-law hospital except that in the latter case the person was only receiving something of what he had already paid for in the rates, whereas the former case was much more a real pauper, because he accepted charity to which he had probably contributed nothing. He would ask, Do the people incur the stigma of pauperism because their children are educated out of the rates? Do they incur the stigma of pauperism if they accept food at the schools under the Provision of Meals Act? Do they incur the stigma of pauperism if when sick they are removed to one of the various hospitals or institutions of the Metropolitan Asylums Board? If asked, they would invariably say No. Why, then, should they complain of the stigma of pauperism if they accept medical treatment from an infirmary which was likewise supported out of the rates? He considered that it was the State's duty, and it would be to the State's interest, to provide free medical treatment for all children requiring it and where parents would accept it. He felt also that it was the right of those people who were not in a position to pay for the medical aid they required, to look to the State in their need. He therefore again moved, in answer to the questions put by the Medico-Political Committee, the resolution which was adopted by the Division and moved by their Representative in the Representative Meeting at Sheffield, namely:

That the Westminster Division feels that the logical conclusion of the medical inspection of school children is the provision of treatment, where this is found to be necessary, and that as the machinery of the Poor Law already exists for the medical relief of all persons unable to pay medical fees, the school children should be referred to the Medical Department of the Poor Law, which should be reorganized and extended to meet the demand for the increased medical relief which will arise.

Dr. KERR characterized Mr. Hilliard's speech as a curious mixture of Socialism and early Victorian Toryism. In his view there were practically only three defects of school children that they need consider—namely, diseases of eyes, ears, and teeth. These he considered the existing hospitals and other institutions quite incapable of dealing with, and thought that the only way was to start independent school clinics with an adequate staff. He agreed with Mr. Hilliard that it was a bad policy to draft the work on to dispensaries under a subsidy. His proposal would be a good thing for the profession if they accepted the terms offered by the education authority, for the doctors would then be paid for work which at present, owing to the neglect of parents, was not done at all. If, however, the profession, through the British Medical Association, stood out against the terms offered, on the grounds of inadequacy of remuneration, he felt they were fighting a losing cause, for it was evident that it would be easy to obtain the services of young men who would be glad of a certain income, although small.

He did not think a man should be classed as a pauper because he could not afford to pay for special treatment for defective eyes, ears, or teeth, from which he or his children might suffer. It was futile to try and recover the cost of such treatment, and he looked forward to the time when the State would provide free medical treatment for every one who did not pay income tax.

Dr. ARCHER disagreed with Dr. Kerr, who first said the work required needed the skill of specialists in diseases of the eyes, ears, and teeth, and then threatened the Association that young men seeking experience would be appointed if the Association stood out with regard to fees. In any case it was clear the general practitioner would stand to lose if school clinics were established, because, owing to the nature of his work, he could not be tied down to attend the school at definite hours. He thought that all cases except those needing specialists should be sent to local practitioners, paid by the State per case.

Dr. FINUCANE, in agreeing with Dr. Kerr, characterized Mr. Hilliard's proposal as reactionary and unjust to the respectable poor. From his own knowledge as a Poor-law medical officer he could say that most people avoided it as long as they could. He was convinced that it was to the interest of the State that the defective children should be treated, but he thought this treatment should be provided free and without stigma.

Dr. HASLIP said he supported Dr. Hilliard, and therefore held, according to Dr. Kerr, early Victorian views; but he might say that many objected to have their opinions dictated to them by the London County Council. He said: "The real objection to a school clinic, under educational authority, means one more centre for free medical services, which makes the system of medical relief further complicated—(1) hospitals, (2) Poor Law, (3) educational school clinics. Dr. Kerr said school clinics were required only for five diseases: (1) Teeth, (2) vision, (3) ringworm, (4) discharging ears, and (5) adenoids. Consequently, the scheme was not comprehensive. Nothing was mentioned of malnutrition and other diseases from which children suffered. It would not benefit general practitioners. Specialists were required for Nos. 1 and 2, and with regard to dentists, Dr. Kerr had told them that there was not a sufficient number in London to look after the teeth of the school children. Consequently men also were required. With regard to ringworm, apparatuses were required for the treatment. For No. 4 (discharging ears) this had been shown to be chiefly a question of nurses being required." Dr. Haslip continued: "In my opinion school clinics will develop eventually into another large out-patient department, attended by specialists who will be paid in future for their services; and what guarantee will the practitioners have that these clinics will not be abused? It is necessary that there should be some control over the financial status of parents. This is not only fair to the medical profession but also to the taxpayers. Now, the wording of the resolution of our Division is that the medical department of the Poor Law should be reorganized and extended to meet the demand for the increased medical relief which will arise; and this view is contemplated also in the report of the Medico-Political Committee on page 6, where it says:

It is possible that the provisions of the scheme of school clinics would be incorporated in the reorganized Poor-law system.

I say, let your specialists be appointed—eye, ear, throat, and also dentists—but let the guardians, or their successors, whoever they may be, pay for them. Call it a public medical service if you like. Why should the London County Council build new school clinics? You have already infirmaries in various parts of London, with plenty of room for the cases to be referred to them, and if the building is not sufficiently equipped, this can soon be done. If there is not the necessary staff they can soon be appointed. One knows the marvellous improvements that have taken place in the medical treatment in infirmaries the last ten years; in fact, I have known patients prefer to be treated in infirmaries to hospitals. Why should there not be further improvement in the outdoor medical relief, and if necessary called by some other name? I maintain there is no hurry over this question until the report of the Poor Law Commission has been issued, and the Association should wait before they commit themselves to any scheme."

Dr. F. J. ALLAN, Medical Officer of Health for West-

minster, drew attention to the gradual supersession of the responsibility of parents which had been taking place, and the progress towards making the children into "State children"; 40,000 children had been fed in 1907-8, and according to the evidence of the teachers and others this had been grossly abused. Parliamentary committees and Government departments had pronounced against medical inspection growing into medical treatment, but if precedents throw any light on the possible trend of events, it looked as if free treatment would follow. He quoted Herbert Spencer, who said, in his *Study of Sociology*, that

Everywhere there is a tacit enunciation of the marvellous doctrine that citizens are not responsible individually for the bringing up of each of his own children, but that these same citizens incorporated into society are each of them responsible for the bringing up of everybody else's children.

Thousands of parents would not secure medical treatment for their children, so the State would be driven to provide it at the expense of the ratepayer unless drastic supervision was to be exercised. An attempt would doubtless be made to exploit the medical profession, and therefore it was essential that a firm stand should be made. The scheme of providing school clinics would not benefit the general practitioner, as suggested by Dr. Kerr. Specialists might be appointed for the treatment of eye, ear, and teeth defects; but these formed but a small part of the ailments of children, and some scheme was required which would utilize the services of the general practitioners of a district. He objected to hospitals being subsidized for the purpose. Dr. Allan suggested that when as the result of school inspection a notice had to be given to the parents (see Section 10 of the Medico-Political Committee's Report), a copy should also be sent to the Care Committee, who should take steps to see that attention was given to it by the parents, failing which the Care Committee should be empowered to institute proceedings against the parents.

Finally, after prolonged discussion, the following answers to the questions asked by the Medico-Political Committee were agreed to:

1. (a) Does the Division approve of the system of payment per head?—No.
(b) If so, should it be such as has been adopted in Hertfordshire? or in Derbyshire?—No.
(c) Or a fixed minimum payment per head of school attendances, and if so, what payment?—No.
(d) Or does the Division suggest any other method of payment?—Yes; by fixed salary on the basis of time given according to the scale laid down by the Association.
2. Considering the matter with special regard to your local conditions, what are the views of the Division as to the size and method of selection of the Staff of the School Clinic, if the establishment of such should be proposed, and how do you think that they should be remunerated, e.g., by (i) fixed salary; (ii) payment by time; (iii) payment per case, or by what other method?—Same as (d) supra.
4. What suggestions, if any, have Divisions to offer as to the methods which are to be adopted to ensure that parents who can afford to pay for the treatment of their children, when found defective as the result of medical inspection of school children, should be compelled to do so?—That since the logical conclusion of the medical inspection of school children is the provision of treatment, where this is found to be necessary, and since the machinery of the Poor Law already exists for the medical relief of all persons unable to pay medical fees, the school children should be referred to the medical department of the Poor Law, which should be reorganized and extended to meet the demand for the increased medical relief which will arise.

OXFORD AND READING BRANCH:

OXFORD DIVISION.

Medical Inspection of School Children.—A special general meeting of this Division was held on January 27th, at the Radcliffe Infirmary, Oxford, to discuss the questions submitted by the Medico-Political Committee with regard to the medical inspection of school children. Mr. WHITELOCKE (Chairman) presided, and about seventeen members attended, together with two or three part-time inspectors not members of the Division. The SECRETARY (Dr. DUIGAN) gave an outline of the report of the Medico-Political Committee on the subject. After considerable discussion, the questions on p. 11 of the report were submitted by the CHAIRMAN to the meeting:

- (a) The system of payment for part-time inspectors, per head was unanimously approved.
- (b) Neither the Hertfordshire nor Derbyshire system was approved.

- (c) As to system of payment: the present scale of payment of part-time inspectors in the Oxford District (2s. per head, without further allowances) was unanimously declared to be insufficient. Stress was laid by many speakers on the distances that had to be travelled, and the large amount of clerical work demanded of the inspectors.

It was proposed by Dr. SUMMERHAYES, and seconded by Dr. CAUDWELL:

That the scale approved by the Reading Branch (capitation fee of 2s. and 3d. for every child on the school books, and 3d. per head for travelling and secretarial expenses, 2s. 6d. in all) be approved by the Oxford Division.

An amendment was proposed by Dr. H. FREEBORN, and seconded by Dr. ORMEROD:

That this meeting does not approve the present scale of payment of part-time inspectors within the Oxford district, but is not at present prepared to define the amount which should be paid.

This amendment was carried by a majority of 2 votes.

Treatment of Defective Children.—The meeting then considered the question of treatment of defective children. Dr. ORMEROD (M.O.H. for the City of Oxford) said in his opinion there was no need for school clinics in the city. He thought perhaps the most important item of inspection was with reference to pediculi on the head and body, and that a competent nurse could deal with these cases. Dr. MORTON (whole-time inspector for the county) considered that the chief difficulty had reference to ophthalmic cases and the increased work entailed at the Eye Hospital. This was being investigated, and they had no data yet. Dr. STEWMAN (Reading District) thought that, with the exception of diseases of the eyes and teeth, the present facilities for treatment were sufficient, and that it was very inadvisable to encroach in any way upon the private practitioner. He suggested that there should be travelling specialists to deal with diseases of the eyes and teeth in the rural districts. After further discussion it was finally proposed by Dr. H. FREEBORN and seconded by Dr. CAUDWELL:

That this meeting considers that the existing facilities for treatment of defective school children in this district are sufficient for all cases except dental cases, and that for these some provision should be made.

This was carried unanimously.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

SURGEON J. W. ROBERTSON, M.B., has been promoted to be Staff Surgeon, from May 15th, 1907. He was appointed Surgeon May 15th, 1899.

The following appointments have been made at the Admiralty: Fleet Surgeon R. C. MINNICK, Staff Surgeon A. J. LAURE, and Surgeon E. M. W. HEARN to the *Royal Arthur*, February 10th, and Surgeon H. H. HAYCROFT on re-commissioning, United; Fleet Surgeon F. H. A. CLAYTON, M.D., Staff Surgeon T. B. VICKERS, H. L. GEORGEHAN, M.D., and Surgeon R. H. ASTRIN, M.B., to the *Royal Arthur*, for the voyage home, undated; Staff Surgeon W. E. PATTERSON to the *Dido*, on re-commissioning, February 15th; Staff Surgeon G. GRISON and Surgeon G. S. DAVIDSON to the *Sophonis*, on re-commissioning, February 9th; Surgeon E. S. WILKINSON, M.B., to the *Royal Arthur*, February 10th, and to the *Lynx*, on re-commissioning, undated; Surgeon L. HAYES to the *Warrior*, February 10th; Surgeon F. H. STEPHENS to the *Defence*, February 10th; Fleet Surgeon F. W. PARKER to Malta Hospital; Fleet Surgeon A. H. L. COX to the *Commonwealth*, February 6th; Surgeon A. D. SPALDING to the *Tiger*, additional, for deckward duties, February 25th; Surgeon F. L. J. M. DE VERBULLE to the *Pembroke*, additional, for the *Endymion*, February 25th.

Mr. J. RANKIN, M.B., civil practitioner, has been appointed Surgeon and Agent at Boyne and Clogher, January 4th.

ARMY MEDICAL SERVICE.

COLONEL O. E. P. LLOYD, V.C., who is serving in India, is appointed Principal Medical Officer, 7th (Meerut) Division.

Colonel M. W. D. MURPHY, M.B., who is serving in India, is appointed Principal Medical Officer, Bareilly and Garhwal Brigades.

ROYAL ARMY MEDICAL CORPS.

CAPTAIN A. J. WILLIAMS, M.B., has been appointed Specialist in Operative Surgery at the Royal Herbert Hospital, Woolwich.

INDIAN MEDICAL SERVICE.

LIEUTENANT-COLONEL H. W. STEVENSON is appointed Surgeon-General with the Government of Bombay. He joined the Bombay Medical Department as Assistant-Surgeon, April 2nd, 1881, and became Lieutenant-colonel, April 2nd, 1901. He has no war record in the Army List.

Lieutenant-Colonel T. H. SWANNY, Bengal, is permitted to retire from the service, from March 1st. He was appointed Surgeon, September 30th, 1878, and was made Lieutenant-Colonel, September 30th, 1898. He was in the Afghan war in 1879-80, being present in the operations at and around Kabul in December, 1879 (medal with clasp).

Colonel H. L. MCKAY, C.I.E., Bengal, is appointed Principal Medical Officer, Burma Division.

Colonel W. O'HARA, Madras, is appointed Principal Medical Officer, 9th (Secunderabad) Division.

TERRITORIAL FORCE.

SURGEON-LIEUTENANT-COLONEL R. E. WOOD, from the Lanarkshire Imperial Yeomanry, to be Surgeon-Lieutenant-Colonel, Lanarkshire Yeomanry, with precedence as in the Volunteer Force, April 1st, 1908.

ROYAL GARRISON ARTILLERY.

Surgeon-Captain A. W. SCOTT, from the 2nd East Riding of Yorkshire Royal Garrison Artillery (Volunteers), to be Surgeon-Captain, East Riding Regiment, with precedence as in the Volunteer Force, April 1st, 1908.

ROYAL ARMY MEDICAL CORPS.

The announcement of the appointment of Lieutenant-Colonel R. H. WOOD, which appeared in the *London Gazette* of October 20th, 1908, is cancelled.

SURGEON-LIEUTENANT-COLONEL AND HONORARY SURGEON-COLONEL J. K. PHILLIP, M.B., from the 2nd (Amulsi) Volunteer Battalion, the Black Watch (Royal Highlanders), to be Lieutenant-Colonel, with the honorary rank of Surgeon-Colonel, with precedence as in the Volunteer Force, April 1st, 1908.

SURGEON-LIEUTENANT-COLONEL AND HONORARY SURGEON-COLONEL T. PHILLIP, M.B., from the 1st (Renfrewshire) Volunteer Battalion Princess Louise's (Argyll and Sutherland Highlanders), to be Lieutenant-Colonel, with the honorary rank of Surgeon-Colonel, with precedence as in the Volunteer Force, April 1st, 1908.

Field Attachment to Units of the Territorial Medical Units.—**JOHN C. S. BERRITT, M.D.**, to be Lieutenant, May 15th, 1908; **CHARLES D. MATHIAS**, to be Lieutenant, May 25th, 1908; **Lieutenant HERBERT MEGGITT**, to be Captain, May 25th, 1908; **CHARLES E. M. JONES** to be Lieutenant, January 15th, 1909.

Yorkshire Mounted Brigade.—**Field Ambulance.**—**JOHN HEPPLE** to be Lieutenant, January 1st, 1909.

ROYAL FIELD ARTILLERY.

SURGEON-CAPTAIN E. G. PIERCE, from the 2nd West Riding of Yorkshire Royal Garrison Artillery (Volunteers), to be Surgeon-Major, 2nd West Riding Brigade, April 1st, 1909.

COLONIAL MEDICAL SERVICE.

The following gentlemen have been appointed to the West African Medical Staff: **Lieutenant-Colonel H. C. S. COLEMAN**, Southern Nigeria, W. F. ROACH, M.D., M.S. Montreal, Southern Nigeria, F. W. MCCAY, L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg., Northern Nigeria, E. J. PORTEROS, M.B., Ch.B. Edin., Northern Nigeria, A. M. DOWDALL, M.C.S. Edin., L.R.C.P., L.R.C.S. Edin., Gold Coast, E. W. THAYER, M.B., B.Ch. R.U.I., Gold Coast, J. MC DONAGH, M.B., Ch.B. R.U.I., Sierra Leone, P. J. KELLY, M.B., Ch.B. Glasg., Gold Coast, R. E. MCCONNELL, M.D., C.M. McGill Univ., D.T.M. Liverpool Univ., Gold Coast, A. E. NEALE, M.D., M.D., Southern Nigeria, Southern Nigeria, M. J. M. COLEMAN, Ch.B. Glasg., Southern Nigeria, S. L. G. D. MAGNAN, L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg., Southern Nigeria, T. H. STEPHEN, M.B., Ch.B. R.U.I., Southern Nigeria, F. G. SHARPE, L.R.C.P., L.R.C.S. Irel., Gold Coast.

Retirements.

J. DAVISON, M.B., Ch.B., Medical Officer, Northern Nigeria, from July 9th, 1908; **E. J. MOORE, F.R.C.S., L.R.C.P. Irel.**, Medical Officer, Southern Nigeria, on Pension, from October 15th, 1908; **J. C. BURRICH, L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg.**, Medical Officer, Gold Coast, on pension, from January 15th.

Resignations.

J. THORP WALZE, L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg., Medical Officer, Northern Nigeria, from August 12th, 1908; **H. W. GESS, M.B., Ch.B. Edin.**, Medical Officer, Gold Coast, from August 2nd, 1908; **R. H. FRIEDEL, L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg.**, Medical Officer, Southern Nigeria, from December 6th, 1908.

Death.

H. T. COOKMAN, L.R.C.P., L.R.C.S. Irel., Medical Officer, Gold Coast, at Cayenne Coast, on January 9th, from paralysis and heart failure.

Vital Statistics.

ENGLISH URBAN MORTALITY IN THE FOURTH QUARTER OF 1908.

[SPECIALLY REPORTED FOR THE BRITISH MEDICAL JOURNAL.]

In the accompanying table will be found summarized the vital statistics for seventy-six of the largest English towns, based upon the Registrar-General's weekly returns for the fourth quarter of last year. The last quarter was distinguished in these towns during the quarter under notice were equal to an annual rate of 25.0 per 1,000 of the population, estimated at 16,254,952 persons in the middle of 1908; in the corresponding quarters of the three preceding years the rates were 26.6, 26.5, and 25.6 per 1,000 respectively. In London the birth-rates of the quarter were equal to 25.6 per 1,000, in the seventy-five other large towns averaged 25.6, and ranged from 13.4 in Hastings, 14.9 in Hornsey, 16.5 in Hounslow, 17.6 in Halifax, 19.0 in Bedford and 19.1 in Reading, to 33.9 in Swansea, 32.0 in Tynemouth, 33.3 in St. Helens, 32.5 in Middlesbrough, 33.4 in Middlesbrough, and 39.3 in Rhondda.

The 64,357 deaths registered in these towns last quarter were equal to an annual rate of 14.8 per 1,000, the rates in the three preceding fourth quarters having been 15.8, 16.2, and 15.8 per 1,000. The death-rate in London last quarter was equal to 15.7 per 1,000, while among the seventy-five other large towns it averaged 15.2 per 1,000, and ranged from 7.6 in Hornsey, 8.9 in King's Norton, 9.2 in East Ham, 9.5 in Leyton, 9.8 in Wandsworth (St. Pauls), and 9.9 in Hastings, to 19.0 in Stockport, 19.1 in Rochford, 19.2 in Rochdale, 19.3 in Preston, 19.8 in Oldham, 20.4 in Tynemouth, and 21.9 in Middlesbrough.

The 64,357 deaths from all causes included 6,540 which were referred to the principal infectious diseases; of these 1,619 resulted from measles, 479 from scarlet fever, 305 from diphtheria, 54 from whooping cough, 497 from "fever" (principally enteric), and 2,631 from diarrhoea, but not any from small-pox. These 6,540 deaths corresponded to an annual rate of 1.49 per 1,000, the death-rates from the same diseases in the fourth quarters of the three preceding years having been 1.57, 1.72, and 1.68 per 1,000. The rate of mortality in London last quarter from these principal infectious diseases was equal to 1.25 per 1,000, while it averaged 1.61 per 1,000 in the seventy-five other large towns, among which the rates ranged from 0.11 in Hastings, 0.38 in Hornsey, 0.52 in Northampton, 0.44 in Epsom, 0.54 in Barrow-in-Furness, 0.57 in Plymouth, and 0.8 in Hirkstead, to 2.74 in Grimsby, 2.75 in Preston

Analysis of the Vital Statistics of Seventy-six of the Largest English Towns during the Fourth Quarter of 1908.

Towns.	Estimated Population middle of 1908.	Births.	Deaths.	Births. per 1,000 Living.	Deaths. per 1,000 Living.	Principal Infectious Diseases.	Deaths from Principal Infectious Diseases.	Small-pox. 2.82 in Rochdale, 2.98 in Warrington, 3.27 in Huddersfield, 3.55 in Leicester, 5.61 in Rotherham, and 5.75 in Middlesbrough.

The 1,619 deaths from measles were equal to an annual rate of 0.37 per 1,000; in London the death-rate from this disease was equal to 0.35 per 1,000; in the seventy-five other large towns it averaged 0.38, and was highest in Tottenham, Leicester, Rochdale, Huddersfield, Rotherham, and Middlesbrough. The 479 fatal cases of scarlet fever corresponded to an annual rate of 0.11 per 1,000; in London also the scarlet fever death-rate was 0.11; among the seventy-five other large towns this disease was proportionally most fatal in Handsworth (Staffs), West Bromwich, and Huddersfield. In Huddersfield the annual rate of 0.60 deaths from diphtheria were equal to an annual rate of 0.18 per 1,000; the rate in London was 0.17 per 1,000, while it averaged 0.19 in the seventy-five other large towns, and was highest in Croydon, East Ham, Devonport, Kingston, South Shields, and Huddersfield. The 134 fatal cases of whooping-cough corresponded to an annual rate of 0.12 per 1,000; in London the death-rate from whooping-cough was 0.07 per 1,000, while it averaged 0.14 in the seventy-five other large towns, among which this disease showed the greatest proportional mortality in Wolverhampton, West Bromwich, Wigan, Rotherham, Huddersfield, Tees, and Tynemouth. The 497 deaths referred to different forms of "fever" were equal to an annual rate of 0.11 per 1,000; in London the rate was 0.09 per 1,000, while it averaged 0.12 in the seventy-five other large towns; and was highest in Devonport, Hanley, Grimsby, Wigan, Bolton, and Rotherham. The 2,631 fatal cases of diarrhoea corresponded to an annual rate of 0.60 per 1,000; the rate in London was 0.46 per 1,000, while it averaged 0.67 in the seventy-five other large towns, among which diarrhoea was proportionally most fatal in Grimsby, Burnley, Blackburn, Preston, Rotherham, Middlesbrough, and Tynemouth.

Infant mortality, measured by the proportion of deaths among children under 1 year of age to registered births, was equal to 146 per 1,000 last quarter, against 134, 135, and 154 in the corresponding quarters of the three preceding years. In London the rate of infant mortality in the quarter under notice was 123 per 1,000, while it averaged 155 in the seventy-five other large towns, and ranged from 48 in Huddersfield, 60 in Hastings, 83 in Leyton and in Bournemouth, 86 in King's Norton, and 93 in Northampton, to 215 in Stockport, 214 in Burnley, 219 in Blackburn, 223 in Rotherham, 226 in Rochdale, and 236 in Preston.

The causes of 0.9 per cent. of the deaths not certified either by a registered medical practitioner or by a coroner. All the causes of death were fully certified in Croydon, Hornsey, Tottenham, East Ham, Walthamstow, Brighton, Southampton, Ipswich, Great Yarmouth, Plymouth, Devonport, Derby, Stockport, Wigan, Leeds, York, West Hartlepool, Cardiff and Swansea; among the other towns the proportion per cent. ranged upwards to 5.0 in West Bromwich, 3.4 in Bootle, 3.9 in Birmingham, 4.8 in Warrington, 4.3 in King's Norton, 4.8 in South Shields, 5.3 in Barrow-in-Furness, and 5.7 in Gateshead.

HEALTH OF ENGLISH TOWNS.

IN seventy-six of the largest English towns, including London, 8,449 births and 5,835 deaths were registered during the week ending Saturday last, February 6th. The annual rate of mortality in these towns, which had been 15.7 and 18.0 per 1,000 in the two preceding weeks, further rose last week to 18.7 per 1,000. The rates in the several towns ranged from 6.9 in Devonport, 8.8 in Walthamstow, 9.2 in Hastings, 10.9 in Hornsey, 11.2 in Huddersfield, 12.1 in East Ham, 12.6 in Handsworth (Staffs), 12.8 in Rotherham, and 12.9 in Grimsby, to 19.6 in Northampton, 22.7 in Croydon, 22.9 in Bradford, 23.5 in Salford, 25.5 in Hanley, 24.0 in Bootle, 24.6 in Manchester, and 25.3 in Middlesbrough. In London the rate of mortality was 20.3 per 1,000, while it averaged 18.2 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.6 per 1,000 in the seventy-six towns; in London this death-rate was equal to 1.5 per 1,000, while among the seventy-five other large towns the death-rates from these principal infectious diseases ranged upwards to 3.0 in Manchester, 2.3 in St. Helens, 3.5 in Birmingham, 4.4 in Smethwick, 6.4 in Middlesbrough, and 7.2 in Warrington. Measles caused a death-rate of 1.1 in St. Helens and in Middlesbrough, 1.2 in King's Norton and in Manchester, 1.6 in Sheffield and in Rotherham, 1.7 in Leicester, 1.8 in West Ham, 1.9 in Birmingham, 2.6 in West Hartlepool, 3.7 in Smethwick, 5.4 in Middlesbrough, and 5.8 in Warrington; diphtheria of 1.2 in Derby; whooping-cough of 1.1 in St. Helens and 2.1 in Swansea; "fever" of 1.1 in Salford; and diarrhoea of 1.3 in Southampton and 1.5 in Warrington. The mortality from scarlet fever showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospital and the London Fever Hospital, which had been 3,261, 3,211, and 3,201 at the end of the three preceding weeks, had further fallen to 3,117 at the end of last week; 312 new cases were admitted during the week, against 358, 379, and 359 in the three preceding weeks. One case of small-pox was admitted and remained under treatment at the end of the week.

HEALTH OF SCOTTISH TOWNS.

DURING the week ended Saturday last, February 6th, 869 births and 484 deaths were registered in the principal Scottish towns. The annual rate of mortality in these towns, which had been 18.8 and 19.1 per 1,000 in the two preceding weeks, rose again to 18.5 per 1,000 last week, but was 0.2 below the mean rate during the same period in the twenty-six large English towns. Among these Scottish towns the death-rates ranged from 14.6 in Leith and Aberdeen, to 20.1 in Aberdeen and 25.9 in Dundee. The death-rate from the principal infectious diseases averaged 2.2 per 1,000, the highest rates being recorded in Glasgow and Aberdeen. The 300 deaths registered in Glasgow included 2 which were referred to scarlet fever, 1 to diphtheria, 35 to whooping-cough, 2 to cerebro-spinal meningitis, and 9 to diarrhoea. Three fatal cases of whooping-cough were recorded in Edinburgh; 2 of diphtheria in Dundee; 2 of whooping-cough in Paisley; and 2 of measles, 2 of diphtheria, 3 of whooping-cough, and 2 of diarrhoea in Aberdeen.

HEALTH OF IRISH TOWNS.

DURING the week ended Saturday, February 6th, 618 birth and 454 deaths were registered in the twenty-two principal urban districts of Ireland, as against 730 births and 492 deaths in the preceding period. The annual rate of mortality in these districts, which had been 21.6 and 21.5 per 1,000 in the three preceding weeks, fell to 20.7 per 1,000 in the week under notice, this figure being 2.0 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 24.5 and 17.5 respectively, those in other districts ranging from 7.8 in Galway and 9.7 in Waterford to 38.4 in Sligo and 40.1 in Newtownards, while Cork stood at 26.0, Londonderry at 15.7, and Limerick at 15.7. The zymotic death-rate in the twenty-two districts averaged 1.0 per 1,000, as against 1.4 per 1,000 in the preceding period.

Hospitals and Asylums.

EAST SUSSEX ASYLUM, HELLINGLY.

THE annual report for the year 1907 of Dr. F. R. P. Taylor, the medical superintendent of this asylum, shows that on January 1st, 1907, there were 1,104 patients on the asylum registers, and that on the last day of the year there remained 978. The total cases under care during the year numbered 1,367, and the average numbers daily resident 1,085. During the year 263 were admitted, of whom 241 were direct and 22 indirect admissions or transfers. The attacks were first attacks in 146, not-first attacks in 69, unknown whether first attack or not in 16, and 31 were congenital cases. In 85 of the direct admissions the attacks were first attacks within three, and in 27 more within twelve months of admission, and of the not-first attack cases, in 18 the illness was of less than three months' duration, and in 11 more within twelve months of admission. Thus, in 138 of the 241 direct admissions the illness was of recent origin on admission. The direct admissions were classified according to the several forms of mental disorder into: Mania of all kinds, 78; melancholia of all kinds, 67; senile and secondary dementia, 27; delusional insanity, 12; general paralysis, 7; insanity with epilepsy, 12; insanity with gross brain lesions, 5; confusional insanity and stupor, 2 each; primary dementia and not insane, 1 each; and congenital or infantile mental defect, 29. The small proportion of general paralytics admitted (under 4 per cent.), is unusual. As to the probable etiological factors in the direct admissions, alcohol was assigned in 19 (or 7.9 per cent.), syphilis in 4, epilepsy in 26, critical periods in 93 (old age in 42), various bodily affections in 8, congenital defect not amounting to imbecility in 7, and mental stress in 18. An insane heredity was ascertained in 83, or 35.6 per cent.; an epileptic heredity in 13, and an alcoholic heredity in 10. As a matter of fact, however, reliable histories could only be obtained in 177 of the direct admissions, and gave a proportion of hereditary influences of 58.5 per cent. in these cases. During the year 91 were discharged as recovered, giving a recovery-rate on the direct admissions of 37.7 per cent., or of recoveries in direct admissions on direct admissions of 32.3 per cent. There were also 23 discharged as relieved, and 176 as not improved, the large numbers so discharged, ensuing upon the termination of the contract with the London Asylums Committee, accounting for the decrease in the number of the patients in the asylum at the end of the year. During the year also 98 died, giving a death-rate on the average numbers resident of 9.01 per cent. All deaths were due to natural causes. To phthisis 13 deaths were due, and there were also 6 deaths from other forms of tuberculosis; 15 died from general paralysis, 19 from senile decay, 2 from senile fever, and 3 from dysentery, the remaining causes of death offering no point of special interest. Dysentery, Dr. Taylor says, appears to be gradually dying out at this asylum, and with the exception of a slight epidemic of enteric fever, confined to the female side and attacking 6 patients in all, the patients were free from zymotic disease. Five inquests were held during the year, in all cases no blame attaching to the asylum staff, and no serious casualty occurred.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column, advertisements must be received not later than the first post on Wednesday morning.

VACANCIES.

- BATH ROYAL UNITED HOSPITAL.—House-Physician. Salary, £80 per annum.
- BIRKENHEAD UNION.—Resident Male Medical Officer for the Infirmary and Sanatorium. Salary, £100 per annum.
- BIRMINGHAM AND MIDLAND HOSPITAL FOR SKIN AND VEGETABLE DISEASES.—Clinical Assistant. Honorarium at the rate of 52 guineas per annum.
- BIRMINGHAM GENERAL HOSPITAL.—(1) House-Surgeon. (2) Two Assistant House-Surgeons. Salary at the rate of £50 and £40 per annum respectively.
- BRADFORD ROYAL INFIRMARY.—(1) Two House-Surgeons. (2) House-Physician. £100 per annum each.
- BRISTOL COSHAM MEMORIAL HOSPITAL, Kingswood.—House-Surgeon. Salary, £50 per annum.
- BRISTOL ROYAL INFIRMARY.—Resident Casualty Officer. Salary at the rate of £50 per annum.
- BRIXTON DISPENSARY.—Resident Medical Officer. Salary, £150 per annum.
- CHESTERFIELD AND NORTH DERBYSHIRE HOSPITAL.—Junior House-Surgeon. Salary, £50 per annum.
- COLCHESTER ESSEX COUNTY HOSPITAL.—House-Surgeon. Salary, £80 per annum.
- DERBY COUNTY ASYLUM, Mickleover.—Junior Assistant Medical Officer male. Salary, £120, rising to £150 per annum.
- DEVONPORT ROYAL ALBERT HOSPITAL AND EYE INFIRMARY.—Assistant Resident Medical Officer. Salary at the rate of £50 per annum.
- DURHAM COUNTY ASYLUM.—Junior Assistant Medical Officer. Salary, £120, rising to £150 per annum.
- GLASGOW LUNACY BOARD.—Assistant Medical Officer at the Mental Hospital, Woodilee. Salary to begin, £125 per annum.

HALIFAX: HALIFAX ROYAL INFIRMARY.—Third House-Surgeon. Salary, £80 per annum.
HOSPITAL FOR DISEASES OF THE SKIN, Stamford Street, S.E. —(1) Assistant Physician. (2) Assistant Surgeon.
KIDDERMINSTER INFIRMARY AND CHILDREN'S HOSPITAL.—House-Surgeon. Salary, £100 per annum.
KING'S COLLEGE HOSPITAL.—Assistant Clinical Pathologist.
LEIPSTER INFIRMARY.—House-Physician. Salary at the rate of £100 per annum.
LIVERPOOL DAVID LEWIS NORTHERN HOSPITAL.—House-Surgeon. Salary at the rate of £60 per annum.
LONDON HOSPITAL, Whitechapel, E.—Medical Registrar. Salary, £100 per annum.
LONDON THROAT HOSPITAL, Great Portland Street, W.—Assistant Surgeon.
MANCHESTER CHILDREN'S HOSPITAL.—Male Resident Medical Officer. Salary, £40 first six months, £50 second six months.
MANCHESTER CORPORATION.—Assistant Medical Officer at the Bache Sanatorium. Salary at the rate of £100 per annum.
MANCHESTER: ST. MARY'S HOSPITALS FOR WOMEN AND CHILDREN.—Male and Female House-Surgeons. Honorarium, £25 for six months each.
MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, Chancery Street, W.C.—Medical Superintendent. Salary, £100 per annum.
MELROSE: ROXBURGH DISTRICT ASYLUM.—Assistant Medical Officer. Salary, £150 per annum.
NEW HOSPITAL FOR WOMEN, Euston Road, N.W.—Clinical Assistant for the Out-patient Department.
PLAISTOW: ST. MARY'S HOSPITAL FOR WOMEN AND CHILDREN.—Assistant Resident Medical Officer. Salary at the rate of £80 per annum.
QUEENSLAND GOVERNMENT.—Assistant Medical Superintendent of the Lunatic Asylum, Toowoomba. Salary, £400 per annum.
ST. PANCRAS AND NORTHERN DISPENSARY, Euston Road, N.W.—Resident Medical Officer. Salary, £100 per annum.
ST. PETER'S HOSPITAL FOR STONE AND OTHER URINARY DISEASES, Henrietta Street, W.C.—(1) Assistant Surgeon. (2) Junior House-Surgeon. Salary at the rate of £50 per annum.
SHREWSBURY: SALOP INFIRMARY.—House-Surgeon. Salary, £100 per annum.
SOMERSET AND BATH ASYLUM, Wells.—Second Assistant Medical Officer. Salary, £130, rising to £150 per annum.
STROUD GENERAL HOSPITAL.—House-Surgeon. Salary, £100 per annum.
WESTERN COUNTIES ASYLUM, Starcross, Devon.—Medical Officer. Salary, £150 per annum.
WESTERN GENERAL DISPENSARY, Marylebone Road, N.W.—Honorary Ophthalmic Surgeon.
WEST LONDON HOSPITAL, Hammersmith Road, W.—(1) Two House-Physicians. (2) Three House-Surgeons.
VENTNOR ROYAL NATIONAL HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST.—Male Assistant Resident Medical Officer. Salary, £100 per annum.

APPOINTMENTS.

BADDEROW, George W., M.B., M.R.C.S.Eng., Assistant Surgeon to the Hospital for Diseases of the Throat, Golden Square, W.
BIRD, Gerald F., M.B. Cantab., Medical Officer and Public Vaccinator to the Godalming District of the Guildford Union.
DAVID, A. S., M.R.C.S., L.R.C.P., District Medical Officer of the Chertseyton Union.
ELLERTON, H. Byam, M.R.C.S.Eng., L.R.C.P.Lond., Inspector of Asylums in Queensland, and Medical Superintendent of the Goodna Asylum, near Brisbane.
GARDEN, W. S., M.B., B.S. Aberd., Medical Officer of Health, Horbury Urban District.
HILLYER, W. H., M.D. Durh., District and Workhouse Medical Officer of the East Grinstead Union.
HUNTER, J. W. M., L.R.C.P. and S. Edin., District Medical Officer of the Basford Union.
MORE, J., L.R.C.P., M.R.C.S., Medical Officer of Health of the Rothwell Urban District.
READE, A. G., L.R.C.S.Eng., L.R.C.P.Lond., Senior Assistant Medical Officer to the new Metropolitan Asylums Board's Children's Infirmary, Carshalton, Surrey.
ROBERTSON, O. H., L.S.A., District Medical Officer of the Southwell Union.
WATERFIELD, W. H., L.R.C.P. and S. Irell, District and Workhouse Medical Officer of East Stonehouse Parish.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 3s. 6d., which sum should be forwarded in post-office orders or stamps with the notice not later than Wednesday morning, in order to ensure insertion in the current issue.

BIRTH.

WILLIAMS.—On February 7th, at Hendre, Wrexham, the wife of R. Geoffrey Williams, of a daughter.

DEATH.

KEY.—At Roodepoort, Transvaal, on February 2nd, Dr. James Miln Key, eldest son of Dr. Andrew Key, Montrose, aged 41. (By cable.)

BOOKS, ETC., RECEIVED.

London: W. B. Saunders and Co. 1908:
 A Reference Handbook of Gynaecology for Nurses. By C. Macfarlane, M.D. 6s.
 Surgery: Its Principles and Practice. By Various Authors. Edited by W. W. Keen, M.D., LL.D., and J. C. De Castro. Vol. IV. 3s.
 Sour Milk and Pure Cultures of Lactic Acid Bacilli in the Treatment of Disease. By G. Hershbell, M.D. London: H. J. Glaisner, 1909. 1s. 6d.

DIARY FOR THE WEEK.

MONDAY.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C., 4 p.m.—Hunnician Oration by the President, Mr. Henry Morris.

TUESDAY.

CHELSEA CLINICAL SOCIETY, Chelsea Dispensary, Manor Street, Chelsea, S.W., 8.30 p.m.—Communications:—Dr. Alfred Edlowes: On Rupture, and the Treatment of Corns and Plantar Warts. Dr. Victor Bonney: Some useful Prescriptions in the Practice of Gynaecology (illustrated by lantern slides).

ROYAL SOCIETY OF MEDICINE:

PATHOLOGICAL SECTION, 20, Hanover Square, W., 8.30 p.m.—Paper:—Dr. M. Greenwood, Jull: The Limits of Significance of the Opsonic Index. The following will speak: Colonel Leishman, Dr. Ledingham, Dr. Eyre, and Mr. Goadby.

THURSDAY.

HARVEIAN SOCIETY OF LONDON, Stafford Rooms, Tichborne Street, W., 8.30 p.m.—Papers:—Dr. E. Graham Little: The Treatment of Skin Diseases by Ionization. Dr. F. S. Languead: Infant Feeding with Undiluted Curd Milk.

ROYAL SOCIETY OF MEDICINE:

DERMATOLOGICAL SECTION, 20, Hanover Square, W., 5 p.m.—Clinical Cases:—Dr. MacLeod: A Case of Lupus Erythematosus treated by Zinc Ionization; and other cases.

FRIDAY.

ROYAL SOCIETY OF MEDICINE:

ELECTRO-THERAPEUTICAL SECTION, 20, Hanover Square, W., 8.30 p.m.—Dr. C. Thurstan Holland: The X-ray Treatment of Exophthalmic Goitre. Dr. A. Stanley Green: The Value of Roentgen Examination in some Conditions of Diseased Bone. Dr. A. Howard Price: Treatment of Tuberculous Glands in Neck by means of X Rays.

SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 11, Chandos Street, Cavendish Square, London, W., 8.30 p.m.—Dr. H. G. Waters: A New Pathogenic Spirochaete Associated with Bronchitis. Dr. T. Fausset Macdonald: Tropical Notes from Barbados.

POST-GRADUATE COURSES AND LECTURES.

LONDON SCHOOL OF CLINICAL MEDICINE.—Daily arrangements: Out-patient Demonstrations, 10 a.m.: Medical and Surgical Clinics, 2.15 p.m. and 3.15 p.m. respectively; Operations, 2 p.m., Special Clinics: Ear, Throat, and Nose, and 4 p.m., Monday, and Tuesday; Thursday: Skin, and 4 p.m., Tuesday, and noon, Friday; Eye, 11 a.m., Wednesday and Saturday; Radiography, 4 p.m., Thursday. Special Lectures: Monday, 3.15 p.m., Some Common Rectal Complaints. Tuesday, 2.15 p.m., Aortic Disease.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chancery Street, W.C.—The following clinical demonstrations have been arranged for next week, 1909: Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday. 4 p.m., each day: Monday, Skin. Tuesday, Medical. Wednesday, Surgical. Thursday, Surgical. Friday, Eye. Lectures at 5.15 p.m. each day will be given as follows: Monday, The Diagnosis and Surgical Treatment of Duodenal Ulcer. Tuesday, The Situations and Diagnosis of Obsolete Fractures. Wednesday, The Treatment of Syphilis. Thursday, The Treatment of the Falling Heart.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.—Tuesday, 3.30 p.m., Surgery of the Nervous System. Friday, 3.30 p.m., The Treatment of Sciatica and Allied Affections.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.—Monday, Clinics, 10 a.m., Surgical Out-patient, 2.30 p.m., Medical Out-patient: Nose, Throat and Ear; X Rays; 4.30 p.m., Medical In-patient. Tuesday, 10 a.m., Medical Out-patient Clinic; 2.30 p.m., Operations; Clinics: Surgical Gynaecological; 4.30 p.m., Lantern Lecture, Tumours of the Female Breast. Wednesday, 2.30 p.m., Medical Out-patient, Skin, and Eye and Throat. Thursday, 2.30 p.m., Gynaecological Operations; Clinics: Medical Out-patient, Surgical Out-patient, X Rays; 3 p.m., Medical In-patient; 4.30 p.m., Lecture, The Diagnosis and Treatment of Fractures. Friday, Clinic; 10 a.m., Surgical Out-patient; 2.30 p.m., Operations; Clinics: Medical Out-patient, Eye; 3 p.m., Medical In-patient.

POST-GRADUATE COLLEGE, WEST LONDON HOSPITAL, Hammersmith Road, W.—The following are the arrangements for next week:—Daily, 2 p.m., Medical and Surgical Clinics; X Rays. 2.30 p.m., Operations, Monday and Thursday, and Wednesday and Saturday, 2 p.m.: Diseases of the Eyes. Tuesday and Friday, 10 a.m., Gynaecological Operations. 2 p.m., Monday and Wednesday, and 10 a.m., Tuesday and Wednesday, 10 a.m.: Diseases of Throat, Nose, and Ear; 2.30 p.m., Diseases of the Skin. Wednesday and Saturday, 10 a.m.: Diseases of Children; 2.30 p.m., Diseases of Women. Lectures: At 12 noon, Monday. Pathological Demonstration. At 10 a.m., Monday and Thursday, Surgical Registrar. Demonstration of Surgical Cases in Wards. Friday, Medical Registrar. Demonstration of Cases in Medical Wards. At 12.15 p.m., Wednesday and Saturday, Practical Medicine. At 5 p.m., Monday, Sleeping Sickness. Tuesday, Gynaecology. Wednesday, Practical Surgery. Thursday, Clinical Lectures. At 12 noon, Friday, Some Clinical Observations on Heart Disease.

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, Leicester Square, W.C., Thursday, 6 p.m., Syphilis as it Modifies other Eruptions of the Skin.

MARCH.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

THE British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the BRITISH MEDICAL JOURNAL is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association, and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the BRITISH MEDICAL JOURNAL for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BIRMINGHAM BRANCH.

An ordinary meeting was held on February 11th at the Medical Institute. Mr. F. MARSH, President, was in the chair, and twenty-five members were present.

The Association and the Midwives Board.—Dr. KIRBY moved, Sir JAMES SAWYER seconded, and it was carried unanimously:

That this meeting of the Birmingham Branch urges on the Central Council the desirability of approaching the Departmental Committee, now sitting to consider the working of the Midwives Act, with a request for direct representation of the British Medical Association on the Midwives Board.

Stenosis of Stomach and Intestine.—Mr. LEEDHAM-GREEN showed a young man who had been the subject of a series of abdominal operations for the relief of stenosis of the stomach and intestine. The first operation took place seven years ago, when another surgeon performed an anterior gastro-jejunostomy. This was effected by the use of a medium-sized Murphy's button, which was not subsequently passed. Two years later a perforated ulcer of the jejunum gave rise to a localized peritonitis, which necessitated the opening and draining of an abscess. Four months later another ulcer of the jejunum perforated, and gave rise to extensive peritonitis, which was relieved by a third operation. Early in 1908 the patient was operated upon by Mr. Leedham-Green for the relief of chronic intestinal obstruction due to adhesion of a portion of the small intestine to the anterior abdominal wall. As it was not feasible either to liberate the adhesions or excise the affected gut, on account of the greatly enfeebled condition of the patient, the obstruction was overcome by short-circuiting the bowel, with immediate relief to the patient. Early in this year, however, symptoms of mechanical obstruction again developed, and on opening the abdomen it was found that a coil of small intestine had slipped through the anastomotic loop, and so given rise to the obstruction. To prevent this recurring the affected bowel was liberated from its adhesions and about 2 ft. of the intestine excised. At the same time the opening between the stomach and jejunum was considerably enlarged, as it was found to have contracted to a size

barely admitting the tip of the little finger. From the stomach the corroded Murphy button was removed, which had been lying there for nearly seven years. The patient made an excellent recovery and is rapidly increasing in weight.

Angio-lipoma.—Mr. VICTOR MILWARD showed a child, aged 8 months, on whom he had operated in November, 1908, for an angio-lipoma the size of a small orange, involving the left parotid gland. At the commencement of the operation the left external carotid artery was ligatured and the growth was then removed without any serious amount of haemorrhage. The branches of the facial nerve ran through the tumour, and with much care they were preserved in continuity. Left facial paralysis was complete after the operation, but had by now almost entirely disappeared. The child was well and strong, and no tendency to recurrence had as yet shown itself. Mr. Milward drew attention to the value of ligature of the external carotid prior to removing large vascular growths of the face, especially in children, where loss of blood is badly stood.

Large Gall Stone.—Mr. ALBERT LUCAS showed a gall stone measuring over 1½ in. by 1 in. and weighing 180 grains, which he had successfully removed from the upper part of the jejunum of a man aged 57. The patient had suffered from complete obstruction for four days, and was in very great pain. The abdomen was concave; there was no history of jaundice or gall stones. He had had a somewhat similar attack two years previously.

Treatment of Neuralgia.—Dr. SIMON read a paper on some points in the treatment of neuralgia, in which he laid stress on the following points: In all cases pressure on the nerve elements is the cause of pain. Pressure may arise from changes outside or inside the nerve sheath. Treatment must be directed to the nerve sheath. Several illustrative cases were reported. Dr. DARIY WESTON, Dr. CODD, and Mr. J. FURNEAUX JORDAN discussed the paper; and Dr. SIMON replied.

EDINBURGH BRANCH: SOUTHERN DIVISION.

A MEETING of the Division was held in the Oddfellows' Hall, Forrest Road, on Friday, February 5th, at 8.15 p.m. Dr. MATHESON was in the chair, and there were present Drs. Walker, Proudfoot, Scott, Veitch, S. Paterson, Kennedy, E. Price, Porter, Jamieson, Webster, Cumming, Cullen, Allan, Meikle, Edington, and the Secretary.

Confirmation of Minutes.—The minutes were read, approved, and signed.

Report of Executive Committee.—The annual report of the Executive Committee was submitted, in which details of the number of members, the number of medical practitioners in the Division, the finance of the Division, the meetings of the Division and Executive Committee, and a summary of the work undertaken by the Division during the past year were given. The report was approved and a vote of thanks accorded the Secretary for his services.

The Draft Charter.—The report of the Organization Committee on opposition to certain clauses of the draft Charter, with counsel's opinion thereon, was put before the meeting, and Dr. WALKER contributed a few remarks on the subject.

Certificates from Hospitals.—A communication from the Hospitals Committee re "Certificates from Hospitals" was read, and the SECRETARY reported the answers which had been received from the various hospitals in the Division, and which had been transmitted to the Medical Secretary. A question arose, and was freely discussed, regarding the right of insurance companies employing their own medical referees to examine and certify cases under the Workmen's Compensation Act in hospitals.

Medical Officers of Health and Private Practice.—The report and memorandum on public health officers referred to Divisions was submitted. The proposition that "Medical officers of health should be debarred from engaging in private practice" was unanimously agreed to, with the reservation that the needs of thinly-populated rural districts should be safeguarded by proper arrangements for combination.

Hospital Isolation of Infectious Diseases.—A discussion on hospital isolation of infectious diseases was opened by Dr. KENNEDY with an interesting paper in favour of isolation. Owing to the short time at his disposal, he confined his remarks more especially to the advantages which had followed hospital isolation of scarlet fever. The debate was taken part in by Drs. MATHESON, CULLEN, WALKER, PORTER, EDINGTON, and CUMMING. Dr. KENNEDY replied.

The Notification of Phthisis.—The subject of the advantages and disadvantages of the notification and isolation of pulmonary tuberculosis was chosen for discussion at the next meeting, to be opened by Dr. E. PRICE.

Vote of Thanks.—A vote of thanks to the Chairman closed the meeting.

METROPOLITAN COUNTIES BRANCH:

RICHMOND DIVISION.

A MEETING of this Division was held at the Royal Hospital, Richmond, on Wednesday, February 10th.

Paper.—Mr. E. CANNY RYALL read an interesting paper on spinal analgesia, illustrated with diagrams. The paper had reference chiefly to the technique of the operation, and, after discussion, Mr. Canny Ryall replied, and was thanked for his valuable paper.

SOUTH MIDLAND BRANCH:

BEDFORD AND HERTS DIVISION.

An ordinary general meeting of the Division was held at the County Hospital, Bedford, at 3 p.m. on Thursday, February 11th, Dr. G. F. DIXON in the chair. There were also present Dr. J. W. Bone (Vice-Chairman), Drs. Best, Birks, Bower, Butters, Chillingworth, Coombs, Emerson, Goldsmith, Hartley, Leighton, Lipscomb, Nash, Stacey, and the Honorary Secretary.

Confirmation of Minutes.—The minutes of the last meeting were read and signed.

Transference of Leighton Buzzard to Buckinghamshire Division.—A letter was read from Dr. A. E. Larking, of Buckingham, asking the consent of the Division to the transference of Leighton Buzzard to the newly-formed Buckinghamshire Division. After some discussion it was agreed that the Division consents to the transference.

Whole-time Medical Officers of Health.—A letter was read from the Public Health Committee on the subject of whole-time medical officers of health. The following resolution was put to the meeting and carried:

That it is highly desirable that medical officers of health should be whole-time appointments, and that their highly specialized work should be adequately remunerated combined with security of tenure.

Earlier Appointment of Representatives.—A letter from the Medical Secretary on this subject was read, and it was decided to refer the matter for consideration at the next annual meeting of the Division.

Medical Inspection of School Children.—The meeting then considered the report of the Medico-Political Committee on the medical inspection and treatment of school children. After a lengthy discussion the questions on page 11 of the report were answered as follows: Question 1 (a), Does the Division approve of the system of payment per head? was answered in the negative. Questions (b) and (c) therefore require no answer. Question (d), Does the Division suggest any other method of payment? was answered thus: The Division suggests that payment be by fixed salary. Regarding the treatment of school children, it was unanimously resolved that the Division does not approve of school clinics, but would recommend that the surgeries of all the practitioners in the area should be available for the treatment of those children found defective, payment to be made by voucher paid by the Education Authority at a fixed scale. Concerning the last question of the report, No. 4, page 11, the Division does not express any views. This concluded the business of the meeting.

SOUTH WALES AND MONMOUTHSHIRE BRANCH:

MONMOUTHSHIRE DIVISION.

A SPECIAL meeting of this Division was held on January 29th; the CHAIRMAN (Dr. W. F. Nelis) presided, and nineteen members were present.

Medical Inspection and Treatment of School Children.—The report of the Medico-Political Committee re certain points in connexion with the medical inspection of school children and the treatment of those found defective was considered, and after a prolonged discussion the following resolutions were passed:

1. That the system of whole-time medical inspectors of schools in vogue in the county of Monmouth and the borough of Newport is satisfactory.
2. That the Division does not approve of the system of payment per head.
3. That the Division disapproves of the formation of school clinics.
4. That the Division approves of the proposals of Dr. A. H. Williams, of Watford and Harrow, with alterations so as to read as follows:
The medical inspector reports a child as defective.
The parent is to be notified that the defect is to be attended to at once.

Should the parents be unable to pay for treatment, then the Education Authority is to give a voucher for the payment of the fee on a fixed scale.

The parent may then take his child to any practitioner whom he may select, and the practitioner will receive his fee from the Education Authority.

It was further resolved that provision ought to be made at the expense of the Education Authority for cases requiring special treatment.

ULSTER BRANCH.

THE winter meeting of this Branch was held in the Medical Institute, Belfast, on Wednesday, February 3rd, Dr. ALEX. DEMPSEY, President, in the chair.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Apologies for Absence.—Apologies for absence were read from Dr. Thos. McLaughlin (Londonderry) and Dr. H. B. Murray (Belfast).

Report of Council.—THE HONORARY SECRETARY (Dr. Cecil Shaw) read the report of Council. Two meetings of Council had been held since the last meeting of the Branch. The following new members had been elected: Drs. Wm. Gibson, Robt. McDowell, Robt. Wilson, C. G. Lowry, J. S. Dickie, R. Johnston, Joseph Martin, Mark Cahill, G. F. Campbell, T. C. Cathcart, R. G. Clements, E. B. Flanagan, D. J. McKinney, John McLeish, Robt. May, Brian O'Brien, W. L. Storey, T. S. S. Holmes, J. L. Sinton, Boylan Ewing, and Arthur H. Joy, all of Belfast; Caroline Crawford (Lurgan), Aird and Moore (Bangor), Martin (Banbridge), T. H. May (Bunbeg, co. Donegal), R. T. Herron (Armagh), M. J. Nolan (Downpatrick), A. K. Stevenson (Ballyclare), and Currie (Ballymena).

Cases.—Mr. HANNA showed a case of *Traumatic cataract* in which a piece of metal was found in the lens when removed, though no history of its entry was obtained.

Dr. CALWELL showed a case of the premycotic stage of *Mycosis fungoides*. Dr. W. M. KILLEN showed a case in which he had operated for extradural abscess, and in which the jugular vein was subsequently tied by Professor Sinclair for commencing thrombosis of the lateral sinus. Dr. CECIL SHAW showed: (1) A case of a pit or *Crypt* in the side of the optic disc; (2) a case of supposed *Rhinocleroma* affecting the tongue, pharynx, and larynx. Mr. ROBERT CAMPBELL showed a child with a *Large tumour in the axilla*. Mr. R. J. JOHNSTONE showed a specimen of strangulated ovarian cyst complicating pregnancy, and also a specimen of strangulated small intestine due to volvulus, successfully excised, and read notes on a case of chronic inversion of the uterus. Dr. DARLING and Mr. ROBERT CAMPBELL discussed the cases. Dr. JOHN CAMPBELL showed a convenient form of sterilizer and case for carrying instruments. He had had this made to his own design, for carrying all the instruments and dressings usually needed for an abdominal section. It was made of tin, with a double coat, so that it could be filled with water and boiled on a kitchen range without disturbing the instruments arranged ready for use in various compartments. Dr. CALWELL described a method for the clinical estimation of rennin in the stomach contents. The value of the estimation was discussed by Professor LINDSAY and Dr. CLEMENTS.

Renal Calculi.—Mr. FULLERTON showed some renal calculi removed by nephrolithotomy, and showed a skiagraph showing the ureteral catheters in position. He said that in one case the only symptom was haematuria; in another pyuria was the sole cause of the patient seeking advice; in a third the patient had pain without blood or pus; and in the remainder the accepted signs and symptoms of stone were present. The calculi, as regards their chemical composition, did not follow the generally accepted rule. Most textbooks stated that oxalate calculi were rare as compared with uric acid and phosphatic, but in this series, small it was true, the first-mentioned predominated.

(1) The first case was that of a man, aged 35, who had had two fairly severe attacks of haematuria, one of which lasted on and off for nearly a year, during part of which he was in the Royal Victoria Hospital. A cystoscopic examination was not then made, and he went out without a diagnosis having been made. On the second occasion he was again in the same institution, and this time he was examined with the cystoscope. Blood was seen to issue in vigorous jets from the left ureter. He had no other symptom whatever. Mr. Fullerton removed a small, minute oxalate of calcium spicule from the kidney, with complete relief of the symptoms. The calculus was so small that it was all used up in testing its composition, so that he was unable to show it. (2) The second case was a medical man who had been complaining of pain in the right kidney region, going down into the region of the hip but not to the testis. He had occasional attacks of haematuria, which came on after violent exercise like tennis. During these attacks he noticed in the kidney region was worse. He had intervals of complete freedom. The orifices of the ureters were normal as seen by the cystoscope, and, as the patient was not then bleeding, the colour of the effluxes was normal. The jets were, however, somewhat irregular on the right side, both as regards quantity and rhythm, while on the opposite side the jets were emitted with clockwork regularity. The ureteral catheter showed that the right-sided effluent contained a trace of mucus and a small quantity of albumen. A few days later Mr. Fullerton removed the small oxalate calculus, which he showed from the right kidney pelvis. He heard at intervals from his friend, who, he was glad to say, kept in excellent health. In this case the x rays failed to discover the stone, probably from its small size. (3) The third case was that of a doctor's wife, who had been complaining for over a year of attacks of pain beginning in the left renal region and extending down to the groin, along the outer side of the thigh, and down the leg as far as the great toe. She had a movable kidney on the right side. During these attacks the patient vomited, but the urine always remained clear. Her husband made repeated examinations for blood, with a negative result. The difficulty in this case was the movable kidney, and also the fact that pressure on the left side produced pain, not on that side, but on the opposite side, radiating down to the groin. There were in some doubt which side to explore, and as the x rays gave no assistance, Mr. Fullerton tried catheterization of the ureters. The effluxes from the left side were more numerous than on the right, and the specimens from the two sides gave further valuable information. The specimen from the left side was clear like water, specific gravity less than 1005, and contained a fair quantity of albumen. That on the right was of the ordinary colour, specific gravity 1015, and contained only a trace of albumen. Acting on this hint, Mr. Fullerton explored the left kidney, and removed from its pelvis a small calculus, again composed of oxalates. Recovery was uneventful, and the renal colic has not reappeared. (4) The fourth case was that of a young

man aged 29, who had had frequent attacks of renal colic on the right side, the pain extending into the testicle of the same side. He also complained of frequency of micturition during these attacks, and contained a fair quantity of albumen and a little blood. The skiagrams were not satisfactory, so Mr. Fullerton examined him in the usual way with the cystoscope. The ureteral orifice of the right side was dilated and congested, and emitted urine at more frequent intervals than on the left. The specific gravity of the urine on the right was 1010 as against 1015 on the left. In addition, there was a fair quantity of albumen, and a little blood on the right side, while the left side emitted only a trace of albumen and no blood. Mr. Fullerton removed a large calculus, once more an oxalate of lime one with sharp spicules, from the right kidney pelvis. Up to the present he had removed all calculi through the cortex of the kidney, but he was prepared to admit that direct access through the pelvis itself might prove to be the better way. The patient made a good recovery, and remained free from pain. The stone weighed 3 grains. The fifth case was that of a lad, aged 18, who had had frequent attacks of renal pain on the right side, beginning in the lumbar region and extending to the front of the abdomen and finally to the testicle. He had no frequency of micturition, and Dr. McLeish, under whose care he was, says that, except for a suspicion of albumen on one occasion, he always found the urine normal. There was never any blood or pus. Cystoscopic examination and catheterization of the ureters gave no assistance. He then decided to try the effect of chromocystoscopy and injected 2 grains of indigo carmine in the gluteal muscles. In about fifteen minutes the blue colour began to appear on the left or presumably healthy side, while on the side of the pain the colour did not appear until twenty minutes later. In addition, the jets from the painful side were much less frequent, the intervals being as much as two minutes at first. Acting on this information, Mr. Fullerton explored the painful kidney. The most careful search failed to discover any stone, although he brought the organ out on to the loin and almost bisected it. He felt nothing in following the ureter down with his finger as far as he could reach through a fairly large incision. Finally, he passed a long ureteral catheter right into the bladder. On drawing it out the stone was by a rare stroke of fortune pulled into an accessible position and easily removed. It was of the very small size and was completely black the ureter. It was composed chiefly of uric acid. He examined the boy's bladder about a month after the operation, having previously injected indigo carmine, to ascertain the condition of the kidney which had been dealt with in the way mentioned. The organ had evidently resumed its *status quo ante*, as the blue colour appeared in the same time as at the last examination. He noticed that at the operation the stone was small in size. This might have accounted for the delay in the appearance of the coloured material in the urine. (6) The sixth case of nephrolithotomy was in a man aged 40 who had almost daily attacks of typical renal colic, but without blood. On examining his bladder with the cystoscope, the left ureteral orifice was seen to be dilated and oedematous in the vicinity, and radiated into irregular mounds for some distance around. The orifice itself was redder than normal. Indigo carmine appeared in the jets from the right side in fourteen minutes, but its appearance was delayed on the affected side until about half an hour had elapsed. It was also noticed that whereas on the sound side the efflux was vigorous, the jet on the affected side was feeble, and appeared to flow lazily from the orifice. The jets on the affected side were at the rate of one every twenty-five to thirty seconds, whereas on the sound side the effluxes appeared in rapid succession at the rate of once every eight to ten seconds. The ureteral catheter was arrested about half an inch up on the affected side. There was no pus or blood in the urine since his admission to hospital. In this case, as in the preceding, the most careful search in the kidney and ureter failed to discover the calculus, which Mr. Fullerton believed he must have pushed into the stone, as the attacks had disappeared. The stone was evidently, as in the last case, very small, as urine was able to get past the obstruction, though, as evidenced by the diminished force of the jet, with difficulty. (7) In the seventh case Mr. Fullerton was obliged to remove the kidney, which was in a condition of pyonephrosis. He showed the stone and the kidney at a recent meeting of the Ulster Medical Society. The only sign in this case, that of a late stage of pyonephrosis, was the fact that no cause could be discovered. On cystoscopic examination the orifice of the left ureter immediately attracted attention. It was almost buried in oedematous mucous membrane, and there was a good deal of redness round it. The jets from this ureter were very irregular, and the quantity small. On the right side the jets were at the rate of 4 or 5 drops every 15 to 20 seconds. The left-sided specimen was of very low specific gravity, 1002, and contained pus and albumen, while that from the right had a specific gravity of 1015, and was free from albumen and pus. Acting on these indications he cut down on the left kidney and found a stone ulcerating through the ureter at its junction with the pelvic dilatation. There was a small groove on one side of the stone past which urine trickled into the bladder. The calculus, like most of the others, was composed of oxalate of lime. As he had stated, he removed the kidney on account of its disorganization, and the patient made an uninterrupted recovery.

These were all the cases that Mr. Fullerton had operated on since he began to investigate, before operation, the condi-

tion of the presumably healthy organ, and they had all, as he had stated, made good recoveries. In addition, he had investigated three others recently, two of which had passed the calculi now shown, making a sum total of ten cases of renal calculus, which showed that this condition was not so rare in this part of the country as they used to believe. He drew attention to the following additional aids to diagnosis brought out by this series. First, the alteration in the appearance of the orifice of the ureter on the affected side. Secondly, the alteration of the specific gravity of the urine emitted from the affected kidney. As a rule it was markedly diminished, in most cases on account of increased rapidity of secretion, due to the irritation of a foreign body, but in some, as in Case VII, on account of destruction of the secreting substance of the kidney. Thirdly, the value, which he had not been able fully to estimate as yet, of the use of coloured substances to determine the functional capacity of the kidneys. He hoped to make further observations in this direction as opportunity offered. Finally, he directed attention to a method of distinguishing calculi from other opaque substances in the abdomen and pelvis, suggested first by Fenwick. The x-ray photograph which was taken in Case VI by Dr. Rankin would illustrate what he meant. In this case Mr. Fullerton passed long ureteral catheters armed with soft wire into the pelvis of the kidney on both sides. An x-ray photograph was then taken with the instrument and catheters *in situ*, showing the course of the ureters from the bladder to the pelvis of the kidney. There were great possibilities in this method which would be obvious to all. With all the means at their disposal which he had used in the small series of cases to which he had directed attention, it would no doubt be possible to diagnose these cases with more accuracy than in former times. The paper was discussed by the President and Drs. DARLING and WALTON BROWNE.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH.—The winter clinical meeting of the Edinburgh Branch will be held in the Royal Infirmary, Edinburgh, on Friday, February 26th, at 4 p.m. The members of the other Scottish Branches are invited to attend the meeting. The museum will be open at 11 a.m., and special clinics will be held during the forenoon. Dinner in the Royal British Hotel, Princes Street, at 6.30 p.m.; morning dress; dinner ticket, 5s.—A. LOGAN TURNER, FRANCIS D. BOYD, Honorary Secretaries.

CAMBRIDGE AND HUNTINGDON BRANCH.—A meeting of this Branch will be held at the Medical Schools, Cambridge, on Friday, March 5th, at 2.15 p.m.—H. B. RODERICK, M.D., Honorary Secretary.

LANCASHIRE AND CHESHIRE BRANCH: WARRINGTON DIVISION.—The quarterly meeting of this Division will be held on Tuesday, March 2nd, at the Infirmary, Warrington, at 4.30 p.m. Dr. Garstang, a member of the Central Council, will be present.—T. A. MURRAY, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: HAMPSHIRE DIVISION.—The next meeting of this Division will be held on Tuesday, February 23rd, at 8.30 p.m., at the Hampstead Conservative, Swiss Cottage, N.W., Dr. Oppenheimer in the chair. Agenda: (1) Minutes. (2) Correspondence. (3) Questions. (4) To consider the Report of the Public Health Committee published in the SUPPLEMENT of the BRITISH MEDICAL JOURNAL for January 23rd, 1909. (5) Other business (to be arranged).—R. A. YELD, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: WANDSWORTH DIVISION.—A meeting of this Division will be held on Tuesday, February 23rd, at the Tooting Bee Asylum, S.W., at 4.30 p.m. Agenda: (1) Minutes. (2) Correspondence. (3) Questions. (4) Demonstration of some cases of interest at present in the asylum by Dr. E. H. Beresford. (5) Election of Representative at the Representative Meetings. (6) Dr. Fothergill will draw attention to the Report of the Science Committee, SUPPLEMENT,

p. 78, and move that the following resolution be placed on the Agenda for the Representative Meeting in July: "That, with a view to further interesting Divisions and Branches in the Section work of the Annual Meeting, it be an instruction to the Central Council to encourage them to nominate one or more members to take part in the discussions on any subject arranged for which has previously been considered by the Division or Branch.—C. J. MARTIN, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER DIVISION.—A meeting of this Division will be held at the Criterion Restaurant, at 8.30 p.m., on Thursday, March 4th. Dinner, 7.30 p.m.—J. HOWELL EVANS, co-Honorary Secretary.

MIDLAND BRANCH: LEICESTER AND RUTLAND DIVISION.—A special meeting of this Division will be held at the Leicester Infirmary on Wednesday, February 24th, at 4.15 p.m. Agenda: Discussion of certain questions relating to medical inspection of school children.—WILFRED E. GIBBONS, Honorary Secretary, Leicester.

STAFFORDSHIRE BRANCH.—The second general meeting of the session will be held at the North-Western Hotel, Stafford, on Thursday, February 25th. The President, Dr. S. King Alcock, will take the chair at 5.15 p.m. Business: (1) Minutes of the last ordinary general meeting. (2) Correspondence. (3) Exhibition of living cases. (4) Paper: Mr. A. B. Cridland, Internal Squint in Children. (5) Paper: Mr. J. T. Hartill, Short Notes on a Rare and Interesting Case of Retention of Meneses, and Operations for and Relief of the Symptoms. (6) Exhibition of pathological specimens, etc. Dinner 7.15 p.m., charge 5s.—G. PETGRAVE JOHNSON, Honorary General Secretary, Stoke-on-Trent.

YORKSHIRE BRANCH.—The next meeting of the Branch will be held at the Royal Eye and Ear Hospital, Bradford, on Wednesday, March 10th, at 4.30 p.m. Members intending to read papers, abstracts or specimens, or to propose new members, are requested to communicate at once with the Secretary. Members will dine together at 6.30.—ADOLPH BRONNER, Honorary Secretary, Bradford.

Hospitals and Asylums.

SUFFOLK DISTRICT ASYLUM.

The annual report for the year 1907 of Dr. James R. Whitwell, the medical superintendent of this asylum, shows that on January 1st there were 877 patients in the asylum, and that on the last day of the year there remained 870, giving a decrease of asylum patients of 7. The actual numbers of patients belonging to the district were: On December 31st, 1906, 730, and on December 31st, 1907, 763, giving the exceptionally large increase for the year of 33. The total cases under care during the year numbered 1,079, and the average number daily resident 89. During the year 202 were admitted, of whom 194 belonged to the district. Of the total admissions 177 were direct and 25 indirect admissions. In 74 the attacks were first attacks within three, and in 25 more within twelve, months of admission; in 56 no first attacks—or unknown whether first attack or not—within twelve months of admission; and in the remainder the attacks were either of more than twelve months (25), or of unknown duration (11), or congenital cases (11). The 177 direct admissions were classified according to the forms of mental disorder on admission into: Mania of all kinds, 43; acute and chronic melancholia, 43; senile and secondary dementia, 22; delusional insanity, 6; alternating insanity, 5; stupor, 12; confusional insanity, acute delirium, and general paralysis, 2 each; primary dementia, 1; insanity with epilepsy, 9; and congenital or infantile defect, 10. As regards the supposed etiological factors, and still considering only the direct admissions, alcohol was assigned in 20, or 11.3 per cent. On this point Dr. Whitwell has considered and well-considered words to say in his report, which is illustrated by a map of England and Wales, showing the relative distribution of drunkenness in the several counties as gauged by the numbers of conviction of drunkenness. From this it appears that Durham county is the most, and Wiltshire one of the least, alcoholized, whereas Durham county gives a low and Wiltshire a very high rate of insanity. Dr. Whitwell, however, does not attach an unduly high value to mental instability in 9, and mental stress in 29. A heredity of insanity was ascertained in 64, or 36 per cent, an epileptic heredity in 2, a neurotic heredity in 10, and a heredity of alcoholism also in 10. During the year 51 were discharged as recovered, giving a recovery-rate on the direct admissions of 28.8 per cent., or of recoveries in the direct admissions on the direct admissions of 25.9 per cent.

There were also discharged as relieved 34 and as not improved 46. During the year 73 died, giving a death-rate on the average numbers present of 8.71 per cent. The deaths were due in 13 to cerebro-spinal diseases, including 5 deaths from general paralysis; in 11 to diseases of heart and blood vessels; in 3 to diseases of the respiratory organs; in 13 to abdominal diseases; in 16 to senile decay, and in 22 to general diseases, including 15, or 19.2 per cent. of the total deaths, to tuberculous diseases. No inquests were held during the year and the casualties were few and unimportant.

Vital Statistics.

EPIDEMIC MORTALITY IN LONDON.

[SPECIALLY REPORTED FOR THE BRITISH MEDICAL JOURNAL.]

THE accompanying diagram shows the prevalence of the principal epidemic diseases during the fourth quarter of last year; the fluctuations of each disease and its relative fatality compared with that in the corresponding periods of recent years can thus be readily seen.

Small-pox.—No fatal case of this disease has been registered in London since the middle of 1895, and no small-pox patients were under treatment last quarter in the Metropolitan Asylums Hospitals.

Measles.—The deaths from measles, which had been 346, 477, and 258 in the three preceding quarters, rose again last quarter to 457, and were 53 in excess of the corrected average number for the corresponding period of the five preceding years; among the various metropolitan boroughs this disease was proportionally most fatal in St. Mary-lebone, Islington, Finsbury, Bethnal Green, Stepney, Southwark, and Bermondsey.

Scarlet Fever.—The fatal cases of scarlet fever, which had been 186, 122, and 101 in the three preceding quarters, increased to 135 last quarter, but were 32 fewer than the corrected average number. The greatest proportional mortality from this disease was recorded in Stoke Newington, Hackney, Shoreditch, Bethnal Green, Stepney, Poplar and Bermondsey. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals, which had been 3,150, 2,534, and 3,431, at the end of the three preceding quarters, had further risen to 3,498 at the end of last quarter; 6,223 new cases were admitted during the quarter, against 5,101, 4,194, and 5,344 in the three preceding quarters.

Diphtheria.—The deaths from this disease, which has been 244, 131, and 154 in the three preceding quarters, rose last quarter to 227, and showed a slight excess over the corrected average number. The highest death-rates from this disease last quarter were recorded in Fulham, Chelsea, Islington, Shoreditch, Stepney, Lewisham, and Woolwich. The Metropolitan Asylums Hospitals contained 1,241 diphtheria patients at the end of last quarter, against 1,081, 768, and 953 at the end of the three preceding quarters; 2,141 new cases were admitted during the quarter, against 1,872, 1,335, and 1,449 in the three preceding quarters.

Whooping-cough.—The fatal cases of whooping-cough, which had been 406, 334, and 163 in the three preceding quarters, further declined

last quarter to 96, the corrected average number in the corresponding period of the five preceding years being 249. The greatest proportional mortality from this disease occurred in Paddington, Chelsea, Finsbury, Shoreditch, and Bethnal Green.

Fever.—Under this heading are included deaths from typhus, from enteric fever, and from ill-defined pyrexia. The deaths referred to these different forms of "fever," which had been 40, 27, and 53 in the three preceding quarters, rose last quarter to 126, and were 13 above the corrected average number. All the deaths under this heading last quarter were from enteric fever, this disease being proportionally most fatal in Chelsea, Stoke Newington, Holborn, Finsbury, Shoreditch, Bethnal Green, Bermondsey, and Greenwich. The number of enteric fever patients under treatment in the Metropolitan Asylums Hospitals, which had been 73, 48, and 93 at the end of the three preceding quarters, had risen to 147 at the end of last quarter; 313 new cases were admitted during the quarter, against 135, 94, and 166 in the three preceding quarters.

Diarrhoea.—The 636 deaths from diarrhoea in London last quarter were 55 in excess of the corrected average number for the fourth quarters of the five preceding years. The greatest proportional mortality from this disease was recorded in Finsbury, Stepney, Southwark, Bermondsey, Deptford, and Lewisham.

In conclusion it may be stated that the 1,646 deaths in London referred to the principal infectious diseases last quarter were 2.3 per cent. below the average. No death from any of these diseases was recorded last quarter in the City of London; among the metropolitan boroughs they caused the lowest death-rates in Paddington, Westminster, Hampstead, St. Pancras, Wandsworth, and Camberwell, and the highest rates in Finsbury, Shoreditch, Bethnal Green, Stepney, Bermondsey, and Lewisham.

HEALTH OF ENGLISH TOWNS.

IN seventy-six of the largest English towns, including London, 8,163 births and 5,518 deaths were registered during the week ending Saturday last, February 13th. The annual rate of mortality in these towns, which had been 18.0 and 13.7 per 1,000 in the two preceding weeks, declined again last week to 17.5 per 1,000. The rates in the several towns ranged from 8.2 in Reading, 10.5 in Burton, 10.9 in Hornsey, 11.1 in Walthamstow and in Gateshead, 11.4 in York, and 11.6 in Barrow-in-Furness and in Halifax, to 21.3 in Merthyr Tydfil, 21.5 in Liverpool, 21.6 in Warrington, 21.8 in Salford, 22.0 in Bury, 22.3 in Middlesbrough, 22.8 in Blackburn, 25.0 in Wallasey, and 25.5 in Oldham. In London the rate of mortality was equal to 17.8 per 1,000, while it averaged 17.4 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.4 per 1,000 in the seventy-six towns; in London also this death-rate was equal to 1.4 per 1,000, while among the seventy-five other large towns the death-rates from the principal infectious diseases ranged upwards to 3.0 in Birkenhead and in Middlesbrough, 3.4 in Birmingham, 3.5 in Bury, 3.6 in West Ham, 3.7 in Huddersworth (Staffs), 3.9 in West Hartlepool, and 4.4 in St. Helens. Measles caused a death-rate of 1.3 in Plymouth and in Sheffield, 1.5 in Stockport and in Middlesbrough, 1.6 in Sunderland, 1.7 in Leicester, 1.8 in West Ham, 2.2 in Warrington, 2.3 in Birmingham, and 3.3 in West Hartlepool; scarlet fever of 1.5 in Wallasey, 1.7 in Birkenhead, and 1.8 in Bury; diphtheria of 1.3 in Newport (Mon.), 1.6 in St. Helens, and 2.2 in Huddersworth (Staffs); and whooping-cough of 1.1 in

DEATHS FROM EPIDEMIC DISEASES IN LONDON DURING THE FOURTH QUARTER OF 1908.

NOTE.—The black lines show the recorded number of deaths from each disease during each week of the quarter. The dotted lines show the average number of deaths in the corresponding weeks of the five preceding years, 1903-7.

St. Helens, 1.3in Preston, and 2.0 in Great Yarmouth. The mortality from enteric fever and from diarrhoea showed no marked excess in any of the large towns; one fatal case of small-pox was registered in Bristol, but none in any other of the seventy-six towns. The number of scarlet fever patients remaining under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 3,211, 5,201, and 3,147 at the end of the three preceding weeks, had further fallen to 3,002 at the end of last week; 289 new cases were admitted during the week, against 379, 339, and 312 in the three preceding weeks; the case of small-pox admitted in the previous week remained under treatment at the end of last week.

HEALTH OF SCOTTISH TOWNS.

DURING the week ending Saturday last, February 13th, 893 births and 652 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 17.2 and 18.5 per 1,000 in the two preceding weeks, declined again to 16.2 and 16.00 last week, but was 0.7 per 1,000 above the mean rate during the same period in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 15.2 in Perth and 14.8 in Edinburgh to 21.6 in Paisley and 22.5 in Dundee. The death-rate from the principal infectious diseases averaged 2.0 per 1,000 in these towns, the highest rates being recorded in Glasgow and Aberdeen. The 306 deaths registered in Glasgow included 2 which were referred to scarlet fever, 4 to diphtheria, 20 to whooping-cough, 2 to enteric fever, and 2 to diarrhoea. Two fatal cases of whooping-cough and 2 of diarrhoea were recorded in Edinburgh; 2 of scarlet fever, 2 of diphtheria, and 3 of whooping-cough in Dundee; 8 of whooping-cough and 3 of diarrhoea in Aberdeen; and 3 of whooping-cough in Paisley and 2 in Leith.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, February 13th, 632 births and 447 deaths were registered in the twenty-two principal urban districts of Ireland as against 618 births and 454 deaths in the preceding period. The annual death-rate in these districts, which had been 21.6, 22.5, and 20.7 per 1,000 in the three preceding weeks, fell to 19.4 per 1,000 in the week under notice, this figure being 2.9 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 25.1 and 15.6 respectively; those in other districts ranged from 4.5 in Lisburn and 5.2 in Portadown, to 33.0 in Queenstown and 36.8 in Drogheda, while Cork stood at 24.0, Londonderry at 18.1, Limerick at 23.2, and Waterford at 5.8. The zymotic death-rate in the twenty-two districts averaged the same as in the preceding period—namely, 1.0 per 1,000.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

DEPUTY INSPECTOR-GENERAL L. H. KELLET, M.D., is promoted to be Inspector-General, January 17th. His previous commissions are thus dated: Surgeon, September 30th, 1876; Staff Surgeon, September 30th, 1885; Fleet Surgeon, April 27th, 1893; and Deputy Inspector-General, December 5th, 1903. He was Sign Surgeon of the *Fatma* during the Egyptian war in 1882, and has received a medal and the Khedive's bronze star.

Fleet Surgeon W. M. CRAIG, M.B., to be Deputy Inspector-General, January 17th. He entered the service as Surgeon, August 26th, 1882, became Staff Surgeon, August 28th, 1894; and Fleet Surgeon, August 28th, 1898.

Surgeons E. COX, M.B.; J. MACDONALD, M.D.; A. LA T. DARLEY, A. J. WERNER, C. G. STANFORD, M.D.; A. R. THOMAS, D.V.; T. V. THOMAS, G. C. R. COSS, M.D.; P. F. ALDERSON, and F. C. WOODYAT are promoted to be Staff Surgeons from February 1st. Their commissions as Surgeons are dated February 11th, 1901.

The following appointments have been made at the Admiralty: Fleet Surgeon J. SHAND, M.B. to the *Africa*, on recommissioning, February 16th, since cancelled on appointment to Malta Hospital, February 6th; Fleet Surgeon R. MILLER, M.B., and Surgeon G. A. BRADSHAW, to the *Daedalus*, on recommissioning, February 16th; Fleet Surgeon C. T. BATHUR, to the *Harrier* Home Fleet, February 16th; Fleet Surgeon E. COOPER and Surgeon W. H. EGGAR, M.B., to the *Bellerophon*, on commissioning, February 20th; Staff Surgeon G. E. DUNCAN, to the *Prince George*, until paying off, February 20th; Surgeon C. R. M. BAKER, M.B., to the *King Alfred*, additional, December 22nd, 1903, his appointment to the *Sandpiper* being cancelled; Surgeon P. B. EGAN, M.D., to the *Africa*, on recommissioning, February 16th; Fleet Surgeon A. H. L. COX, to the *Africa*, February 6th, and on recommissioning, February 16th; Surgeon J. G. KELLY, M.B., to the *Arthur*, February 17th, and to the *Lapwing*, on recommissioning, undated; Staff Surgeon A. G. EASTMENT, to Plymouth Hospital, for instruction of sick berth staff, February 13th; Staff Surgeon J. N. ROBERTSON, to the *His Majesty's Dockyard*, at Chatham, February 15th; Staff Surgeon F. C. B. GITTINGS, M.B., to the *Forestair*, February 15th; Staff Surgeon D. V. LOWNDSE, to the *Victory*, additional, for disposal, March 5th; Surgeon R. L. JONES, to the *Shannon*, February 15th; Surgeon J. S. F. WATKINS, M.D., to the *Albatross*, February 15th; Surgeon M. W. HAYDON, to the Royal Marine Artillery, Eastney, March 5th.

The following appointments are cancelled: Fleet Surgeon F. W. PARKER to Malta Hospital, February 16th, H. C. to be dated to the *Daedalus*; Surgeon E. S. WILKINSON, M.B., to the *Royal Arthur* and *Lapwing*; Mr. J. M. ROSS, M.B., to be Surgeon and Agent at Ruff of Lewis, February 10th.

ARMY MEDICAL SERVICE.

MAJOR R. J. A. DURANT is placed on retired pay, February 2nd. He was appointed Surgeon, February 2nd, 1884, and Surgeon-Major, February 2nd, 1898.

The undermentioned Lieutenants are promoted to be Captains, dated January 31st, 1909: JOHN A. ANDERSON, M.B.; CUTHBERT G. BROWNIE, HUGH G. SHERRIN, HENRY H. A. EDMONDSON, M.B.; ROWLAND P. LEWIS, JAMES H. GRAHAM, M.B.; WALLACE BENSON, M.B.; GEORGE E. FERGUSON, CHARLES E. W. S. FAWCETT, M.D.; ALEXANDER M. ROSE, M.B.; GRIFFITH H. REES, M.B.; THOMAS SCATCHARD, VIVIAN H. SYMONS, EDWARD G. ANTONISZ, RONALD A. BRYDEN, EDWARD L. MOSS, ARTHUR E. S. IRVINE, THOMAS B. MONIART, MICHAEL B. H. RICHIE, M.B.; WALTER J. WESTON, PERCIE PARKMAN, ALBERT E. F. HASTINGS, MONTMERE J. CROFT, EDMUND T. POTTS, M.D.; GEORGE W. V. WARE, M.B.; WILLIAM MCCONAGHY, M.B.; WILLIAM C. NIMMO, CECIL J. WYATT, M.B.; MICHAEL KEANE, CHARLES F. WHITE, M.B.; FRANCIS C. SAMPSON, M.B.; THOMAS S. BLACKWELL, ROBERTSON S. SMYTH, M.D.; HAROLD

E. PRIESTLEY, PHILIP J. MARETT, and HUGH STEWART, M.B. Their first appointment dates from July 1st, 1905.

The undermentioned Lieutenants are confirmed in that rank: RONALD E. TODD, M.B.; CHARLES KYLE, M.B.; DAVID S. BUIST, M.B.; WILLIAM E. MARSHALL, M.B.; ALEXANDER M. POLLARD, COLIN CLAUDE, M.B.; EDMUND V. VAUGHAN, M.B.; ARTHUR N. R. McNEILL, M.B.; ANDREW R. WRIGHT, M.B.; THOMAS B. NICHOLLS, M.B.; JELIAN B. JONES, M.B.; STUART MCK. SATCHEL, THOMAS J. MITCHELL, M.B.; FRANK H. SOMERS-GARDNER, M.B.; DONALD H. C. MCARTHUR, M.B.; DENIS E. C. POTTINGER, M.B.; GEORGE S. PARENSON, HERBERT GALL, CHARLES H. O'HORRE, M.B.; ARTHUR W. BYRNE, M.B.; JOHN STANTON, CHARLES G. SHERRLOCK, M.D.; GEORGE H. STACE, M.B.; SAMUEL W. KYLE, M.B.; HAROLD BEVIS, JOHN W. LANE, M.D. Lieutenant Todd was appointed on probation, July 29th, 1907; all the other officers cited, August 1st, 1908.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

The British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the **BRITISH MEDICAL JOURNAL** is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association, and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the **BRITISH MEDICAL JOURNAL** for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

MATTERS REFERRED TO DIVISIONS.

HOSPITALS COMMITTEE.

REPORT

ON

MEDICAL CERTIFICATION OF SUITABILITY OF PATIENTS FOR HOSPITAL TREATMENT.

(For Consideration by Divisions, and Instruction accordingly of Representatives in Representative Meetings.)

The Annual Representative Meeting at Sheffield passed the following resolution:—

71A. That the Council be instructed further to consider and report on the subject of medical certification of suitability of patients for admission to hospitals.

The Council reports on the matter as follows:—

1. The first and fundamental principle laid down, after mature consideration, by the Hospitals Committee of the Association and by the Joint Hospitals Committee, and subsequently approved by the Representative Meeting of the Association and by the United Kingdom Hospitals Conference, is as follows:—

Suitability of Patients for Admission.—That inability to pay for adequate treatment shall be the consideration for the admission of all patients for hospital treatment. This shall not apply to Poor-law cases.

2. It was also agreed:—

Evidence of Suitability.—That except in emergencies sufficient evidence shall be obtained on two points: (a) That the patient is not in a position to pay for adequate treatment; (b) That the case is, from a hospital point of view, suitable for treatment.

3. Thus the test of "inability to pay for adequate treatment" is recognized as involving the consideration of two elements, namely, first, the financial suitability, and secondly, the medical suitability, of the patient for hospital treatment, these two being to a considerable extent interdependent. A patient may be able to pay for ordinary treatment but not for the special treatment which an exceptional case may require. Hence no mere provision of a wage limit or similar purely financial test will meet the requirements of the case, nor will almoners' enquiries, since these, though of the greatest value to the economic side of the matter. The ordinary medical attendant of the patient is the only person who, on the application of the patient, can give reliable information as to the medical necessities of the case, and he is usually also in a position to say whether the patient can afford to pay for such treatment as his case requires.

4. It is clear, therefore, that the adoption by hospitals of a rule that a certificate from the medical attendant, if any, should be required as a condition of hospital treatment would afford some protection to hospitals against the acceptance of unsuitable cases.

5. If properly carried out by medical practitioners, it would also afford the profession some protection against the evils which it suffers through hospital abuse.

6. Taking the three classes of cases—casualties, in-patients, and out-patients—certification is obviously impracticable in the case of casualties until after the first visit. As regards in-patients it is already generally required, and if the gradual conversion of out-patient departments into consultative departments, which the Association has this year recommended, be carried into effect, medical certification will be an essential part of the working of such departments.

RECOMMENDATION.

7. On these grounds it is recommended that a definite pronouncement should be made by the Association as follows:—

That a Medical Certificate of suitability for hospital treatment be required as a condition of hospital treatment, except in case of casualties.

ADDENDUM.

*Extract from (Majority) Report of the Royal Commission
on the Poor Law.*

Since the above Report was approved by the Council of the Association the Report of the Royal Commission on the Poor Law has appeared.

That Report contains the following paragraph, the last sentence of which bears so closely upon the subject of medical certification of hospital patients that the Chairman of the Hospitals Committee has considered it desirable to append a copy of it to the Report of the Council:

Poor Law Report.

Part V, Chapter 2, Paragraph 169.—Until, therefore, the work of the out-patient department is delimited in such a way as to prevent overlapping between its sphere and that of the Public Assistance Authority, and to leave full scope for private practice and provident effort, any endeavour to reform the system of public medical assistance will be locally thwarted. Indeed, all attempts to create order out of the present chaos will be disappointing. Even in the interests of the out-patient departments themselves a reform appears to be expedient in order to secure the greatest benefits from the treatment which they so lavishly bestow, and to prevent those benefits from being abused by the well-to-do. Suggestions for remedying the abuses of the out-patient departments have been laid before us by many witnesses, but by none more fully than the representatives of the British Medical Association. We are convinced with them that a strenuous effort should be made to circumscribe the work of the out-patient departments. They should be used almost exclusively for:

- (1) Casualties.
- (2) Consultations.
- (3) Cases requiring expensive equipment for the treatment of special diseases and defects.

To this end the "letter" system should be thoroughly reformed or abolished, and, except for casualties, the recommendation of a medical officer or private practitioner substituted.

REPORT

ON

CONTRIBUTIONS TO HOSPITALS BY
EMPLOYERS OF LABOUR AND
EMPLOYEES.

*(For Consideration by Divisions with a view to Report
by them to Hospitals Committee.)*

The Annual Representative Meeting at Sheffield instructed the Council to refer for the consideration of the Divisions the subject of the following motions:—

150. (a) That the contributions to hospitals by employers of labour and employees by means of weekly collections and otherwise should be considered as being the payment of premiums for a proportionate insurance against liability for medical and hospital attendance in cases of serious illness and accident, which are made on behalf of those unable themselves to pay directly or adequately for the same, and not as entitling the contributors to unlimited hospital, as also gratuitous medical, attendance as at present seems to be claimed.
- (b) That it be an instruction to the central Hospitals Committee of the Association to endeavour, through the Divisions and otherwise, to obtain acceptance for this principle by the several parties concerned, with a view to elaborating some scheme whereby these contributions should be paid to the rightful parties, viz., Insurance Companies, who in their turn will proportionately recompense Hospital and similar Boards, Hospital Staffs, General Practitioners, &c., for all attendances given on illnesses or accidents incurred by those so insured, reporting from time to time to this Body.

For the assistance of the Divisions in considering the subject, the Council submits the following

MEMORANDUM.

1. It will be seen that motion (a) contains two proposals as to the rights which should be conceded to certain classes of persons in respect of their contributions to Hospital Funds.

2. The negative proposal to the effect "that such contributions should not be considered as entitling the contributors to unlimited Hospital, as also to gratuitous medical, attendance . . ." may perhaps be regarded as non-controversial among those who have paid special attention to the principles of Hospital administration, though its truth is not yet sufficiently recognised by contributors to Hospital funds. It is entirely in accordance with the principles which, on the recommendation of the Committee, have received the approval of the Representative Meeting and of the United Kingdom Hospitals Conference.

3. The positive proposal, namely, "that the contributions in question should be considered as being the payment of premiums for a proportionate insurance against liability for medical and hospital attendance in cases of serious illness and accident, which are made on behalf of those unable themselves to pay directly or adequately for the same," appears to the Committee to be novel and to require careful consideration by the Divisions before it is accepted as influencing the policy of the Association.

4. In the motion (b) referred to the Divisions a new method is proposed of dealing with the contributions in question. The basis of this method is the conception, above referred to, of such contributions as insurance premiums. It would, if adopted, introduce a new element into the financial arrangements and probably, therefore, into the control of hospitals. Large sums would, in such case, be received through Accident and Sickness Insurance Companies who would inevitably claim representation in the management. The strictly charitable conception of Hospitals would thus be affected, and this appears to be recognised by the Division which framed the motion, inasmuch as reference is made to payments to Hospital staffs by Insurance Companies. Such payments must raise questions of great difficulty as to the persons by whom and the manner in which the Hospital staffs are to be appointed.

5. The Council, therefore, does not think it well to make any definite recommendation on the matter until it has received a general discussion in the Divisions, but considers that the Divisions should realise, when having the subject before them, that the affirmation of such a principle would constitute a definite departure from, or even reversal of, the policy of the Association previously declared, and might have dangerous and far-reaching results.

MIDWIVES ACT COMMITTEE.

WANT OF REPRESENTATION OF GENERAL PRACTITIONERS
AND MIDWIVES.

The following letter has been addressed on behalf of the British Medical Association to the Lord President of the Council, expressing the opinion that it is desirable that representatives of general medical practitioners and of midwives should be added to the Departmental Committee of the Privy Council now sitting to consider the working of the Midwives Act, with reference in particular to the supply of midwives and the cost of training, the remuneration of medical men summoned on the advice of midwives under the rules made in pursuance of the Act, and the delegation of their powers by county councils under the Act.

The reply of the Lord President is appended.

My Lord,

The Council of the British Medical Association would most respectfully submit for your Lordship's consideration that it is desirable that representatives of general medical practitioners and of Midwives should be added to the Departmental Committee of the Privy Council now sitting to consider various questions in connexion with the working of the Midwives Act (1902).

While fully appreciating the objections which may justly be urged against the representation of interested persons on Committees or Commissions which are

called upon in any sense to sit in judgement upon such persons, it is submitted that these considerations do not apply to the present case.

The Council of the British Medical Association understands that the object of the appointment of the Departmental Committee is to consider difficulties which experience has revealed in the practical working of the Midwives Act, and to suggest suitable means for preventing those difficulties, either by amendment of the Act or by adjustment of administrative arrangements in connexion therewith, whereby the objects of this enactment for the assistance and protection of child-bearing women and of infants may be more completely fulfilled.

As affecting an important group of difficulties which have arisen, and will doubtless require the consideration of the Committee, it will be appreciated by Your Lordship that so long as the State does not seek to impose any statutory obligation upon medical practitioners to attend women in labour, when summoned by Midwives, the fulfilment of the objects of the Act as regards the assistance and protection of such women must depend to a considerable extent upon the voluntary co-operation of members of the medical profession.

It is submitted with all respect that in the consideration of any amendments of the law or adjustments of working arrangements necessary to secure such co-operation it would be of material assistance to the Committee to have, not only the evidence of medical and other bodies, but also the presence at its deliberations of general medical practitioners and midwives who possess practical experience of the difficulties calling for attention.

I am, my Lord,
Your Lordship's most obedient Servant,
EDMUND OWEN,
Chairman of Council,
British Medical Association.

Feb. 18th, 1909.

The Rt. Honble. Viscount Wolverhampton, G.C.S.I.,
Lord President of the Privy Council.

The Clerk of the Council,
Privy Council Office,
London, S.W.,
20th February, 1909.

Sir,

Referring to your letter of the 18th instant, submitting, on behalf of the Council of the British Medical Association, that representatives of general medical practitioners and of midwives should be added to the Departmental Committee which has been appointed to consider the working of The Midwives Act, 1902, I am to state that, in the Lord President's opinion, the Committee, as constituted, is sufficiently large for the practical objects of the inquiry, which would not be served by the addition to its members of representatives of special interests, whose views will be properly considered in any evidence that may be given.

I am,
Sir,
Your obedient servant,
(Signed) A. W. FITZROY.

The Chairman of Council,
British Medical Association,
429, Strand, W.C.

LANCASHIRE AND CHESHIRE BRANCH: WARRINGTON DIVISION.—The quarterly meeting of this Division will be held on Tuesday, March 2nd, at the Infirmary, Warrington, at 4.30 p.m. Dr. Garstang, a member of the Central Council, will be present.—T. A. MURRAY, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: WALTHAMSTOW DIVISION.—The next meeting of the Division will be held at the residence of the Chairman, The Hollies, High Road, Wanstead (close to Snaresbrook Station), on Tuesday, March 2nd, at 4 p.m. Agenda: (1) Minutes. (2) Paper: Dysmenorrhoea, by Dr. T. G. Stevens. (3) To consider report of Medico-Political Committee on Medical Treatment of School Children. (4) Letters. (5) Any other business.—A. POTTINGER ELDRIDGE, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER DIVISION.—At the next meeting of the Division, to be held at the Criterion Restaurant, on Thursday, March 4th, at 8 p.m., Dr. A. A. Ewart, President, in the chair, Sir Patrick Manson, K.C.M.G., M.D., F.R.C.P., will open a discussion on Points to be Attended to in the Diagnosis of Fevers in Patients from the Tropics. 7.30 p.m., dinner; 8.30 p.m., Association business; 9 p.m., Discussion. All members of the profession, whether belonging to the Division or not, will be welcome at the meeting and at the dinner if they will notify one of the Honorary Secretaries.—HARVEY HILLARD, J. HOWELL EVANS, 25, Berkeley Square, Honorary Secretaries.

SOUTH-EASTERN BRANCH: GUILDFORD AND WINCHESTER DIVISIONS.—A joint meeting of the Guildford and Winchester Divisions will be held at the Royal Surrey County Hospital, Guildford, on Wednesday, March 10th, at 3 p.m. Agenda: (1) Minutes. (2) Colonel Firth, F.R.C.S., R.A.M.C. (Aldershot), will read a short paper on Some Reflections on the Theory of Heredity. (3) Dr. A. M. Mitchell (Guildford) will open a short Discussion on The Importance of Early Operation in Appendicitis. (4) Dr. Bodington (Winchester) will read notes of A Case of Sarcoma of the Spinal Column, with specimens (macroscopical and microscopical). (5) Dr. Kingsford (Woking) will read notes of A Case of Intestinal Obstruction due to an Impacted Gall Stone. (6) Mr. Eric Sheaf (Guildford) will read notes of Two Cases of Enlarged Thyroid Treated by Operation, and will exhibit specimens. (7) Dr. Garvin, Medical Superintendent of Lord Mayor Treloar's Cripples' Home, Alton, will read a paper on The Mechanical Treatment of Spinal Curves. (8) The following cases and specimens will be shown: (a) Mr. E. J. Smyth: Buphthalmos; (b) Mr. H. J. Fardon (for Dr. Brodribb): Pseudo-hypertrophic Paralysis in a Boy; (c) Dr. Briscoe (Alton): Specimens from 5 cases of morbus cordis in the insane. Other cases will be shown from the wards by members of the hospital staff if time permits. Tea will be provided at about 4.30. The Honorary Secretaries will be glad to hear from members whether they intend being present at the meeting or not, also from any others willing to show cases or specimens.—H. J. GODWIN, 35, Southgate Street, Winchester; E. J. SMYTH, "Maythorne," Guildford, Honorary Secretaries.

SOUTH-EASTERN OF IRELAND BRANCH.—A meeting of this Branch, and also a meeting of the Branch Council and local Division, will be held at the Club House, Carlow, on Wednesday, March 3rd, at 5.30 p.m. Agenda: (1) Minutes of last meeting. (2) Letters of apology. (3) Correspondence. (4) Discuss resolution from the Fermanagh Branch of the Irish Medical Association re the question of adequate remuneration for all subjects appertaining to public health and disease, so that philanthropy may no longer usurp the place of State responsibility, on the grounds that a knowledge of the teachings of the science of public health is as necessary to the community at large as are instructions in the arts of agriculture, dairying, fruit culture, the technicalities of various trades, the care of cattle, fowls, bees, etc. (5) Consider the resolution of this Branch, forwarded through the Irish Committee of the British Medical Association, with a view to legislation re the admission of patients of independent means into union hospitals, and sent back to the Branch by the Irish Committee for amendment. (6) Any other business. (7) Tea after meeting.—J. QUIRKE, Honorary Secretary, Piltown, co. Kilkenny.

YORKSHIRE BRANCH.—The next meeting of the Branch will be held at the Royal Eye and Ear Hospital, Bradford, on Wednesday, March 10th, at 4.30 p.m. Members intending to read papers, show specimens or cases, or to propose new members, are requested to communicate at once with the Secretary. Members will dine together at 6.30.—ADOLPH BRONNER, Honorary Secretary, Bradford.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

CAMBRIDGE AND HUNTINGDON BRANCH.—A meeting of this Branch will be held at the Medical Schools, Cambridge, on Friday, March 5th, at 2.15 p.m.—H. B. RODERICK, M.D., Honorary Secretary.

 To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

THE SEVENTY-SEVENTH ANNUAL MEETING
OF THE
BRITISH MEDICAL ASSOCIATION,
BELFAST,
JULY 23RD TO JULY 31ST, 1909.

President :

SIMEON SNELL, Hon.D.Sc., F.R.C.S.Edin., Ophthalmic Surgeon, Royal Infirmary, Sheffield.

President-elect :

Sir WILLIAM WHITLA, M.D., LL.D., Professor of Materia Medica and Therapeutics, Queen's College, Belfast.

Past-President :

HENRY DAVY, Hon.D.Sc., M.D., F.R.C.P.Lond., Physician, Royal Devon and Exeter Hospital, Exeter.

Chairman of Representative Meetings :

JAMES ALEXANDER MACDONALD, M.D., M.Ch., R.U.I., Physician, Taunton and Somerset Hospital.

Chairman of Council :

EDMUND OWEN, Hon.D.Sc., LL.D., F.R.C.S., Consulting Surgeon to St. Mary's Hospital, London.

Treasurer :

EDWIN RAYNER, M.D.Lond., F.R.C.S., Consulting Surgeon, Stockport Infirmary, Stockport.

The Seventy-seventh Annual Meeting of the British Medical Association will be held in Belfast in July, 1909, The President's address will be delivered on Tuesday, July 27th, and the Sections will meet on the three following days. The Annual Representative Meeting will begin on Friday, July 23rd, 1909.

PROGRAMME OF BUSINESS.

The Address in Medicine will be delivered by FREDERICK TAYLOR, M.D., F.R.C.P., Consulting Physician, Guy's Hospital.

The Address in Surgery will be delivered by ARTHUR EDWARD JAMES BARKER, F.R.C.S., Professor of the Principles and Practice of Surgery, University College, London.

The Address in Obstetrics will be delivered by Sir JOHN W. BYERS, M.D., Professor of Midwifery and Diseases of Women, Queen's College, Belfast.

The Popular Lecture will be delivered by Dr. J. A. MACDONALD, Physician to the Taunton and Somerset Hospital, Chairman of the Representative Meetings.

THE SECTIONS.

The scientific business of the meeting will be conducted in fifteen Sections, which will meet on Wednesday, July 23th, Thursday, July 29th, and Friday, July 30th.

The President, Vice-Presidents, and Honorary Secretaries of each Section constitute a Committee of Reference for that Section, and exercise the power of inviting, accepting, or declining any paper, and of arranging the order in which accepted papers shall be read. Communications with respect to papers should be addressed to one of the Honorary Secretaries.

A paper read in the Section must not exceed fifteen minutes, and no subsequent speech must exceed ten minutes.

Papers read are the property of the British Medical Association, and cannot be published elsewhere than in the BRITISH MEDICAL JOURNAL without special permission.

The following are the general arrangements so far as they are yet complete:

ANATOMY AND PHYSIOLOGY.

President : CHARLES SCOTT SHERRINGTON, M.D., F.R.S., Physiological Laboratory, University, Liverpool.

Vice-Presidents : Professor THOMAS HUGH MILROY, M.D., F.R.S.E., Queen's College, Belfast; Professor PETER THOMPSON, M.D., King's College, Strand, London; ARTHUR

PHILIP BEDDARD, M.D., F.R.O.P., 44, Seymour Street, Portman Square, London, W.; Professor ANDREW FRANCIS DIXON, M.B., D.Sc., 73, Grosvenor Road, Dublin.

Honorary Secretaries : ALEX. LOW, M.B., 142, Blenheim Place, Aberdeen; JOHN ALEX. MILROY, M.D., Queen's College, Belfast.

DERMATOLOGY AND ELECTRO-THERAPEUTICS.

President : WILLIAM CALWELL, M.D., 6, College Gardens, Belfast.

Vice-Presidents : ROBERT BRIGGS WILD, M.D., 96, Mosley Street, Manchester; LESLIE ROBERTS, M.D., 46, Rodney Street, Liverpool.

Honorary Secretaries : JAMES HARRY SEQUEIRA, M.D., F.R.C.P., 8A, Manchester Square, London; S. ERNEST DORE, M.D., 26, New Cavendish Street, London; JOHN CAMPBELL RANKIN, M.D., 38, University Road, Belfast.

A discussion will be held on the Treatment of Skin Diseases by Radium and Radio-therapy.

DISEASES OF CHILDREN.

President : HAROLD J. STILES, F.R.C.S.Edin., 9, Great Stuart Street, Edinburgh.

Vice-Presidents : JOHN McCaw, M.D., 74, Dublin Road, Belfast; RICHARD WHYTOCK LESLIE, M.D., "St. Heliers,"

Strandtown, Belfast; ROBERT CAMPBELL, F.R.C.S., 21, Great Victoria Street, Belfast.

Honorary Secretaries: ANDREW FULLERTON, F.R.C.S.I., 8, University Square, Belfast; JOHN WILLIAM SIMPSON, M.D., 19, Lansdowne Crescent, Edinburgh.

It is proposed to devote some portion of three of the days on which the Section meets to the discussion of the following subjects:

Wednesday, July 28th.—Club Foot.

Thursday, July 29th.—Functional Neuroses in Children.

HAEMATOLOGY AND VACCINE THERAPY.

President: Sir ALMROTH WRIGHT, M.D., F.R.S., 6, Park Crescent, Regent's Park, London, N.W.

Vice-Presidents: ALEX. GARDNER ROBB, M.B., 15, University Square, Belfast; THOMAS HOUSTON, M.D., 95, Great Victoria Street, Belfast; Captain STEWART RANKIN DOUGLAS, I.M.S., Inoculation Department, St. Mary's Hospital, London.

Honorary Secretaries: WILLIAM DUNLOP DONNAN, M.D., 12, High Street, Holywood, co. Down; DUDLEY W. CARMALT-JONES, M.B., B.Ch.Oxon., 78, Wimpole Street, London, W.

The subjects which have been chosen for discussion are:

Wednesday, July 28th.—Papers on separate subjects: Dr. Houston, Typhoid Carriers. Captain Douglas, Bacteriology of Cystitis; discussion. Dr. Fleming, Bacteriology and Vaccine Treatment of Acne.

Thursday, July 29th.—Discussion: The Early Diagnosis of Tuberculosis, opened by Professor Calmette, l'Institut Pasteur de Lille.

Friday, July 30th.—Discussion: Bacterial Infections of the Respiratory Tract other than Tuberculous.

INDUSTRIAL DISEASES AND PUBLIC HEALTH.

President: LOUIS COLTMAN PARKES, M.D., 61, Cadogan Square, Chelsea, London.

Vice-Presidents: SAMUEL AGNEW, M.D., Lurgan, co. Armagh; HENRY O'NEIL, M.D., 6, College Square East, Belfast; CHARLES KILLICK MILLARD, M.D., Town Hall, Leicester.

Honorary Secretaries: CHARLES PORTER, M.D., Public Health Department, Town Hall, Finsbury; WILLIAM McLORINAN, L.R.C.P., 103, Antrim Road, Belfast; THOMAS CARNWATH, M.B., Town Hall, Manchester.

The following subjects have been suggested for discussion:

1. The Compulsory Notification of all forms of Tuberculosis and the Mortality from Tuberculous Diseses in relation to Sex. To be opened by Dr. Harold Scurfield, Medical Officer of Health, Sheffield.

2. The Administrative Measures Necessary to Prevent the Spread of Enteric Fever by Convalescent Contacts and Carriers, and the Relations of the Paratyphoid Group of Organisms to Disease in Men and Animals.

3. Latent Infections of the Diphtheria Bacillus, and the Administrative Measures required for Dealing with Contacts. (Joint discussion with the Laryngological Section.)

LARYNGOLOGY, OTOTOLOGY, AND RHINOLOGY.

President: ST. CLAIR THOMSON, M.D., F.R.C.P., 28, Queen Anne Street, London.

Vice-Presidents: ERNEST BLECHYNDEN WAGGETT, M.B., 45, Upper Brook Street, London, W.; V. P. HENRY SMURTHWAITE, M.D., 8, St. Mary's Place, Newcastle-on-Tyne; J. A. KNOWLES RENSHAW, M.D., 11, St. John Street, Manchester.

Honorary Secretaries: HAROLD SHUTTLEWORTH BARWELL, F.R.C.S., 55, Wimpole Street, London; JOHN STODDART BARR, M.B., 13, Woodside Place, Glasgow; HENRY HANNA, M.B., B.Sc., 57, University Road, Belfast.

The following subjects have been selected for special discussion:

Wednesday, July 28th.—Discussion on a subject in Otolgy not yet selected.

Thursday, July 29th.—Discussion: Latent Infections of the Diphtheria Bacillus, including the Treatment of

Contacts. (In association with the Section of Industrial Diseases and Public Health.)

Friday, July 30th.—Discussion: The Treatment of Cicatricial Stenoses of the Larynx and Trachea.

Members are invited to contribute any preparations, specimens or drawings, or any instruments or apparatus pertaining to the work of the Section, which have been designed by themselves, in order that the Committee of the Section may make arrangements to form a special exhibit of such objects.

MEDICINE.

President: PROFESSOR JAMES ALEXANDER LINDSAY, M.D., F.R.C.P., 3, Queen's Elms, Belfast.

Vice-Presidents: ARTHUR FOXWELL, M.D., F.R.C.P., 47, Newhall Street, Birmingham; JOSEPH FRANCIS O'CARROLL, M.D., F.R.C.P.I., 43, Merrion Square, Dublin; LAURISTON ELGIE SHAW, M.D., F.R.C.P., 64, Harley Street, London; WILLIAM BAIRD MCQUITTY, M.D., 8, College Square East, Belfast.

Honorary Secretaries: JOHN SMYTH MORROW, M.D., Eia House, Antrim Road, Belfast; LEWIS ALBERT SMITH, M.D., 25, Queen Anne Street, London, W.; JOHN ELDER MACILWAINE, M.D., 55, University Road, Belfast.

The following subjects are suggested for discussion:

Wednesday, July 28th.—Metabolism.

Thursday, July 29th.—The Medical Aspects of Athleticism; Adolescent Albuminuria, or Mucous Colitis.

Friday, July 30th.—A Demonstration on Gastric Illumination.

NAVY, ARMY, AND AMBULANCE.

President: Fleet Surgeon J. LLOYD THOMAS, R.N.

Vice-Presidents: Inspector-General ROBERT BENTHAM, R.N. (retired), 22, King's Avenue, Ealing, London, W.; Lieut.-Colonel R. PORTER, R.A.M.C., F.M.O., Station Hospital, Military Barracks, Belfast; Colonel THOMAS H. HENDLEY, I.M.S., C.I.E., 4, London Road, London, N.W.

Honorary Secretaries: Captain M. LOWSLEY R.A.M.C., St. Michael's Road, Aldershot; Captain HERBERT HUGH BLAIR CUNNINGHAM, M.D., F.R.C.S., 69, University Road, Belfast; Surgeon EDMUND COX, M.B., R.N., The Royal Naval Hospital, Chatham; Captain WILLIAM SALISBURY-SHARPE, R.A.M.C., 8, Cleveland Terrace, Hyde Park, London, W.

The Committee of this Section suggest the following subjects:

1. Effect on Health of Service in Submarine Boats.

2. Conditions of Life in Boys' Training Establishments on Shore.

3. Medical Arrangements for War in Ships of *Dreadnought* type.

4. A Detailed Scheme for an Unexpected Landing Party, using Material available on Board Ship.

5. Pitfalls for the Recruiting Medical Officer.

6. Probable Effects in the Services of the New Treatment of Syphilis by means of Organic Arsenical Compounds.

7. On the Importance of the Permanent Attachment of Ample Transport under the Command of the Medical Officer to each Field Medical Unit.

8. The Infective Pneumonias, their Incidence, Causes, Prevention, and Treatment during a Campaign.

9. On the Existing Ambulance Organization of the Home Railway Companies, with Suggestions for its Amplification and Unification.

10. The Effects of Recent Research on the Work of Colonial Medical Officers.

11. Diagnosis and Treatment of Pulmonary Tuberculosis in the Services.

12. Collection and Disposal of Wounded in War.

OBSTETRICS AND GYNAECOLOGY.

President: JOHN CAMPBELL, M.D., F.R.C.S., Crescent House, University Road, Belfast.

Vice-Presidents: ROBERT ALEXANDER GIBBONS, M.D., 29, Cadogan Place, London; JOHN SINGLETON DARLING, M.B., High Street, Lurgan; CHARLES EDWIN PURSLOW, M.D., 192, Broad Street, Birmingham; EWEN JOHN MACLEAN, M.D., 12, Park Place, Cardiff.

Honorary Secretaries: HENRY THOMAS HICKS, F.R.C.S. Derby; ROBERT JAMES JOHNSTON, M.B., F.R.C.S. 14, University Square, Belfast.

The Committee have thought it well to select two chief subjects for discussion:

1. The Treatment of the Graver Forms of Puerperal Sepsis.
2. Endometritis.

In the Pathological Part of this Section, Cancer of the Uterus has been chosen as one affording a wide scope for the exhibition of Specimens, Photographs, Microscopic Slides, etc.

These, with any others of interest, will be exhibited in the Pathological Museum.

OPHTHALMOLOGY.

President: JOHN WALTON BROWNE, M.D., 10, College Square North, Belfast.

Vice-Presidents: ARTHUR W. SANDFORD, M.D., 13, St. Patrick's Place, Cork; WILLIAM MARCUS KILLEN, M.D., 9, Clifton Street, Belfast; ALEX. HILL GRIFFITH, M.D., 17, St. John Street, Manchester.

Honorary Secretaries: JAMES ANDREW CRAIG, F.R.C.S., 11, University Square, Belfast; LESLIE JOHNSTON PATON, F.R.C.S., 1, Spanish Place, Manchester Square, London.

The subjects chosen for discussion are:

1. Eye Injuries in their Relation to the Workmen's Compensation Act.
2. Vascular Diseases of the Retina.
3. The Diseases of the Lymphoid Tissue of the Conjunctiva (Mr. Treacher Collins).

PATHOLOGY.

President: Professor WM. ST. CLAIR SYMMERS, M.B., Queen's College, Belfast.

Vice-Presidents: WALTER SYDNEY LAZARUS-BARLOW, M.D., Cancer Research Laboratory, Middlesex Hospital, London; ARTHUR EDWARD MOORE, M.B., Castlemaison, Blackrock, Cork; ASTLEY VAVASOUR CLARKE, M.D., 37, London Road, Leicester; Professor I. WALKER HALL, M.D., 9, Royal Park, Clifton, Bristol.

Honorary Secretaries: ALFRED EDWARD BARNES, M.B., 348, Glossop Road, Sheffield; OTTO F. F. GRÜNBAUM, M.D., 34, Wimpole Street, London, W.; WILLIAM JAMES WILSON, M.D., Pathological Laboratory, Queen's College, Belfast.

PHARMACOLOGY AND THERAPEUTICS.

President: Professor RALPH STOCKMAN, M.D., F.R.S. Edin., The University, Glasgow.

Vice-Presidents: Professor WALTER ERNEST DIXON, M.D., Pharmacological Laboratory, Cambridge; NEWMAN NEILD, M.D., 9, Richmond Hill, Clifton, Bristol.

Honorary Secretaries: VICTOR GEORGE LEOPOLD FIELDEN, M.B., 84, Dublin Road, Belfast; HECTOR CHARLES CAMERON, M.B., Guy's Hospital, London, S.E.

PSYCHOLOGICAL MEDICINE.

President: OUTTERSON WOOD, M.D., 40, Margaret Street, Cavendish Square, London.

Vice-Presidents: GEORGE ROBERT LAWLESS, F.R.C.S.I., District Asylum, Armagh; WM. RICHARD DAWSON, M.D., Farham House, Finglas, co. Dublin; ROBERT HENRY COLE, M.D., 25, Upper Berkeley Street, London, W.; MICHAEL JAMES NOLAN, L.R.C.P. and S.I., Down District Asylum, Downpatrick.

Honorary Secretaries: WALTER SAMUEL SMYTH, M.B., District Asylum, Antim; SIDNEY HERBERT CLARKE, M.B., Leicester and Rutland Asylum, Narborough, Leicester-shire.

The subjects selected for discussion are (1) Somatic Delusions and Local Lesions; (2) The Report of the Royal Commission on the Feeble-minded.

SURGERY.

President: Professor THOMAS SINCLAIR, M.D., F.R.C.S., 22, University Square, Belfast.

Vice-Presidents: CHARLES ALFRED BALLANCE, M.V.O., M.S., F.R.C.S., 106, Harley Street, W.; Sir PETER

O'CONNELL, M.D., 9, College Square North, Belfast; ARTHUR JOHN DREW, F.R.C.S., Water Hall, St. Aldate's, Oxford; JOHN GALWAY COOKE, M.B., City and County Infirmary, Londonderry; ARTHUR BROWNLOW MITCHELL, F.R.C.S.I., 18, University Square, Belfast.

Honorary Secretaries: W. TRELWALL THOMAS, F.R.C.S., 84, Rodney Street, Liverpool; G. LENTHAL CHEATLE, C.B., F.R.C.S., 117, Harley Street, London; HOWARD STEVENSON, M.B., F.R.C.S.I., 2, College Square North, Belfast; JAS. BERNARD MOORE, M.B., 11, Clifton Street, Belfast.

TROPICAL MEDICINE.

President: CHARLES WILBERFORCE DANIELS, M.B., London School of Tropical Medicine, Albert Docks, London.

Vice-Presidents: Lieutenant-Colonel ANDREW DEANE, I.M.S., Royal Victoria Hospital, Belfast; Surgeon-General W. R. BROWNE, M.D., C.I.E., 5, Royal Crescent, Holland Park Avenue, London.

Honorary Secretaries: JAMES COLVILLE, M.D., 7, University Square, Belfast; Dr. ANTON BREINL, Director Runcorn Research Laboratories.

PROVISIONAL TIME TABLE.

FRIDAY, JULY 23RD, 1909.

11 A.M.—Annual General Meeting followed by Representative Meeting.

SATURDAY, JULY 24TH, 1909.

9.30 A.M.—Representative Meeting.

MONDAY, JULY 26TH, 1909.

10 A.M.—Representative Meeting.

7.30 P.M.—Annual Conference of Secretaries of Divisions and Branches.

TUESDAY, JULY 27TH, 1909.

10 A.M.—Council Meeting.

Excursions.

Honorary Local Secretaries—

HENRY LAWRENCE MCKISACK, M.D., M.R.C.P., 17, University Square, Belfast.

CECIL EDWARD SHAW, M.A., M.D., M.Ch., 29, University Square, Belfast.

HOWARD STEVENSON, B.A., M.B., F.R.C.S.I., 2, College Square North, Belfast.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BATH AND BRISTOL BRANCH: BRISTOL DIVISION.

A MEETING of this Division was held on Tuesday, February 16th, at the Medical School, University College. In the absence of Dr. Herapath the chair was taken by the Vice-Chairman, Dr. PARKER. Nineteen members were present.

Medical Officers of Health.—In answer to the question as to whether medical officers of health should devote their whole time to the work it was resolved:

That medical officers of health should devote their whole time to the work where possible. That it be combined with security of tenure and an adequate salary.

Medical Inspection of Schools.—In the discussion upon the questions asked as to the medical inspection of school children there was some difference of opinion as to whether there should be part-time inspectors. It was resolved:

1. That this Branch approve of the principle of payment by salary based on the time devoted to the work whether the officer is a part or whole time medical man.
2. That the actual treatment of physically defective school children should not be undertaken by the medical inspectors, and the parents should be referred to their own medical attendant, who alone should decide what treatment should be given and where it is desirable that such treatment should be given. Cases having no medical attendant, or being too poor to pay for advice, should be referred to the Medical Department of the Poor Law, which should be reorganized to meet the demand for the increased medical relief which will arise.

Earlier Election of Representatives.—The rules of the Division were modified to admit of the Representative being elected nine months before the Representative Meeting.

Election of Chairman and Vice-Chairman.—Dr. C. K. C. Herapath was elected Chairman and Dr. George Parker Vice-Chairman of the Division.

BIRMINGHAM BRANCH: COVENTRY DIVISION.

THE fourth ordinary meeting of this Division was held at the Coventry and Warwickshire Hospital on February 2nd, at 8.30 p.m. In the absence of the Chairman (Dr. Harman Brown) through ill-health, Dr. RICE (Vice-Chairman), upon the proposal of Dr. ORTON, seconded by Mr. BENNETT, took the chair. There were also present Drs. Davidson, Snell, Collington, Moore, Kendrick, Lieutenant-Colonel Ward, Drs. Hadley, Pendred, Harris, Mr. Bennett, and the Honorary Secretary (Dr. J. Orton).

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Cases and Specimens.—Mr. W. E. BENNETT showed three specimens of ovarian tumour—one of ruptured, one twisted, and one dermoid. He described clinical symptoms relative to each case. A discussion ensued, and upon the proposal of Dr. DAVIDSON, seconded by Dr. KENDRICK, a hearty vote of thanks was passed to Mr. Bennett for his interesting cases and specimens.

Payment for School Certificates.—The matter of payment for school certificates was brought forward by the SECRETARY and discussed by Drs. HADLEY, SNELL, and MOORE. Dr. Moore proposed:

That every medical practitioner in the area of the Division should be paid for each certificate of unfitness for school.

Dr. ORTON seconded. Dr. KENDRICK proposed as an amendment:

That the matter be postponed till the next meeting.

Dr. DAVIDSON seconded, and the amendment was carried.

Paper Postponed.—Upon the proposal of Dr. DAVIDSON, seconded by Dr. PENDRED, Dr. Milner Moore's paper was postponed till the next meeting.

GLOUCESTERSHIRE BRANCH.

A SPECIAL meeting of the Branch was held at the Cheltenham General Hospital on February 11th, at 5.30 p.m., the PRESIDENT in the chair. Twenty members were present.

Election of Representative in Representative Meetings.—It was proposed by the PRESIDENT, seconded by Dr. SOUTAR, and carried, that the words in Rule 5, namely,

Held not more than three months nor less than three weeks,

should be altered so that the rule should read:

5. The Representative of the Division in Representative Meetings of the Association shall be elected in the manner prescribed in Article XXVII:

XXVII. . . . In the case of a Constituency formed within the United Kingdom, the Representative shall be elected by a General Meeting of Members of the Constituency, held not more than nine months, nor less than three weeks, before the Annual Representative Meeting. . . . Such Meeting shall be convened . . . by the Secretary of the Constituency, who, in the case of a Constituency composed of more than one Division shall be chosen by the Secretaries of those Divisions, and, if they cannot agree, by the Council. The Secretary of each Constituency shall inform, not less than fourteen days before the Representative Meeting, the General Secretary of the name and address of the Representative elected by such Constituency, and the General Secretary shall issue to such Representative a ticket of admission to the Meeting.

And that Clause *b* in Rule 10, namely,

To elect the Representatives of Divisions in Representative Meetings of Association,

be omitted.

Medical Inspection of School Children.—A discussion then followed on the questions asked by the Medico-Political Committee regarding some points arising in connexion with medical inspection of school children and the treatment of those found defective. It was proposed by Dr. SOUTAR, seconded by Mr. BUCKELL, that

A State school medical service be established.

Dr. BRAINE-HARTNELL proposed as an amendment, and Dr. COX seconded:

That cases of illness be referred to the ordinary medical attendant.

Mr. CUTBERT proposed, and Dr. MEYRICK-JONES seconded, that the discussion be adjourned to a future meeting. Both amendments were lost, and the original proposal carried by 11 to 2. It was proposed by Dr. H. BRAMWELL, seconded by Mr. CUTBERT, and carried:

That this Branch strongly disapproves of existing charities, such as general or special hospitals or institutions supported by voluntary contributions, being primarily utilized for treatment of elementary school children.

A general meeting of the Branch was held at Stroud Hospital on February 18th, at 6.30 p.m., the PRESIDENT in the chair, and 32 members present.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Apologies for Absence.—Apologies for absence were read from Drs. Batten, Bramwell, and Dent.

Chronic Diarrhoea.—Dr. ROBERT HUTCHISON, of London, gave an address on chronic diarrhoea, its varieties and treatment. He began by stating that diarrhoea might consist in an increase in the amount of the stools, as well as in their frequency or in their abnormal fluidity. The best example of the first was found in forms of diarrhoea met with in children between 1 and 3 years of age. He described the large, pale, offensive stools of these cases, and the good results of treatment with silver nitrate, gr. 4 doses, and then went on to chronic diarrhoea, characterized by an increase in number of motions, or by their abnormal fluidity, and classified them as follows: 1. Disease of the stomach, producing "gastric" diarrhoea, and its treatment by hydrochloric acid. 2. Disease of small intestine—"enteritis," alcoholism, and phthisis being common causes. 3. Diseases of colon—(a) chronic catarrhal colitis, (b) ulcerative colitis, (c) chronic dysentery, (d) malignant disease, (e) sigmoiditis—drawing attention to the use of colon irrigation with silver salts in chronic catarrhal colitis, of appendicectomy in ulcerative colitis, and the importance of not overlooking malignant disease as a cause of diarrhoea. 4. Nervous

irritability of intestine—(a) "nervous" diarrhoea, treated best by bromide; (b) lenteric diarrhoea, treated by small doses of opium before meals. He mentioned the frequency of a catarrhal basis in these forms and concluded with some remarks on the importance of examining the stomach contents, and of sigmoidoscopy in all cases of chronic diarrhoea. An interesting discussion followed by the President, and Messrs. OSCAR CLARK, PRUEN, CUTBERT, MARSHALL, DAVIES, MARTIN, AFFLECK, BRAINE-HARTNELL, COODE, FINLAY and SOUTAR, all of whom thanked Dr. HUTCHISON for his address, after which Dr. HUTCHISON replied.

Dinner.—Twenty nine sat down to dinner at the Stroud Club.

LEINSTER BRANCH.

The annual general meeting of the Branch was held in the Royal College of Physicians, Dublin, on February 13th, Dr. BOYCE, President, in the chair.

Report of Honorary Secretary.—Professor WHITE, Honorary Secretary, stated that the membership numbered 302, and there was a balance of £25 in hand. On the motion of Dr. FALKNER, seconded by Dr. CRAIG, the report was adopted.

Election of Officers.—The following appointments for the ensuing year were then announced: President, F. W. KIDD, M.D.; President-elect, Sir William Smyly, M.D.; Vice-Presidents, Sir Arthur Chance, F.R.C.S., and H. T. Bewley, M.D.; Representatives on Irish Committee, James Craig, M.D., and J. M. S. Kenny, M.B.; Honorary Secretary and Treasurer, Professor White (Royal College of Surgeons, Dublin).

The Referendum.—A resolution was adopted that a Referendum of the British Medical Association should be taken on a requisition of a half, and not two-thirds, of the Council, as required at present.

Vote of Thanks to Retiring President.—A vote of thanks to the outgoing President was proposed by the President of the Royal College of Physicians, seconded by Dr. VERNES FURLONG, and unanimously adopted.

New President's Address.—Dr. FRED. KIDD then delivered his address, in the course of which he said that, owing to the disabilities, hardships, and grievances connected with the Poor Law and dispensary services, the better type of candidates and the best educated among them did not, as a rule, seek for appointments in these services in the rural districts, and the working of the Public Health Acts suffered from the conditions under which the medical officers were appointed, and under which they carried out their duties. He referred to the investigations into the Poor Law medical system made by Sir William Thomson and Surgeon-General EVATT, and to the efforts of the Irish Medical Association to get the doctors to combine on the questions of salary and holidays, and said that had there been more *esprit de corps* amongst the members of the profession at that time they could have enforced their demands. More than 50 out of the 159 unions had adopted the scale of the Irish Medical Association, and about 400 dispensary officers had benefited thereby. The amount of increase of salaries totted up to £12,000 a year, and about £3,000 a year for the payment of substitutes when the officers were on vacation. Within the last ten years the Irish Medical Association had spent nearly £1,400 in law costs on behalf of its members. Referring to the reports of the Commission on the Reform of the Poor Law, the President said the Government was supposed to be at present framing legislation based upon these reports, and it behooved the medical profession to be on the alert, and to make itself acquainted with what was being done at as early a date as possible, so as to be able in some way to influence the course of the coming reform. One of the greatest difficulties they had to contend with in getting their grievances redressed was the want of *esprit de corps*, and he thought their profession might learn a lesson from the study of the tactics adopted by some of the trades unions. There were many ways in which members of the public made inroads into the profits which should legitimately come to the members of the medical profession. One had only to study the daily press to notice the overwhelming increase in the number of advertisements of nostrums and quack medicines. The General Medical Council, recognizing the great injury done to the public and to the profession by the

sale of quack medicines and nostrums, had collected evidence as to the laws and regulations and methods adopted in other countries in dealing with quacks and their preparations, and he had every hope that this evidence might be utilized to enable the Council to get extended powers, so that they might be able either to deal with the question themselves or to bring such pressure to bear on the Government that wholesome legislation might follow. Referring to food preparations, he said the extremes to which some experts may go in the adulteration of food was amazing. Within the last week a firm was fined £20 for supplying a cattle food purporting to be a mixture of husks of rice and oats, but which on analysis was found to be composed of 62½ per cent. of sawdust and 37½ per cent. of plaster of Paris. (Laughter.) Having dealt with the antituberculosis campaign, the registration of nurses, the establishment of the branch of the Research Defence Association in Dublin, the President said other questions that were of great importance were the increase of insanity, the increase of cancer, and the falling birth-rate, all of them accompanied by a diminishing consumption of alcohol. What the future of the country doctor was to be he did not know. The outlook was far from cheery. However, there was a prospect of some reform, and let it be an opportunity for all working together for the common weal.

Registration of Nurses.—A resolution was passed that the Branch did not approve of any Nurses' Registration Bill that did not contain clauses that the bill apply to Ireland or that did not make it clear that the registration did not qualify nurses to practise medicine.

METROPOLITAN COUNTIES BRANCH:

KENSINGTON DIVISION.

The late Mr. George Eastes.—At a meeting of the Executive Committee of this Division, the CHAIRMAN (Dr. Rice Oxley), Dr. CRAWFORD THOMSON, and others spoke eulogistically and sympathetically of the late Mr. George Eastes, both personally and in his relationship to the Association and profession. It was resolved to request the Chairman and Secretary to write a letter of condolence and sympathy to his relatives.

WESTMINSTER DIVISION.

An ordinary meeting of the Westminster Division of the Association was held on February 4th at the Criterion Restaurant, Dr. WILLIAM EWART, President, in the chair.

Dinner.—The meeting was preceded by a dinner, at which twenty members and guests were present, six other members joining the meeting later.

Ordinary Business of the Division.—(1) Minutes; (2) correspondence; (3) report from Medical Secretary.

Importance of Early Diagnosis with a View to Successful Treatment.—Mr. A. W. MAYO ROBSON, F.R.C.S., opened the discussion upon this important question in an address which was published in the BRITISH MEDICAL JOURNAL of February 20th, p. 451. Mr. C. B. KEETLEY, in discussing the paper, gave many important reasons in favour of the views advanced by Mr. Mayo Robson, and urged the importance of early consultations between physicians and surgeons. Mr. URBAN PRITCHARD said the subject of Mr. Mayo Robson's paper had a special interest to the otologist, on account of the great importance of early diagnosis in cases of middle-ear suppuration and its very serious intracranial complications. The early diagnosis of the suppuration was not difficult, for in a doubtful case, even without a speculum, a cotton-wool mop introduced gently down to the bottom of the meatus would at once discover any discharge; and yet, he was sorry to say, there were still frequently met with cases of intracranial disease from middle-ear suppuration which had not been noticed until the case was hopeless. Some little time ago he was caught returning late from a country journey, and taken across London to see a young lady dying of meningitis from ear disease which had only been diagnosed a few hours. If that case had been diagnosed and taken in hand, say, two months earlier, the life would have been saved. Mr. CRESSWELL BABER drew attention to the importance of early diagnosis for successful surgical treatment in (1) malignant disease of the upper jaw in which rhinospicy and transillumination were important aids; (2) malignant intralaryngeal growths, the early recognition of which by

the practitioner by means of the laryngoscope was of extreme importance for treatment; (3) intracranial complications of suppurative middle-ear disease. He also urged the importance of the recognition and treatment of acute ear disease, even when slight, in the exanthemata, and was of opinion that the timely performance of Schwartz's operation in these cases, when the antrum was clearly affected, would help to prevent subsequent long-continued middle-ear suppuration and the necessity later on for a radical mastoid operation. He considered Mr. Mayo Robson's remarks very valuable and important. Mr. J. HOWELL EVANS, upholding the great importance of early diagnosis in the curative treatment of cancer, gave a very interesting demonstration of (a) the cystoscope and ureteric catheter; (b) the gastro-duodenoscope, with catheterization of the biliary and pancreatic passages, in which he pointed out the value of such instruments when properly employed and aided by skiagraphy. Mr. Howell Evans testified to the great value of the gastro-duodenoscope in the early diagnosis of carcinoma of the stomach, even when digital palpation of this organ through a laparotomy wound failed to reveal any early lesion. Drs. ARCHER and FINCANE referred to (1) the great difficulty in getting parents to attend in any satisfactory manner to the syringing of their children's ears; (2) how earache seemed to be considered as a necessary trivial ailment which every child should experience; (3) how all home remedies were in such cases invariably exhausted before the practitioner's advice was sought; whereas the inadequate instruction to hospital patients to "go home and keep the ears clean" had led to grave neglect for one, two, or more weeks—even months—for which oftentimes the general practitioner had been wrongly accused when at length graver lesions presented themselves. Dr. DAUBER remarked that there was one point—namely, oral sepsis—to which neither Mr. Mayo Robson nor the previous speakers had made allusion, but which appeared to him of great importance as a causative factor in many of the pathological conditions of the alimentary system. Emphasis had been placed, in the paper to which they had just had the pleasure of listening, upon the importance of radical rather than merely palliative measures in the early stages of such conditions as appendicitis, duodenal ulcer, and cholelithiasis. With this view he was in entire concurrence; but his experience led him to believe that very often these pathological processes were secondary to oral sepsis, and would not be so frequently seen, even if they could not be entirely prevented, if the buccal cavity and fauces were habitually kept in a wholesome aseptic state. No one who was not in the habit of inspecting the mouths of hospital patients would credit the appalling conditions which prevailed amongst the out-patient class. Edentulous gums, septic stumps, carious molars, incrustations of sordes, various degrees of pyorrhoea alveolaris—one or other of these conditions was the argument amongst his own out-patients at the Hospital for Women rather than the exception; and many patients who came or were sent to the hospital on the assumption that they were suffering from pelvic disease were found to be suffering instead from some disordered condition of one or other part of the alimentary canal, or else to be the subjects of marasmus, malnutrition, toxæmia or constitutional disturbance dependent upon the foul and septic condition of their mouths. To the same cause he would attribute most of the cases of middle-ear disease, by direct infection along the Eustachian tube, to which Dr. Pritchard had alluded. He believed that at the present time, in the treatment of scarlet fever, not the least important duty of the nurse was to keep the mouth clean, in order to save the patient both from otitis media and cervical glandular infection. Personally he felt that the whole question of oral sepsis and its relation to other diseases, from otitis media to ulcerative colitis, needed "booming"—so wide and far-reaching were its effects—and not being a dental surgeon himself he felt he could say this without bias or partiality. With regard to the importance of dealing with ovarian tumours in their earlier stages, to which Mr. Mayo Robson had made reference, he must say that he did not think they saw anything like the number of the larger cystomata that they met with some ten years ago—indeed it was rather a complaint with his colleagues and himself that the ground, so to speak, was too much shot over and that little was left, and that

of no size, to operate upon. With respect to uterine fibroids he did not think this was so much the case. These tumours, he thought, were hardly yet taken quite seriously enough in this country. Even in the Obstetrical Society, that august but somewhat conservative assembly, they did not seem to him to view fibroid disease as one that should be nipped, surgically, in the bud, but rather as one that should mature, under observation, until ripe for attack. No one had done more to emphasize the importance of the radical treatment of uterine fibroids than had Mr. Bland-Sutton, and he himself shared that surgeon's views and followed his practice. He agreed with Mr. Howell Evans that the frequent absence of pain when cancer attacked the uterus was an unfortunate circumstance, detrimental to the interests both of the patients and of surgery itself, for the suspicions of patients were not aroused, in innumerable cases, until too late. That women should be induced to submit to local examination as soon as their attention was attracted to any abnormal discharge or other unusual condition was, he considered, the chief desideratum in order to combat these sad cases sufficiently early.

NORTH OF ENGLAND BRANCH:

SUNDERLAND DIVISION.

A SCIENTIFIC meeting (the fourth of the winter session) of the Division was held at Sunderland Infirmary on Tuesday, February 9th. Fifty-one members out of a total of eighty-eight were present. The following cases and pathological specimens were shown:

Cases.—Dr. MORGAN: (1) Perforated gastric ulcer. (2) Suprapubic lithotomy. (3) Strangulated inguinal hernia in which the bowel sloughed; short-circuiting was performed by a Murphy's button. (4) A freak. Dr. HORGON: (1) Naevus of cheek; a question of treatment. (2) Two cases for diagnosis, male and female. (3) Double Erb's paralysis. Dr. BLUMER: (1) Cholechochotomy. (2) Congenital dislocation of the shoulder. Dr. ROBINSON: (1) Depressed fracture of frontal bone. (2) Depressed fracture of skull, which was elevated. (3) Acute epiphysitis with resection of bone. (4) Nephrorrhaphy. Dr. WELFORD: A case of enlarged spleen. Dr. BRUCE LOW: (1) Subacute myelitis. (2) Cerebral tumour. (3) Two cases of amyotrophic lateral sclerosis. (4) Hodgkin's disease. Dr. GEORGE MORGAN: (1) Paralysis agitans. (2) Aphasia. (3) Thoracic aneurysm. (4) Abdominal aneurysm. Dr. CHALMERS: (1) Two cardiac cases, mother and child. (2) Infantile paralysis. (3) Case for diagnosis.

X-ray Cases.—The following were also shown: Three cases of rodent ulcer. A case of Hodgkin's disease.

Pathological Specimens.—The following were exhibited: (1) An old perforated gastric ulcer, showing the silk suture. (1a) Strangulated hernia due to a band of adhesions secondary to the perforated ulcer. (2) A curiously contracted stomach, probably secondary to chronic ulceration. (3) Surgical kidneys and cystitis of bladder secondary to malignant prostate, both structures showing secondary deposits. (4) Aneurysm of innominate artery. (5) Thoracic aneurysm. (6) Fibroid of uterus. (7) Intussusception. (8) Ditto. (9) Papilloma of larynx. (10) Tuberculous nodule in cerebellum. (11) Congenital heart disease. (12) Carcinoma of splenic flexure removed during life. (13) Specimens of intestinal obstruction. (14) Hypertrophic elongation of cervix. (15) Twin monstrosity.

A Discussion took place on the cases and specimens as shown.

Demonstration.—Dr. T. COKE SQUANCE gave a lantern micro-demonstration of sections of sarcoma.

Vote of Thanks.—A vote of thanks was proposed to the honorary members of the staff and to the resident staff.

Refreshments.—The Matron (Sister Mary), with her usual kindness and generosity, provided light refreshments.

SOUTH-EASTERN BRANCH:

FOLKESTONE DIVISION.

A MEETING of this Division was held on Saturday, February 13th, at Hotel Wampach, at 8.15 p.m. Dr. D. FITZGERALD, Chairman of the Division, presided.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Letter.—A letter was read from Dr. H. HICK, Medical Officer of Health for New Romney.

Medical Officers of Health.—It was proposed by Dr. CHAMBERS, and seconded by Dr. MENZIES, and carried unanimously:

That the Folkestone Division expresses its opinion that medical officers of health should be debarred from engaging in private practice, but that existing medical officers of health should, where possible, retain their appointments, and should receive adequate compensation for the loss of private practice; also, that their tenure of office should be secure.

Medical Inspection of School Children.—It was unanimously resolved that the Division (1) approves of payment per head for part-time officers with a minimum fee of 2s. 6d., and that extra work, reports, etc., be paid for. (2) Treatment: The Division unanimously agrees with the proposition of the Watford and Harrow Division.

Police Emergency Fees in Kent.—A letter was read from the Secretary of the South-Eastern Branch, stating that:

The subcommittee of the Branch Council appointed to consider the question of police fees is to remain a standing subcommittee, and, in the event of a case occurring in which it seemed desirable to take legal advice, that this subcommittee should add to their number the secretary of the Division in which the case occurred, and should then have power to consult the solicitor of the Association, and take action if so advised.

Division of the South-Eastern Branch.—This Division does not think it advisable to divide the South-Eastern Branch.

ISLE OF THANET DIVISION.

The thirtieth meeting of this Division was held at the Granville Hotel, Ramsgate, on Thursday, February 18th. There were present eighteen members and two visitors.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed and signed.

Proposed Division of Branch.—A letter was read from the Honorary Secretary of the South-Eastern Branch re police emergency fees and enclosing a question with regard to the division of the Branch, while a letter was also read from the Honorary Secretary of the Brighton Division on the same question. After some discussion it was proposed by Dr. HALSTEAD and seconded by Dr. WATTS that the proposal for dividing the Branch into two by a line, meaning North and South, be supported, while the suggestion of the Council of separating the South London area into the Metropolitan Counties Branch be also supported. This was carried unanimously.

Paper.—Dr. ARTHUR LATHAM read a paper on the administration of tuberculin. He illustrated the paper with diagrams of charts of various cases.

Vote of Thanks.—A vote of thanks was heartily passed to Dr. Latham for his paper and to Dr. Tamplin for presiding.

SOUTHERN BRANCH:

JERSEY DIVISION.

A MEETING of this Division was held on February 12th at the Secretary's private residence; six members were present.

The Work of the Association.

After routine business had been transacted, Dr. J. F. CARRUTHERS, of Guernsey, Representative for the Channel Islands, gave an address on some recent developments in the British Medical Association, in the course of which he described the constitution before 1902, and the new constitution then adopted. In the second part of his address he discussed the change which, he held, had revolutionized the relations between the medical profession and public corporate bodies, and called urgently for the complete organization of the profession. Thirty years ago, he said, speaking quite broadly, there were no registered midwives, no district nurses, no medical officers of health, no school medical officers, comparatively little abuse of hospital and dispensary out-patient departments, comparatively little club and contract practice, and no juveniles. The practitioner who had an adult male club had the family practice as a set-off. The money to pay for all these new developments had come out of the pockets of the general practitioner. Everybody had his peck at him. Hospitals, dispensaries, dispensing chemists, bone-setters, midwives, trained nurses, public vaccinators,

school medical officers, medical officers of health. Boards of guardians ground him down; friendly societies threatened him with youthful medicos if he kicked at their sweating terms. He had a cut-throat competition with his neighbours. He hardly dared to take a holiday through dread of the cost of a locum-tenent. The night-bell ruined his nights; the telephone destroyed his days. Everybody expected cash from him; nobody paid it. It was a dog's life, but how it could be improved by properly organized combination! But it was just the general practitioner who would not combine—he to whom of all men combination meant salvation. He would not presume to suggest rules of conduct for consultants; and the man with a sixpenny dispensary might find them an embarrassment. But organization alone would save the general practitioner from extinction. No class of man knew better than medical men that unity was strength. No class more lamentably failed to obtain it. No attempt could be made to deal firmly with any public body, with any club, with their own black sheep, without feeling that one of their own household would cut in and stultify all their work. It was here that the reforming party of the British Medical Association stepped in, believing that the Association offered means—the only means—by which unity could be obtained. They were advised that a society with compulsory universal membership was impossible: what substitute existed? Here was the largest voluntary medical society in the world. Socially, it contained the best-known and most influential medical men in the three kingdoms. Its name was well known and respected. It owned an important journal. It had a strong financial position, and valuable central premises in the Strand. The question the reformers asked themselves was: Can the British Medical Association be developed into a force that will be of such material benefit to its members that no medical man can afford to stand out of it? At the outset it was discovered that as a company registered under the Companies' Acts the Association was debarred from using its funds for mutual assistance, for schemes of benevolence, for mutual defence against malicious charges or oppression by public bodies. Equally was it debarred from assisting sick members, or supporting the widows and orphans of members who have died in financial difficulties. Counsel advised application to the Privy Council for a Royal Charter, under which those schemes could be undertaken. Keen sympathy in this endeavour was shown by the Colonies, and Australia, South Africa, and Canada had expressed their wish for the new Charter. But if you, gentlemen, he continued, do not look upon mutual defence, mutual assistance, old age pensions, sick benefits, and such like as worthy objects for our Association to take up, you will have no sympathy with my views. I consider it a disgrace to the profession that that pitiful page should exist in the JOURNAL and the LANCET, where we read of £1 here and £2 there being doled out to the widow and orphans of some dead M.D. or L.R.C.P. I consider it a disgrace that practitioners should be left to pay out of their own pockets for their fight against unfair conditions on behalf of the whole profession. I consider it a disgrace that a British working man, who sits education-free and income-tax free, and travels half price on rail and tram, and who can spend an average of 5s. a week on beer and football matches, should be allowed to get off with a penny a week for himself and a halfpenny a week for his child to the club doctor. If it were possible to have a universally compulsory medical society, such as, I believe, the legal profession has in the Law Society, our troubles would soon be at an end. We were, however, advised that this was impossible. The only alternative was to make membership of the British Medical Association so advantageous that no member of the profession could afford either to stand outside, or to forfeit his membership once he was inside. And the question before us is how best to do this. I have been amazed at the amount of time and work given freely for this object by busy men like Sir Victor Horsley, Andrew Clark, J. A. Macdonald, H. A. Ballance, H. W. Armit, and dozens of others whose very names are unknown to 95 per cent. of the men they are working for. Let us look the facts in the face. When we are dealing with private patients we deal as individuals with individuals. But when medical men have to deal with public bodies,

Government departments, boards of guardians, working men's societies, then invariably we fail, because we are not organized, because we do not combine. It is known that over 25 per cent. of the profession are earning less than £200 a year. A man struggling for the bare necessities of life has no time to be noble or dignified. If he has hungry children to feed, and if he knows that by asking 3s. 6d. instead of the agreed 4s. he will get a club of 700 or 800 members, he will ask 3s. 6d., unless we have a force powerful enough to prevent him. Can we find the force? Can we make the British Medical Association into that force? That is the question before us. My own belief is that only by sick benefits, mutual insurance, mutual defence, old age pensions, allowances for widows and orphans, shall we offer inducements strong enough to bring the whole profession into our ranks.

Paper.—A paper was also contributed by the CHAIRMAN (Dr. H. C. Major) on the treatment of intracranial tumours.

Nabal and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

FLEET SURGEON C. W. SHARPLES has been placed on the retired list with the rank of Deputy Inspector-General of Hospitals and Fleet, February 17th. The commissions are thus dated: Surgeon, August 25th, 1881; Staff Surgeon, August 25th, 1893; Fleet Surgeon, August 26th, 1897.

The following appointments have been made at the Admiralty: Staff Surgeon J. A. L. CAMPBELL and Surgeon J. H. VINCIGUT, M.B., to the *Aboukir*, on recommissioning, March 2nd; Staff Surgeon J. R. MITCHELL, M.B., and Surgeon D. P. CHAPMAN, to the *President*, additional, for the *Maine*, undated; Surgeon E. S. WILKINSON, M.B., to the *Wildfire*, additional, for disposal, February 15th; Surgeon P. T. NICHOLS, to the *Excellent*, undated; Fleet Surgeon P. M. MAY, to the *Goliath*, February 15th; Staff Surgeon E. S. TUCK, to the *Hannibal*, February 15th; Staff Surgeon R. WATERFIELD, to the *Sapphire*, additional, for the *Tyne*, February 22nd; Surgeon S. AUSTIN, M.B., to the *Victory*, for temporary service, to date on joining; Staff Surgeon M. CAMERON, M.B., to the *Crescent*, temporary, undated.

ROYAL NAVAL VOLUNTEER RESERVE.

SURGEON H. LEITH MURRAY has been appointed Surgeon in the Royal Naval Volunteer Reserve, and attached to the Mersey Division, February 15th.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

The undermentioned are to be Lieutenants, on probation, dated January 30th, 1909: HARRY SHERWOOD RANKIN, M.B., JOHN ALEXANDER MANFOLD, M.B., PERCY STANLEY TOMLINSON, WILLIAM HENRY O'BRIEN, CHARLES THORNTON VERR BENSON, WILLIAM PORTER MCCARTHY, M.B., ERNEST CHARLES LAMBRIN, M.B., ALFRED WILLIAM BEVIS, FRANCIS WILLIAM MURRAY CUNNINGHAM, M.B., EUSTACE MACARTNEY PARSONS-SMITH, OSWALD WILLIAM MCKINNEY, M.B., SAMUEL SELDMON DYES, M.B., JAMES JOSEPH DILLON ROCHI, M.B., ROBERT HENRY NOLAN, ROBERT CECIL PRIEST, M.B., MICHAEL WHITE, M.B., ROBERT COLIN FARIS, PHILIP GORDON MOSH ELVERY, HERBERT FLETCHER JOYNT, M.B., MARGUERITE JOSEPH WILLIAMSON, M.B., ALEXANDER STUART MONCK WINDER, M.B., WILLIAM MATHIESON, JAMES RUSSELL YOUNG, M.B., JAMES ROWLAND HILL, M.B., CHARLES LEOPOLD FRANKLIN, M.B., HARRY RUSSELL EDWARDS, ALEXANDER DICERSON STIRLING, M.B., WILLIAM BENSON RENNIE, M.B., JOHN BECKETON, and GEORGE FRITCHARD TAYLOR, M.B.

Lieutenant-Colonel S. G. ALLEN has been appointed a Medical Officer, London Recruiting Area.

Lieutenant A. G. CUMMINS is seconded for service with the Egyptian army, January 21st.

INDIAN MEDICAL SERVICE.

Lieutenant-Colonel H. W. STEVENSON, Bombay, is promoted to be Surgeon-General from January 11th. As announced in the *BRITISH MEDICAL JOURNAL* of February 13th, he has been appointed Surgeon-General with the Government of Bombay.

Colonel J. McCLOUGHY, Bombay, Principal Medical Officer, Abbottabad Brigade, is permitted to retire from the service, from January 13th. He joined the Bombay Medical Department as Assistant Surgeon, March 31st, 1875, and was made Colonel June 20th, 1905. He served in the Afghan war in 1878-80, receiving a medal.

ROYAL ARMY MEDICAL CORPS (VOLUNTEERS).

CAPTAIN AND HONORARY MAJOR (Honorary Captain in the Army) MOWBRAY TAYLOR, M.B., resigns his commission, retaining his rank and uniform, March 31st, 1908.

TERRITORIAL FORCE.

INFANTRY.

SURGEON-LIEUTENANT-COLONEL AND HONORARY SURGEON-COLONEL C. W. THORP, 6th Battalion the Lancashire Fusiliers, resigns his commission, January 12th; he retains his rank and uniform.

Surgeon-Lieutenant-Colonel H. J. FADDEY, M.D., and Surgeon-

Captain E. C. SEACK, from the 2nd Volunteer Battalion, are appointed to the 6th Battalion the Prince of Wales's (North Staffordshire Regiment), with rank and precedence as in the Volunteer Force, April 1st, 1908.

ROYAL ARMY MEDICAL CORPS.

Highland Mounted Brigade Field Ambulance.—Lieutenant J. W. MACKENZIE, M.D., to be Captain, January 23rd.

Third London (City of London) Field Ambulance.—Lieutenant H. C. PHILLIPS to be Captain, January 30th.

Second London Field Ambulance.—The promotion of Captain P. F. SHAW to the rank of Major bears date April 1st, 1908, and not December 13th, 1908, as stated in the *London Gazette* of January 19th, 1909. Captain J. McKIE, M.B., to be Major, April 1st, 1908.

Fourth Northern General Hospital.—Captain D. J. G. WATKINS, M.B., to be Major, November 3rd, 1908.

Eastern Mounted Brigade Ambulance.—Lieutenant G. S. WILKINSON, from the Hertfordshire Battalion the Bedfordshire Regiment, resigns his substantive rank on appointment as Transport Officer, with the honorary rank of Lieutenant, November 23rd, 1908. WILLIAM SMITH to be Lieutenant, December 10th, 1908.

South Wales Mounted Brigade Field Ambulance.—Lieutenant-Colonel F. H. THOMPSON resigns his commission, with permission to retain his rank and to wear the prescribed uniform, February 24th.

First West Lancashire Field Ambulance.—The undermentioned officers are transferred from the 2nd West Lancashire Field Ambulance, dated January 1st: Lieutenant F. W. K. TOWSE, F.R.C.S. Edin., to be Lieutenant; Lieutenant A. P. H. SIMPSON to be Lieutenant.

Second West Lancashire Field Ambulance.—The undermentioned officers are transferred from the 1st West Lancashire Field Ambulance, January 1st: Lieutenant WILLIAM MACDONALD, M.B., to be Lieutenant; Lieutenant C. L. WILLIAMSON to be Lieutenant.

First London Field Ambulance.—The undermentioned Captains to be Majors, dated April 1st, 1908: G. H. EDINGTON, M.D.; ARCHIBALD YOUNG, M.B.

Second Northern General Hospital.—EDMOND F. TREVELYAN, M.D., to be Lieutenant-Colonel, December 14th, 1908. Major CHARLES BOTCH, M.D., to be Lieutenant-Colonel as from October 28th, 1907, dated April 1st, 1908. Lieutenant G. H. LEWIS resigns his commission, December 14th, 1908.

For attachment to Units other than Medical Units.—Captain J. KYFFIN, from the 2nd Western General Hospital, to be Captain, June 25th, 1908. Lieutenant C. A. SPOONER to be Captain, December 4th, 1908. ALEXANDER DICK to be Lieutenant, dated December 2nd, 1908. Lieutenant A. H. GOSWAMI, from the 2nd West Lancashire Field Ambulance, to be Lieutenant, January 1st. Lieutenant L. C. V. HARDWICK to be Captain, January 22nd.

CHANGES OF STATIONS.

The following changes of stations amongst the officers of the Army Medical Service have been officially reported to have taken place during January:

	FROM	TO
Colonel P. M. Ellis	Quetta	Lucknow.
" O. E. P. Lloyd, V.C.	Ranket	Meerut.
" O. Todd, M.B.	Ootacamund	Bangalore.
" R. Jennings, M.D.	Cosham	Sevonport.
Lieut.-Col. H. L. E. White	Woolwich	Crete.

" P. S. O'Reilly	India.	

Vital Statistics.

THE REGISTRAR-GENERAL'S QUARTERLY RETURN.

[SPECIALLY REPORTED FOR THE BRITISH MEDICAL JOURNAL.]

THE REGISTRAR-GENERAL has just issued his return relating to the births and deaths in the fourth quarter of last year, and to the marriages during the three months ending September last. The marriage-rate during that period was equal to 16.6 per 1,000 of the total population, and was 0.7 per 1,000 below the average rate in the corresponding quarters of the ten preceding years.

The births registered in England and Wales during the three months under notice numbered 221,438, and were equal to an annual rate of 24.6 per 1,000 of the population, estimated at 55,348,760 persons in the middle of last year; the average rate in the ten preceding fourth quarters was 27.0 per 1,000. The birth-rates in the several counties last quarter ranged from 18.4 in Sussex, 18.9 in Herefordshire, 19.4 in Cambridgeshire, 20.1 in Northamptonshire, 20.2 in Shropshire, and 20.5 in Gloucestershire, to 26.6 in Wiltshire, 26.9 in Northumberland, 29.0 in the North Riding of Yorkshire, 29.9 in Carmarthenshire, 32.0 in Durham, 33.2 in Glamorganshire, and 31.7 in Monmouthshire. In seventy-six of the largest towns, including London, the birth-rate averaged 25.0 per 1,000; in London the rate was 33.5 per 1,000, while it averaged 25.6 in the seventy-five other large towns, and ranged from 15.4 in Hastings, 14.9 in Hornsey, 16.5 in Bournemouth, 17.6 in Halifax, 19.0 in Bradford, and 19.1 in Reading, to 31.9 in Swansea, 32.0 in Tyne-mouth, 32.3 in St. Helens, 32.9 in Middlesbrough, 33.4 in Merthyr Tydfil, and 39.3 in Rhondda.

The excess of births over deaths during the quarter was 91,156, against 91,533, 89,765, and 89,614 in the corresponding quarters of the three preceding years. From returns received from the Registrar-General it appears that the passenger movement between the United Kingdom and places outside Europe resulted in a net balance outward of 18,961 persons. There was an outward balance of 15,101 English, 192 Welsh, 3,223 Scotch, and 3,015 Irish, and an inward balance of 1,418 British Colonial passengers and of 1,112 foreigners.

During the fourth quarter of last year the deaths of 130,282 persons were registered, equal to an annual rate of 14.5 per 1,000 living, or 1.7 per 1,000 below the mean rate in the ten preceding fourth quarters. The lowest county death-rates last quarter were 11.0 in Northamptonshire, 11.4 in Berkshire, 11.6 in Essex and in Wiltshire, 11.9 in Sussex and in Dorsetshire, and 12.0 in Buckinghamshire and in Somersetshire; the highest were 16.5 in Kent, 16.6 in Gloucestershire, 17.0 in the Shire, 17.3 in Monmouthshire, 17.5 in the North Riding of Yorkshire, 17.6 in Durham, and 17.9 in Northumberland. In seventy-six of the largest English towns, with an aggregate population estimated at upwards of 16 millions, the corrected death-rate averaged 17.7 per 1,000; the highest was 20.4 in London, and the lowest was 15.4 in the county of 142 smaller towns, containing a population of nearly 5 millions, the rate averaged 14.7 per 1,000; while in the remainder of the county it was 13.5 per 1,000. The rate of mortality in London was 13.7 per 1,000, while among the seventy-five other large towns it ranged, from 7.6 in Bournemouth, 8.9 in King's Norton, 9.1 in East Ham, 9.5 in Leyton, 9.8 in Handsworth (Staffs), and 9.9 in Hastings, to 19.0 in Stockport, 19.1 in Rotherham, 19.2 in Rochdale, 19.5 in Preston, 19.8 in Oldham, 20.4 in Tynemouth, and 21.9 in Middlesbrough.

The 282 deaths from all causes in England and Wales last quarter included 11,550 which were referred to the principal infectious diseases; of these, 4,689 resulted from diarrhoea, 2,172 from measles, 1,686 from diphtheria, 1,257 from whooping-cough, 994 from fever (principally enteric), and 722 from scarlet fever, but not any from small-pox. The aggregate mortality from these diseases was equal to 1.28 per 1,000, or 0.24 per 1,000 below the average rate in the ten preceding fourth quarters; the mortality from diarrhoea exceeded the average, but that from each of the other diseases showed a decline.

The rate of infant mortality, measured by the proportion of deaths among children under one year of age to registered births, was equal to 139 per 1,000, the average rate in the corresponding quarters of the ten preceding years being 141 per 1,000. Among the several counties the rates of infant mortality last quarter ranged from 49 in Herefordshire, 78 in Dorsetshire, 80 in Oxfordshire, 83 in Wiltshire and in Northamptonshire, and 84 in Somersetshire, to 165 in the North Riding of Yorkshire, 166 in North Lancashire, 167 in North Yorkshire, 168 in Lancashire, 171 in Lancashire, 182 in Northumberland, and 188 in Durham. In seventy-six of the largest towns the mean rate of infant mortality was 146 per 1,000; in London the rate was 123, while it averaged 155 in the seventy-five other large towns, and ranged from 48 in Hornsey, 55 in Hastings, 83 in Bournemouth and in Leyton, 98 in King's Norton, and 93 in Northampton, 214 in Stockport, 214 in Burnley, 219 in Blackburn, 225 in Rotherham, 226 in Rochdale, and 236 in Preston.

The death-rate among persons aged 1 to 50 years was 7.1 per 1,000 of the population estimated to be living at the end of the period, and was 1.1 per 1,000 below the mean rate in the ten preceding fourth quarters. In the seventy-six large towns the death-rate at this age-group was equal to 7.6 per 1,000; in London the rate was 7.1, while among the seventy-five other large towns the rate ranged, from 4.9 in Handsworth (Staffs), 4.9 in Leyton and in King's Norton, 4.8 in Reading and in Norwich, 4.9 in Aston Manor, and 5.0 in Hastings, to 10.4 in Warrington, 10.5 in Huddersfield, 10.8 in Oldham, and 13.6 in Middlesbrough.

Among persons aged 60 years and upwards the death-rate last quarter was equal to 63.7 per 1,000 of the estimated population at this age-group, being 4.3 per 1,000 below the average rate in the corresponding quarters of the ten preceding years. Among the several large towns the death-rate at this age-group was 67.4 per 1,000; in London it was 64.8 per 1,000, and it ranged from 44.6 in King's Norton, 46.2 in Hastings, 49.1 in East Ham, and 50.2 in Great Yarmouth, to 82.8 in Blackburn, 83.9 in Preston, 83.9 in Halifax, 85.5 in Newcastle-upon-Tyne, and 93.4 in Bootle.

The mean temperature of the air last quarter was considerably above the average, the excess ranging in most districts between 2.5° and 3.0°. The mean temperature during the quarter was 46.1° in all the districts, especially in the north-east, where the amount was only 5.3 per cent. of the average. The duration of bright sunshine exceeded the average over the country generally.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 8,921 births and 5,709 deaths were registered during the week ending Saturday last, February 20th. The annual rate of mortality in these towns, which had been 18.0, 18.7, and 17.5 per 1,000 in the three preceding weeks, rose again to 18.1 per 1,000 last week. The rates in the several towns ranged from 8.4 in Walthamstow, 9.3 in Leyton, 9.4 in Bournemouth, 10.7 in Devonport, 11.0 in Wallasey, 11.2 in East Ham, 11.3 in Totter-

ham, to 23.2 in Manchester, 23.3 in Merthyr Tydfil, 24.5 in Warrington, 24.8 in Liverpool, 25.2 in St. Helens, 25.5 in Hurry, and 31.1 in Wigan. In London the rate of mortality was 18.7 per 1,000, while it averaged 17.9 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.6 per 1,000, in the seventy-six towns; in London the death-rate from these diseases was 1.7 per 1,000, while it ranged upwards in the other towns to 3.1 in Sheffield, 3.2 in Rotherham, 3.5 in Willemsden, 3.5 in Middlesbrough, 3.6 in Sunderland, 3.8 in Birmingham, 5.5 in Aston Manor, and 5.9 in West Hartlepool, and 6.5 in Warrington; enteric fever of 1.5 in Hull, 1.6 in St. Helens, 1.7 in Reading and 1.6 in Leyton and in Derby; whooping-cough of 1.3 in Norwich, 1.9 in Tynemouth, and 2.3 in Wigan; enteric fever of 1.4 in Grimsby; and diarrhoea of 1.5 in Middlesbrough. No fatal case of small-pox was registered last week in any of the seventy-six large towns. The number of scarlet fever cases remaining under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital at the end of last week was 2,910, against 3,201, 3,117, and 3,002 at the end of the three preceding weeks; 273 new cases were admitted during the week, against 339, 312, and 289 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

DURING the week ending Saturday last, February 20th, 974 births and 705 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 17.2, 18.5, and 19.2 per 1,000 in the three preceding weeks, rose again to 18.9 per 1,000 last week, and was 1.7 per 1,000 above the mean rate during the same period in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 14.6 in Leith and 17.8 in Edinburgh to 22.8 in Dundee and 23.5 in Perth. The death-rate from the principal infectious diseases averaged 2.3 per 1,000, the highest being recorded in Aberdeen and Paisley. The 333 deaths registered in Glasgow included 4 which were referred to scarlet fever, 9 to diphtheria, 22 to whooping-cough, 5 to enteric fever, 2 to cerebro-spinal meningitis, and 6 to diarrhoea. Seven fatal cases of whooping-cough and 2 of diarrhoea were recorded in Edinburgh; 4 of whooping-cough and 3 of diarrhoea in Dundee; 3 of measles, 2 of diphtheria, 4 of whooping-cough, and 2 of diarrhoea in Aberdeen; and 4 of whooping-cough and 2 of diarrhoea in Paisley.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, February 20th, 552 births and 470 deaths were registered in the twenty-two principal urban districts of Ireland as against 632 births and 447 deaths in the preceding period. The annual death-rate in these districts, which had been 22.5, 20.7, and 20.4 per 1,000 in the three preceding weeks, rose to 21.5 per 1,000 in the week under notice, this figure being 3.4 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 25.8 and 17.1 respectively, and in the other districts ranging from 5.2 in Limerick and 8.2 in Drogheda, to 38.8 in Galway and 40.9 in Waterford, while Cork stood at 21.2, Londonderry at 8.5, and Limerick at 16.4. The zymotic death-rate in the twenty-two districts averaged 1.1 per 1,000, as against 1.0 per 1,000 in the preceding period.

Hospitals and Asylums.

WEST HAM LUNATIC ASYLUM.

THE annual report for the year 1907 of Dr. David Hunter, the medical superintendent of the West Ham County Borough Lunatic Asylum, shows that on January 1st, 1907, there were 850 patients on the asylum registers. There were also 120 patients boarded-out in other asylums, making a total number of 970 patients belonging to the borough on that date. On the last day of the year there were 864 in the asylum, making, with the 120 boarded-out cases, 984 in all, and giving an increase for the year of 14, as compared with 51 for the previous year. Dr. Hunter has drawn up two tables showing the proportion of West Ham pauper insane to 10,000 of population for each year since 1901, and the proportion per 10,000 of admissions since 1899, and of first admissions since 1902. From the first table we see that, although the proportions to population of West Ham's pauper insane have kept steadily below that of England and Wales, West Ham's rate of increase has been considerably greater than that of England and Wales. West Ham's rate having increased from 25.5 in 1901 to 30.4 per 10,000, or an increase of ratios of 11.4 per cent., whereas that for England and Wales increased from 30.27 to 32.37 per 10,000, an increase of ratios of 10.6 per cent. On the other hand, the West Ham admission-rate has declined from 11.04 in 1901 and 12.85 in 1902 to 8.51 per 10,000 in 1907, and the first-admission rate from 11.76 per 10,000 in 1902 to 5.18 in 1907. Thus, though the rate of occurring insanity is apparently increasing, as a general distribution, the population is progressing at a rate indicating the necessity for considerable extension of an already much overcrowded asylum. The total cases under treatment during the year numbered 1,118, and the average number daily resident 839. During the year 268 cases were admitted, of whom 254 were direct admissions and 14 transfers. These figures show a fall in the direct admissions of 38, as compared with those of the previous year. Of the 254 direct admissions, 70 the attacks were first attacks within three, and in 19 more within twelve, months of admission; in 60 not-first attacks within twelve months of admission, and in the remainder, whether first attacks or not, the attacks were either of more than twelve months' duration (74) or congenital cases (27), or of unknown duration (4). The direct admissions were classified according to the forms of mental disorder into: Mania of all kinds, 58; melancholia of all kinds, 62; senile and secondarily dementia, 24; general paralysis, 24; epileptic insanity, 15; delusional insanity, 6; primary dementia, 6; stupor, 4; confusional insanity, 5;

acute delirium, 1; and congenital or infantile defect, 27. As to the probable etiological factors in these cases, alcohol was assigned in 45, or 17.7 per cent., syphilis in 4, critical periods in 63 (old age in 42), diseases of the nervous system in 40 (epilepsy in 29), trauma in 15, and mental stress in 43. A heredity of insanity was ascertained in 93, or 36.6 per cent., an epileptic heredity in 14, and an alcoholic heredity in 55, or over 15 per cent. Including 2 more with a neurotic heredity and a family history of suicide, the above figures give a total neuropathic heredity in over 56 per cent. of the direct admissions. During the year 88 were discharged as recovered, giving recovery-rates of (a) total recoveries on the direct admissions of 34.11 per cent., and (b) of recoveries in the direct admissions on the direct admissions of 33.33 per cent. There were also 31 discharged as relieved, and 22 as not improved. Also during the year 113 died, giving a death-rate on the average numbers daily resident of 13.46 per cent. The deaths were due in 40 to cerebro-spinal diseases, including 25 from general paralysis; in only 4 to diseases of heart and blood vessels; in 9 to abdominal diseases; in 23 to senile decay; in 2 to accident, and in 35 to general diseases, including 17, or 15 per cent., to tuberculous diseases. The general health was good throughout the year, and with the exception of 1 case of dysentery the asylum was free from infectious disease.

BRADFORD ST. CATHERINE'S HOME FOR CANCER.

THE annual meeting of this excellent charity was held on December 16th, 1908, the Lord Mayor of Bradford presiding. The sixteenth annual report, which, as usual, was a model of what a report should be, recorded the great loss sustained by the death during the year of Mr. Joseph Cawthra, the donor of the present home, who by his will had bequeathed £3,000 to the hospital. Of the 50 patients treated in the home during the year, 36 were from Bradford, and the remainder from adjacent towns. Forty of the cases were cancer. The increase in requests for the admission of cancer cases had compelled the committee to refuse admission to many urgent and deserving chronic incurable cases. As a consequence of this, the committee suggested the addition of a wing to the present building for the reception of chronic incurable cases, and it is hoped that some other generous benefactor may be found to follow Mr. Cawthra's example and aid the project. We heartily endorse the committee's suggestion, as more room for cases of this class is urgently required.

FORSTER GREEN HOSPITAL, BELFAST.

THE thirteenth annual meeting of this institution was held in Belfast on January 29th. Mr. Herbert Ewart presided. Considerable interest was manifested, as this was the first meeting since the city has endowed a number of beds. Dr. Houston, honorary secretary of the medical staff, read the medical report; 425 new cases attended the out-patient department, and 137 had been admitted to the wards at Knockbreda during the year. There was accommodation for 73 patients, and although the new wards had only been opened since October the beds were full. Dr. Robert May had been appointed resident physician to the hospital, and Dr. Foster Coats physician for cases in the town attending the dispensary. The present out-patient accommodation is too cramped, and a Roentgen-ray department is needed.

THE ROYAL MIDLAND COUNTIES HOME FOR

INCURABLES.

DURING the past year, a valuable addition has been made to the property of the Royal Midland Counties Home for Incurables at Leamington by the acquisition of Tachbrook House and grounds. The property was bought mainly with the object of obtaining a site for a new chapel, but the house gives useful accommodation for some of the staff of the institution, and thus makes it possible to receive additional patients. The cost of the new chapel is about £4,000, of which only £2,065 has, so far, been contributed. The annual report shows that the home of the home has been the largest event of the year, and it has been fortunate in the matter of legacies and donations. The committee has instituted during the past year two new free beds and two new pensions, in addition to the two free beds and two pensions which were created under the Wand bequest.

THE COVENTRY AND WARWICKSHIRE HOSPITAL.

THE annual meeting of the Coventry and Warwickshire Hospital was held on December 18th, 1908, at St. Mary's Hall, Coventry, the Mayor (Alderman Lee) presiding. The annual report showed that there had been a decrease of 1,794 cases in the out-patient department, and an increase of 62 in the number of in-patients during the year, as compared with the previous year. The ordinary income was £5,589, against £5,844 in 1907. On account of the overcrowded condition of the wards, a scheme for extending the accommodation of the hospital was recommended.

DEWSBURY INFIRMARY.

AT the annual meeting of this infirmary a point of some interest to the medical staffs of hospitals arose. It was moved that "no future elected honorary medical officer may continue to hold such position beyond 60 years of age, but on resigning is eligible for appointment as consulting surgeon, in accordance with Rule 24." The resolution, however, was supported by very few votes, and was consequently lost.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column, advertisements must be received not later than the first post on Wednesday morning.

VACANCIES.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

THE British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the BRITISH MEDICAL JOURNAL is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the BRITISH MEDICAL JOURNAL for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

OF

EXECUTIVE COMMITTEE.

Clinical Instruction in Infectious Diseases.

The existing regulation proposed to be modified is as follows:

The letter stated that the proposal of the Metropolitan Asylums Board was to substitute for the compulsory attendance on two days of each week attendance at times which will suit the student's convenience, but which will require him to be present on not less than sixteen occasions in a two months' course, and not less than twenty-four occasions in a three months' course. The Local Government Board, considering that any alteration of the regulations must have in view the requirements of the various examining bodies, had inquired as to the nature of these requirements, but did not find that they were either uniform or very precisely expressed. The Board, therefore, asked for the views of the General Medical Council as to whether the medical superintendent who signed the student's certificate might or might not be left unfettered by any such restriction as the Metropolitan Asylums Board proposed. In conclusion the Local Government Board asked the Council whether, if the requirements of the

Provided that no such certificate shall be granted in any case in which a student has attended for instruction during the entire course of study for a number of hours, which is less than a total number calculated after the rate of hours in respect of each month of the said course of study.

That in the opinion of the Executive Committee the responsibility for granting certificates of attendance should be left to the medical superintendent, the only regulation necessary being to the effect that the superintendent should be satisfied that the student has bona fide attended with diligence and regularity the clinical instruction given at the asylum during the period prescribed by the licensing body concerned. The Committee do not think it is necessary to require absolute uniformity in regard to the regulations of the licensing bodies. They see no disadvantage in deleting the proviso from Regulation 7.

The Committee assume that no change is suggested in the conditions of attendance required of candidates for the Diploma in Public Health who are studying methods of administration at the asylums of the Board.

An Act for the Prevention of Quackery in New Zealand, forwarded by the Secretary of State for the Colonies, was considered, and the Committee adopted the following resolution

That the Committee have learned with satisfaction of the enactment in New Zealand of a stringent law against an obnoxious form of unqualified practice, and they would welcome similar legislation applicable to other parts of the Empire.

Title.—AN ACT to prevent the Practice of Quackery.
[October 10th, 1908.]

BE IT ENACTED by the General Assembly of New Zealand in Parliament assembled, and by the authority of the same, as follows:

1. *Short Title.*—This Act may be cited as the Quackery Prevention Act, 1908.

2. *Publication of False Statements in Order to Promote the Sale of Medicine, Preparation, etc., an Offence.*—Every person commits an offence who publishes or causes to be published any statement which is intended by the defendant or any other person to promote the sale of any article as a medicine, preparation, or appliance for the prevention, alleviation, or cure of any human ailment or physical defect, and which is false in any material particular relating to the ingredients, composition, structure, nature, or operation of that article, or to the effects which have followed or may follow the use thereof.

3. *Method of Publication.*—A statement shall be deemed to be published within the meaning of this Act if it is inserted in any newspaper printed and published in New Zealand, or is publicly exhibited in view of persons in any road, street, or other public place, or is contained in any document which is gratuitously sent to any person through the Post Office or otherwise, or which is gratuitously delivered to any person or left upon premises in the occupation of any person.

4. *Fines.*—Every person who commits an offence against this Act is liable, on summary conviction before a magistrate, to a fine not exceeding one hundred pounds in the case of a first conviction for any such offence, and not exceeding two hundred pounds in the case of a second or any subsequent conviction.

5. *Printer, Publisher, and Proprietor of Newspaper severally Liable for Offence.*—If any person causes any statement to be inserted in breach of this Act in a newspaper printed and published in New Zealand, the printer, publisher, and proprietor of that newspaper shall severally (and without excluding the liability of any other person) be deemed to have published that statement in breach of this Act, and shall be liable for an offence against this Act accordingly.

6. *Chief Health Officer to give Warning as to Publication of any Particular False Statement.*—(1) Notwithstanding anything in this Act, no prosecution shall be instituted against the printer, publisher, or proprietor of any newspaper registered under the Printers and Newspapers Registration Act, 1903, for the publication of any statement in breach of this Act unless before the publication thereof a warning has been delivered to the defendant under the hand of the Chief Health Officer under the Public Health Act, 1903, that such statement or some other statement substantially to the same effect is false, and that the publication thereof is an offence against this Act.

Mode of Delivery of Warnings.—(2) Without excluding other modes of delivery, any such warning shall be deemed to be duly delivered to the proprietor, publisher, or printer of a newspaper if it is delivered at the premises on which the newspaper is printed or published, or is sent through the post by registered letter to those premises, and is in each case addressed either by name or description to the proprietor, publisher, or printer, as the case may be, of the said newspaper.

7. *Informations to be laid by Chief Health Officer.*—Every information for an offence against this Act shall be laid by the Chief Health Officer under the Public Health Act, 1903, or by some person authorized by him in that behalf either generally or in the particular case.

8. *Attorney-General to Consent to Prosecutions.*—No prosecution shall be commenced against any person for an offence against this Act without the leave of the Attorney-General.

9. *Appeal.*—Every person convicted of an offence against this Act shall have a right of appeal under the Justices of the Peace Act, 1903, on any question of law or fact, whatever may be the amount of the fine which has been imposed upon him.

10. *Interpretation.*—In this Act, unless a contrary intention appears—

"Document" includes any article of whatever nature which has any words or statement printed or impressed upon it or otherwise attached thereto, or appearing thereon;

"Newspaper" means any newspaper registered under the Printers and Newspapers Registration Act, 1903, or any periodical publication which is published at intervals not exceeding three months; and for the purposes of this Act every document which at any time accompanies and is distributed along with any newspaper shall be deemed to form part of the newspaper;

"Public place" has the same meaning as in section twenty-eight of the Police Offences Act, 1903.

1. *Commencement.*—This Act shall come into operation on the first day of January, nineteen hundred and nine.

Medical Registration in Ceylon.

The Committee considered an Ordinance transmitted by the Secretary of State for the Colonies to amend the Ceylon Medical Registration Ordinance, 1905. In November, 1905, the Executive Committee had expressed its warm approval of the provision of the Ceylon Ordinance of that year, making it a punishable offence for an unregistered and unqualified person (other than a native practising native methods) to practise for gain, to profess to practise, or to publish his name as practising medicine or surgery.

The new Ordinance contained the following clause:

21. Notwithstanding anything in this Ordinance, it shall not be unlawful for the following persons to practise medicine and surgery for gain:

(a) Any Government apothecary actually employed in the public service as an apothecary.

(b) Any estate dispenser appointed by a superintendent to an estate or group of estates with the approval of the principal civil medical officer, but only during the time he is actually so employed.

The Executive Committee, having considered the matter, adopted the following resolution:

That the Committee observe with regret that the valuable provisions of the Ceylon Ordinance No. 2 of 1905 have in some particulars been relaxed. They trust that the local exigencies which appear to have led to the relaxation may be of a temporary nature, and that Ceylon may soon be in a position again to require that those who undertake to practise any branch of medicine should be fully qualified for that responsible duty.

Tasmanian Medical Act, 1908.

The Committee also considered the Medical Act, 1908, of Tasmania, transmitted by the Secretary of State for the Colonies:

The Act repeals previous Acts, and consists of two parts. Part I provides for the appointment by the Governor of a medical council of Tasmania, to consist of nine members, all of whom must be members of the medical profession. The Council is to keep a register of medical practitioners legally qualified within the meaning of the Act. The Council has power to require any person or witness before it to make a solemn declaration. Any person who makes a false statement or attempts to utter any false, forged, or counterfeit diploma or other document shall be guilty of a misdemeanour, and on conviction shall be liable to be imprisoned for any period not exceeding three years. If a registered medical practitioner shall be convicted of felony or misdemeanour, or be judged by the Council to have been guilty of infamous conduct in any professional respect, the Council may refuse to issue a certificate, or where the certificate has been issued, direct the name to be erased from the Register, subject to an appeal to the Supreme Court. Power is also given to the Council to remove the name of a registered person who does not respond to a letter asking whether he has ceased to practise or changed his residence.

Part II entitles persons possessed of one or more of a list of qualifications set out in a schedule, and who shall prove on personal attendance to the satisfaction of the Council that such qualification was obtained after due examination from some university, college, or other body recognised for such purpose in the country to which such body belongs, shall be entitled to registration and shall receive from the Council a certificate of qualification. There is a clause saving the rights of persons now practising in any State of the Commonwealth. The sections regulating the right to practise are as follows:

15. *Persons Unregistered Using Medical Titles to be Subject to Fine.*—It shall not be lawful for any person, unless registered under this Act, to pretend to be, or to take or use the name or title of a physician, doctor of medicine, licentiate in medicine and surgery, master in surgery, bachelor of medicine, doctor, surgeon, medical or general practitioner, or any other medical or surgical name or title; and every unregistered person so offending shall forfeit and pay a sum not exceeding Fifty Pounds, to be recovered in a summary manner: Provided that any person who shall feel himself aggrieved by any such conviction or order of justices may appeal therefrom, in accordance with "The Appeals Regulation Act."

16. *Medical Practitioners holding Certificates to be Entitled to Sue for Fees, etc.*—Every medical practitioner who at the commencement of this Act is gazetted as a legally qualified medical practitioner, or who shall have received such certificate of qualification as aforesaid, shall afterwards be entitled to sue in any court of law within this State, to the extent of the jurisdiction of such court, for the recovery of his fees or other remuneration for his professional services, whether medical or surgical; and it shall be sufficient to state in the particulars of demand the words "for medical services," which shall include every demand for medical or surgical aid, including medicines, when supplied by the plaintiff to the defendant; and no person shall be entitled to recover any charge in any court of law for any medical or surgical advice or attendance, or for the performance of any operation, or for any medicine which he shall have both prescribed and supplied, unless he shall prove on the trial that he is registered in accordance with the provisions of this Act.

The Council is entitled to demand the following fees: For registration, £3 3s.; for registering an additional qualification, 10s. 6d.; for restoring a name to the Register £1 1s.

The schedule of qualifications enumerates various British diplomas, and also gives the right of registration in Tasmania to any person registered on the *Medical Register* of the United Kingdom.

The Executive Committee after consideration adopted a resolution to the following effect:

That the Committee, while of opinion that the Tasmanian Act will tend to the better control of professional practice, regret that the opportunity has not been taken to restrict the practice of medicine to duly qualified practitioners.

The Apothecaries' Hall, Dublin.

A communication having been received from the Apothecaries' Hall, Ireland, stating that it had determined to postpone the resumption of its preliminary examination in education until July 1st of this year, the Committee adopted the following resolution:

That the Committee have received with regret the intimation of the Board that it still proposes to hold a Preliminary Examination, though the date is now postponed to July 1st, 1909. The Committee remind the Board of the Council's Resolution of November 28th, 1908, which was in general terms, and had no reference to any particular date. They propose to report the Secretary's letter of January 16th, 1909, to the General Council at the May Session.

Constitution of Committee.

The Committee received with regret a notification from Dr. Pye-Smith of the resignation of his seat on the Medical Council, and co-opted the Chairman of the Business Committee, Dr. Norman Moore, to fill the vacancy thus created.

Anaesthetics.

The President informed the Committee that inquiries had been addressed to the licensing bodies with a view to ascertaining how far effect had been given to the Council's Recommendation as to practical instruction in the administration of anaesthetics, and read answers from most of them showing that steps had been or were being taken to give effect to the Recommendation. The President undertook to inform the Privy Council of the progress made in regard to this question.

be glad to receive further donations without delay, as it is proposed shortly to close the fund; subscriptions may be earmarked for Mrs. Hird.

British Medical Association.

CENTRAL EMERGENCY FUND.

BIRMINGHAM BRANCH FUND FOR COVENTRY DISPUTE.

A FUND is being raised by the Birmingham Branch, with the approval of the Medico-Political Committee of the Association, for the purpose of giving some token of approval and sympathy to the medical men who resigned their posts on the Coventry Provident Dispensary, and for the purpose of assisting Mrs. Hird.

To those who have not followed or who have forgotten the circumstances of this case, it may be of assistance to be reminded that the dispute originated in a desire of the staff of the dispensary for an improvement of the conditions of their appointment. The staff appealed to the Division for support, and the Division formulated the conditions which should, in their opinion, apply to provident dispensary work within the borough, these conditions being practically identical with those formulated by the Medico-Political Committee and approved by the Representative Meeting of the Association. The staff negotiated with the dispensary committee for such alterations of the regulations of the dispensary as would be necessary to bring it into line with the views of the Division. The dispensary refusing to accede to these representations, the members of the staff found it necessary, in loyalty to the Association, to resign their appointments, a step which has entailed upon them considerable pecuniary loss. This loss has been felt most severely by the widow of the late Dr. Hird, a member of the staff, who died a few months after the termination of his appointment at the dispensary.

Intending subscribers desiring fuller information are requested to apply to Dr. J. Otton, Honorary Secretary of the Coventry Division, Great Heath House, Coventry; or to the Medical Secretary, 429, Strand, W.C.; or to Dr. Thomas Wilson, 87, Cornwall Street, Newhall Street, Birmingham, Honorary Treasurer of the Branch. Dr. Wilson acknowledges the following subscriptions, and will

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BATH AND BRISTOL BRANCH.

THE fourth ordinary meeting of the session was held at Bath on February 24th, Mr. J. PAUL BUSH, C.M.G., President, in the chair. There were fifty-five members and visitors present.

Discussion.—A discussion on dysmenorrhoea was opened by Dr. G. HERMAN, and was maintained by Dr. W. C. SWAYNE, Colonel LIFE, I.M.S., Dr. ALEXANDER, Dr. KENNEDY, Dr. H. TAYLOR, Dr. MUNRO, Dr. WILMORE, Dr. BEATH, Dr. DUNN, Dr. NEILD, Dr. HEATCOTE, Mr. FRASER, Dr. LOCKET, and Dr. POOLEY.

Vote of Thanks.—A vote of thanks to Dr. Herman was proposed by the President, seconded by Dr. CAVE, and carried by acclamation.

EDINBURGH BRANCH:

NORTH-EAST EDINBURGH DIVISION.

A MEETING of this Division was held on Wednesday, February 17th, at 8.30 p.m., at 5, St. Andrew Square. Dr. LESLIE MACKENZIE, Chairman of the Division, presided. There were also present: Drs. G. Fyfe, McLarty, James Cameron, R. Robertson, Martyn Clark, James Smith, and the Secretary.

Confirmation of Minutes.—The minutes of the meeting held on July 9th, 1908, were read, approved, and signed.

Annual Report.—The SECRETARY gave the Division annual report, and the accounts for 1908 were duly audited by Drs. McLarty and James Cameron, and found correct.

Earlier Appointment of Representatives.—A letter from the Organization Committee with regard to the earlier appointment of Representatives was considered; it was arranged to obtain powers at the annual meeting to make the proposed change.

Report of the Representative Meeting.—Dr. R. ROBERTSON gave his report of the Representative Meeting, and was cordially thanked by those present.

(As the Chairman had to leave, Dr. JAMES CAMERON now took the chair.)

The Association and the General Practitioner.—A remit from the Branch Council was next considered; it was a resolution of the Southern Division to the following effect:

That the British Medical Association, through its Divisions, does not meet the local requirements of the general medical practitioner.

After discussion, the following motion, proposed by Dr. R. ROBERTSON, and seconded by Dr. JAMES SMITH, was declared carried by the CHAIRMAN:

That no modifications are required in the British Medical Association to meet the local needs of the general practitioner in Edinburgh.

Whole-time Medical Officers of Health.—A remit from the Public Health Committee on the subject of whole-time medical officers of health was discussed. The meeting was of opinion:

That it is desirable in all places where a suitable salary can be obtained that a whole-time medical officer of health be appointed.

Notification of Births Act.—Some information about the powers of the city lady health visitor under the Notification of Births Act was given by the SECRETARY.

Medical Men and Street Casualties.—An exchange of views on the relation of medical men to street casualties, and the method of dealing with them, terminated the proceedings.

LANCASHIRE AND CHESHIRE BRANCH:

MANCHESTER (WEST) DIVISION.

A GENERAL meeting of the Division was held in the Technical Institute, Stretford Road, on Tuesday, February 9th, Dr. F. H. WORSWICK in the chair. The members present included Drs. Boyd, Cousins, Cullen, D'Ewart, Wallace Eales, E. W. Floyd, E. Jackson, Loudon, Mookler, W. H. Richardson, Prowse, Brown Ritchie, Stennett Redmond, Sir W. J. Sinclair, and J. H. Worswick. The following visitors responded to an invitation to attend the meeting which had been forwarded to members of other Manchester and Salford Divisions: Drs. W. G. Booth, Grant Davie, T. Arthur Helme, and J. H. Taylor.

Apologies for Non-attendance.—Apologies for non-attendance were received from Drs. W. Coates, Vipont Brown, and Scanlon.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Correspondence.—The HONORARY SECRETARY read a letter from the Medical Secretary acknowledging the receipt of report and resolutions from the Division in connexion with the communications from the Hospitals, Medico-Political, and Organization Committees on subjects which were dealt with at the January meeting of the Division; also a letter from the Honorary Secretary of the Sheffield Division in regard to Contract Practice.

Midwives Act.—The meeting proceeded to discuss some matters connected with the Midwives Act, and more particularly the questions referred to the Departmental Committee which is now holding an inquiry into the working of that Act. A letter from Mr. Smith Whitaker, stating the attitude recently taken up by the Central Council of the Association, was read. Dr. STENNETT REDMOND opened the discussion, and proposed:

That this general meeting of members of the Manchester (West) Division strongly urges the advisability of providing for the adequate and immediate representation of the general practitioners of this country on the Departmental Committee appointed to inquire into the working of the Midwives Act; and suggests that two general practitioners, to be nominated by the British Medical Association, shall be empowered to serve on that Committee.

The resolution was seconded by Dr. LOUDON and agreed to by the meeting, 11 members voting in favour of and 2 against it. The following resolutions were unanimously adopted:

That this meeting instructs its Honorary Secretaries to write to the Joint Committee of the Manchester and Salford Divisions, and to urge that body to take immediate

measures to ensure that ample evidence of the working of the Midwives Act in Manchester and Salford shall be laid before the Departmental Committee.

That this meeting is of opinion that adequate payment should be guaranteed by the local authorities to medical practitioners, for services rendered by them when summoned by midwives to attend poor women before, during, and after labour.

The Honorary Secretaries were instructed to forward all the above resolutions to the secretary of the Departmental Committee, to the Medico-Political Committee of the Association, and to the Joint Committee of the Manchester and Salford Divisions.

Medical Inspection and Treatment of School Children.

—The report on the medical inspection and treatment of school children, drawn up by the Executive Committee in accordance with the instruction of the general meeting of January 19th, was read; and, after discussion, in the course of which Dr. A. Brown Ritchie gave some account of the measures taken by the school authorities of Manchester, was adopted. The report deals chiefly with conditions in large towns, and sets forth the following opinions of the Division:—(1) With regard to the medical inspection of school children. Medical officers of health and assistant medical officers of health should not be employed as medical inspectors of school children. Medical inspectors and assistant medical inspectors of school children should be whole-time officers with salaries, in the one case, of not less than £500 per annum; and, in the other case, of not less than £250 per annum. (2) With regard to medical treatment of school children: Notice of defects or diseases discovered on medical inspection should be forwarded by post to the parents. For this purpose two separate forms should be used: (a) for cases in which the services of a doctor are required; and (b) for cases in which other measures to be taken by the parents are recommended. Those parents who are in a position to afford the expense should be required to pay for necessary treatment. The children of those parents who cannot afford payment should be referred for treatment under the Poor Law system. Parents who, after due notification, fail to carry out the measures recommended should be proceeded against for neglect. Cases of mental deficiency and defects of speech should be sent to special schools. Any attempt on the part of the public authorities to arrange for the treatment of school children at hospitals and other charitable institutions is unsound in principle, and should be condemned. The establishment of school clinics is totally uncalled for. If such clinics are established, their scope of treatment should be limited to (i) errors of refraction, and (ii) venous conditions; and that, in this case, treatment should be carried out by whole-time medical officers (medical inspectors). If treatment in school clinics is extended to other diseases and defects, the duties should be performed by part-time medical officers; and such appointments should be open to any practitioners in the district who are prepared to give time to the work. The remuneration of these part-time medical officers should be by time, and at the rate of one guinea for each morning's work (two or three hours). Such remuneration should be provided by the Board of Education, and not by the local authorities.

Annual Report to Branch Council.—The annual report of the Division to the Branch Council was read and adopted.

SOUTHPORT DIVISION.

A SPECIAL meeting of the Division was held at the Temperance Institute on February 23rd to consider matters referred to Divisions. Dr. GILL was in the chair. There were also present Drs. Baidon, Lewis, Walker, and Harris.

Apologies for Non-attendance.—Apologies were sent by Drs. Anderson and Ashworth.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Medical Inspection of School Children.—The report of the Medico-Political Committee on certain points arising in connexion with the medical inspection of school children and treatment of those found defective was considered, and the questions were unanimously answered as follows:

Inspection.—(1) Does the Division approve of the system of payment per head?—No, but by fixed salary with payment of expenses.

Treatment.—(1) This Division reiterates its previously expressed opinion that parents having the means should pay private practitioners for treatment, and that hospitals should only be resorted to in exceptional cases, but that

(2) If a school clinic should be established payment should be per case, and all registered medical practitioners in the areas of the respective authorities desiring to share in the work should be appointed on the staff of the school clinic, the work to be done in their own surgeries and the selection of the practitioners in each case to be left to the parents.

(3) This opinion would apply to both the borough and county areas contained in this Division.

(4) That parents having received notice of defect from the school medical officer, the child should be excluded from school until a medical certificate is supplied that the defect has been satisfactorily dealt with and that the child is fit to attend school. In case of non-compliance with the notice to have the defect treated, the parents should be prosecuted for the child's non-attendance at school.

Whole-time Medical Officers of Health.—The Public Health Committee's report on the desirability of health officers being required to give their whole time to the work was considered and it was resolved unanimously:

That medical officers of health should be debarred from engaging in private practice, and that even in thinly populated rural districts the reasons in favour of the appointment of a whole-time officer with a large area under his administration preponderates over those for local part-time appointments.

Draft Charter.—The Organization Committee's report on legal questions as to opposition by Branches to certain clauses of the draft Charter was communicated to the meeting.

Earlier Appointment of Representatives.—The Medical Secretary's letter respecting earlier appointment of Representatives was read, and it was unanimously resolved:

That Dr. Stanley A. Gill be nominated our Representative and Dr. Harris his deputy at the Representative Meeting at Belfast with the view to election at the next meeting of the Division, and that to this end notice be given on the next notice of meeting of alteration of our Rules so as to permit of the election of the Representative at any time not more than nine months nor less three weeks before the Annual Representative Meeting.

LEINSTER BRANCH.

Irish Committee.

At the annual meeting of this Branch held on Saturday, February 13th, a report of which was published in the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of February 27th, p. 108, Dr. CRAIG (in the absence of Dr. Joseph Kenny, Granard, who was unable to attend) laid before the members of the Branch an account of the working of the Irish Committee of the Association during the past twelve months. On this committee there were representatives from Ulster, Leinster, South-Eastern, Munster, and Connaught Branches, so that when the fifteen members met they were able to lay the views of the Branches of the different parts of the country fairly well before one another, and the result had been that they had been able to work on fairly even lines instead of wrestling against each other. In January they passed a resolution, the effect of which was to ask the Local Government Board whether any steps were being taken to obtain powers to make a compulsory scale of salaries where Poor Law unions had failed or refused to adopt a scale, and the answer they received was in the negative. In April they passed another resolution that, as about fifty unions had fixed a scale on a more or less satisfactory basis, the time had come for the Local Government Board for Ireland to fix a scale which must be adopted by those unions which had up to the present failed to fix a scale. In spite of that, and in spite of repeated letters sent to the Board, they had absolutely refused to do anything to come to the assistance of those men in the poorer districts whose salaries were still on a low scale, whereas in the better paid districts the medical officers had had their salaries raised. In April of last year the attention of the Association was called to the Tuberculosis Bill with a view to seeing that its provisions should place no undue restrictions on medical men. A point they had been able to do something in connexion with was that of instruments and medicines. The list supplied by the Local Government Board was reported to be quite inefficient and ineffective, but they

were met in a fair spirit by the Board, who accepted the recommendations that were made by the Irish Committee. Another point before them was the question of the inspection of school children. There was a proposal that the Act for the inspection of school children should be extended to Ireland, but it was discovered that the expenses of the Act in England had been so very much greater than was anticipated, that they were forced to hold their hands for the moment, and not work for its extension into Ireland, purely for financial reasons. The CHAIRMAN thanked Dr. Craig for the account which he had laid before the meeting of the work of the Irish Committee for last year. If things were not altogether so satisfactory as they might wish in the matter of the remuneration of medical men in the Poor Law service, at least the thin end of the wedge had been got in, because fifty of the unions had awakened to their duties, in a more or less satisfactory manner, in the matter of a suitable scale of salaries. Dr. FALKNER suggested that those who were responsible for the national schools should do something to have the schools inspected by doctors. He was a manager of a national school, and was anxious to know what steps he should take to have inspection made. This was a thing which should be brought home to those who were responsible for national schools. Children were put into badly-ventilated schools with other children suffering from tuberculosis, and while that was going on there could be no reduction of the tuberculosis death-rate.

METROPOLITAN COUNTIES BRANCH:

HAMPTSTEAD DIVISION.

A MEETING of this Division was held on Tuesday, February 23rd, at 8.30 p.m., at the Hampstead Conservatoire, Swiss Cottage, N.W., Dr. OFFENHEIMER in the chair.

Whole-time Medical Officers.—The report of the Public Health Committee on the desirability of health officers being required to give their whole time to the work was considered (see BRITISH MEDICAL JOURNAL SUPPLEMENT of January 23rd, 1909). It was resolved on the motion of Mr. ARMIT:

1. That the Hampstead Division agrees that medical officers of health should be debarred from private clinical practice.
2. That medical officers of health should be whole-time medical officers.
3. That in rural districts the areas supervised should be enlarged where necessary—that is, in order to secure principles (1) and (2).
4. That every medical officer of health should hold a diploma of Public Health.
5. That he should receive an adequate salary.
6. That he should have security of tenure of his office.

LAMBETH DIVISION.

A GENERAL meeting of the Division was held in the court-room, Guy's Hospital, on Thursday, February 18th, at 4 p.m. There were present nineteen members and two visitors. Dr. ATKINSON was in the chair.

Confirmation of Minutes.—The minutes of the preceding meeting were read and confirmed. Arising out of them the SECRETARY reported that the following letter had been written to F. W. Michael, Esq., M.B., B.Ch.Edin., of 243, Camberwell Road, S.E.:

Dear Sir,—I am instructed by the Lambeth Division of the British Medical Association to call your attention to the fact that the term "Guy's Surgical Home" is very misleading to those who do not know that that institute is in no way connected with Guy's Hospital. My Division feels sure that it is only necessary to draw your attention to this fact for it to be remedied. It would like, however, to hear from you as to what steps you will take to prevent the continuance of the misconception.

With kind regards, I am,

Yours faithfully,

(Signed) HERBERT FRENCH,
Honorary Secretary, Lambeth Division,
British Medical Association.

In reply to this the following letter had been received:

Dear Sir.—Thanks for yours of yesterday. I regret the misconception that has arisen re "Guy's Surgical Home," and the matter has been accordingly attended to.

With kind regards,

Yours faithfully,

(Signed) F. MICHAEL.

Dr. ATKINSON reported that the plate in question had been removed.

Medical Inspection of School Children.—A communication re the medical inspection of school children and the treatment of those found defective was considered, and on the motion of Dr. FRENCH, seconded by Dr. CAPES, the following replies to the questions therein asked were authorized:

1. (a) Yes.

(b) Not applicable to London.

(c) Yes; 5s.

(d) No.

2. No answer need be given to this question, owing to the decision of the London County Council that no special school clinics be established at present.

3. The Lambeth Division contains no rural area.

4. No suggestions.

Earlier Election of Representatives.—Dr. FRENCH moved, Dr. TAYLOR seconded, and it was carried unanimously:

That in future sessions, notwithstanding any regulation or by-law of the Division to the contrary, the Representative of the Lambeth Division for the meeting of Representatives be elected before Christmas, if possible in October.

The Cure of Ringworm.—Dr. IREDELL then read a paper upon the cure of ringworm, illustrated by a-ray apparatus, Sabouraud's pastilles, and so forth, and exhibited cases in process of cure. He explained that the a-ray treatment, properly carried out, was most effective in the cure of ringworm, though it could not be applied when the ringworm was associated with impetigo or kerion, which were made worse. After a single exposure of a given area of the scalp to produce Tint B of Sabouraud's pastilles nothing happens, unless a slight erythema about the seventh day, until the fourteenth day, when the hairs in the area treated begin to get loose. By the sixteenth day these hairs are so loose that they can be picked out, and they have all fallen out by the twenty-first day. In six weeks to two months downy hairs begin to appear over the area treated, and in four months' time the area is again covered with hair. To prevent infection of other parts of the scalp by seurf, scales, and hair from the part that has been depilated, it is usual to apply glycerine and carbolic acid in half strength to the part. He said that there had been no permanent baldness in any single one out of 700 consecutive cases. He thought that the cicatrices on the scalp and the thinness of the hair which had been reported must be very rare in cases properly treated. Other cases might become pus-infected or suffer from actual a-ray burn. Neither of these complications was likely to occur, however, if the position of the pastille and its colour received accurate attention. He drew attention to the fact that in Paris, where ringworm cases were treated in ringworm hospitals, the duration of the stay of each patient was reduced upon the average now from twenty-seven months to three; and the cost per patient was now only 270 francs, whereas it had formerly been 2,000 francs per head. An interesting discussion, in which Drs. DENNING, SOPER, TAYLOR, STODDART, and CAPES took part, was replied to by Dr. IREDELL.

Vote of Thanks.—The meeting adjourned at 5.30 p.m., after expressing a vote of thanks both to Dr. Iredell and to the Treasurer and Governors of Guy's Hospital, the former proposed by Dr. TAYLOR and seconded by Dr. EDELSTEIN, the latter proposed by Dr. DENNING and seconded by Dr. SOPER.

MIDLAND BRANCH:

LEICESTER AND RUTLAND DIVISION.

Medical Inspection of School Children.—A meeting of this Division was held specially to discuss questions relating to medical inspection of school children, at which twenty-two members were present. The following resolutions were passed:

A. That this Division considers that the work of school inspection should be carried out by whole-time medical officers appointed by the local education authority, subject to the approval of the Board of Education.

That we approve of the scale of salaries suggested in the memorandum of the Medico-Political Committee (15.361)—namely, £500 per annum for the senior medical officer, and £250 a year for the assistant medical officer exclusive of expenses.

Carried unanimously.

B. That this Division is strongly opposed to the establishment of school clinics.

Carried unanimously.

C. That it is opposed to subsidizing either hospitals or dispensaries from State or rate education funds.

Carried with one dissentient.

D. That it considers that with the co-operation of the staffs of the infirmary, Poor Law officers, and the dispensaries there is ample provision for those who are unable to pay the ordinary medical fees. That it recommends that on the child being reported defective the parents are to be notified to that effect. That in all cases in which the parents can pay they be referred to their doctor, or allowed to choose whom they like.

Carried unanimously.

E. That if the parents are unable to pay any fee they shall receive a voucher to that effect signed by the head teacher, on presentation of which the child shall be entitled to free treatment under the Poor Law, or if a small fee can be paid, on presentation of a voucher to that effect the child may be seen at a dispensary or at the surgeries of such medical men as may be willing to see cases at a fixed fee.

That this voucher, in case doubt may arise as to the bearer being a suitable person to receive it, shall be passed on to the Charity Organization Society for investigation.

Carried, 7 to 2.

SOUTH-EASTERN BRANCH:

CHICHESTER AND WORTHING DIVISION.

A MEETING of the Division was held at Chichester on February 18th; Dr. EUSTACE (Arundel) in the chair.

Medical Inspection of Children's Act.—The working of this Act in West Sussex was fully discussed, and the following resolutions were passed:

1. That this meeting strongly protests against school children being sent to public institutions by the medical inspector without first being referred to the family medical attendant.

2. That this meeting strongly protests against the gratuitous treatment in public institutions by honorary medical officers of school children, other than those of necessitous parents, found to be defective by the medical inspectors under the Act, and the meeting hopes that concerted action will be taken by the British Medical Association to deal with the matter.

The Notification of Births Act.—The meeting considered what steps should be taken in event of any authority in the Division contemplating the adoption of this Act. It was decided that the matter be left to the Medico-Political Committee to form a deputation to wait on such authority, and place the views of the profession before it. These views were embodied in the following resolutions passed by the meeting:

1. The Notification of Births Act imposes a serious violation of professional confidence on medical practitioners, and especially in those cases where from a public point of view it is most unnecessary, as in cases where a medical man is in charge of a lying-in woman, he is far more competent to advise as to the upbringing of the child than any ordinary visitor sent by a municipal authority.

2. That early interference during the lying-in period by official visiting with inquisitorial methods would be seriously detrimental to the health of the mother.

3. That all breaches of professional confidence are greatly opposed to the public good, whether imposed by Act of Parliament or otherwise.

Whole-time Medical Officers of Health.—The report of the Public Health Committee on the desirability of health officers giving their whole time to the work was considered by the meeting, and the following resolution was carried unanimously:

That medical officers of health should be debarred from engaging in private practice.

Division of the South-Eastern Branch.—The meeting passed a resolution supporting the Brighton Division with regard to dividing up the Branch.

SOUTH WALES AND MONMOUTHSHIRE BRANCH:

MONMOUTHSHIRE DIVISION.

A MEETING of this Division was held at the Pontypool and District Hospital, on February 26th, Dr. W. F. NELLS, Chairman, presided, and seventeen members and one visitor were present.

Confirmation of Minutes.—The minutes of the previous meeting were read and confirmed.

Apology for Non-attendance.—A letter from Dr. W. D. Steel, apologizing for his inability to attend, was read.

Report of Disputes.—News was received that substantial progress had been made recently.

Whole-time Medical Officers.—The circular from the Public Health Committee was considered, and the following resolution was unanimously carried:

That in the opinion of the Division whole-time medical officers should be appointed for large areas, such as counties and county boroughs, and the part-time officers who have so efficiently carried out their duties in the past should continue to hold office in small districts.

Departmental Committee on Midwives Act.—The circular from this Committee was considered, and the Honorary Secretaries were instructed to reply to it.

Discussion on Pleurisy.—A discussion on pleurisy was opened by Dr. R. W. HASLETT, and continued by Drs. MULLIGAN, GREER, T. M. THOMAS, HAMILTON, J. MCGINN, ELLIOTT, and the CHAIRMAN. Dr. HASLETT replied.

Clinical Cases.—The following were shown: (1) Dr. MULLIGAN showed a case of persistent hæmaturia; (2) Dr. HASLETT, a case of tuberculous peritonitis with thickened pleura.

Votes of Thanks.—The members were entertained to tea after the meeting, and a hearty vote of thanks was passed to the Governors of the Hospital for the use of the room, and to the Matron for providing tea.

STAFFORDSHIRE BRANCH: MID-STAFFORDSHIRE DIVISION.

A MEETING of this Division was held at the Burton Infirmary on February 25th.

Whole-time Medical Officers of Health.—The letter from the Public Health Committee of January 27th was discussed, and it was resolved:

That medical officers of health, when possible, should be whole-time officers.

Midwives Act.—The letter regarding the Departmental Committee on the Midwives Act of February 20th was considered, and it was decided to reply that the Burton guardians had not circularized the profession and midwives; they had made no offer to pay fees in suitable cases, nor has any other local authority. With regard to touting and advertising by midwives, it was stated that a local nursing institution advertised in the local press. The Honorary Secretary was instructed to send an advertisement to the Medical Secretary, but none has appeared since the meeting.

Inspection and Treatment of School Children.—The following are the replies to the letter on this subject:

Questions of Fact.

1. Medical officer of health in Burton with assistant. Dr. Reid and four assistants for County of Stafford.
2. Medical officer of health £75 and assistant £75 per annum. Rural district whole time with salaries.
3. Travelling expenses allowed. Administrative expenses borne by county and town.
4. No.
5. In Burton the nurse assists the inspector, and visits the homes in case of vermin, etc.
6. In county nothing has been done. In Burton arrangements are being made to treat ophthalmic cases at the Burton Infirmary. The Division has taken no action.

Questions to be Answered.

1. (a) No. (b) No. (c) No. (d) Salary.
- 2 and 3. The Division is opposed to the establishment of school clinics in this Division at present, feeling that the present means for treating cases should have a full trial.
4. The payment by parents who can afford it should be ensured by proper inquiry by the institutions treating the children.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

MIDLAND BRANCH: BOSTON AND SPALDING DIVISION.—An ordinary meeting of this Division will be held on Friday, March 12th, at 2.45 p.m., at the White Hart Hotel. Agenda: (1) Minutes. (2) Cases, specimens, etc. (3) Medical treatment

for school children. (4) "Hints" to Divisions. (5) Whole-time medical officers of health. (6) Any other business. Tea will be provided for those desiring it, as on former occasions. The Honorary Secretary will be greatly obliged if members will let him know by March 10th if they are able to bring cases, etc.—A. E. WILSON, Honorary Secretary, Boston.

SOUTH-EASTERN BRANCH: GUILDFORD AND WINCHESTER DIVISIONS.—A joint meeting of the Guildford and Winchester Divisions will be held at the Royal Surrey County Hospital, Guildford, on Wednesday, March 10th, at 3 p.m. Agenda: (1) Minutes. (2) Colonel Firth, F.R.C.S., R.A.M.C. (Alderhot). (3) Dr. A. M. Mitchell (Guildford) will open a short discussion on The Importance of Early Operation in Appendicitis. (4) Dr. Bodington (Winchester) will read notes of A Case of Sarcoma of the Spinal Column, with specimens (macroscopic and microscopical). (5) Dr. Kingsford (Woking) will read notes of A Case of Intestinal Obstruction due to an Impacted Gall Stone. (6) Mr. Eric Sheaf (Guildford) will read notes of Two Cases of Enlarged Thyroid Treated by Operation, and will exhibit specimens. (7) Dr. Gauvin, Medical Superintendent of Lord Mayor Treloar's Cripples' Home, Alton, will read a paper on The Mechanical Treatment of Spinal Curves. (8) The following cases and specimens will be shown: (a) Mr. E. J. Smyth: Buphthalmos; (b) Mr. H. J. Fardon (Dr. Brodribb): Pseudo-hypertrophic Paralysis in a Boy; (c) Dr. Briscoe (Alton): Specimens from 5 cases of morbus cordis in the insane. Other cases will be shown from the wards by members of the hospital staff if time permits. Tea will be provided about 4.30. The Honorary Secretaries will be glad to hear from members whether they intend being present at the meeting or not, also from any others willing to show cases or specimens.—H. J. GODWIN, 35, Southgate Street, Winchester; E. J. SMYTH, "Maythorne," Guildford, Honorary Secretaries.

SOUTH-EASTERN BRANCH: ISLE OF THANET DIVISION.—The next meeting of this Division will be held at the Royal Sea-bathing Hospital, Margate, on Friday, March 12th, at 4.15 p.m. Bertram Thornton, Esq., M.R.C.S., in the chair. Agenda: Sir Malcolm A. Morris, K.C.V.O., F.R.C.S., will give an address on the Use of Radium in the Treatment of Diseases of the Skin. Any other business. If any member has a case of skin disease of special interest at present under his care he is requested to be good enough to arrange for its attendance at the hospital for demonstration. All members of the Association are invited to attend these meetings and to introduce professional friends.—HUGH M. RAVEN, Honorary Divisional Secretary.

YORKSHIRE BRANCH.—The next meeting of the Branch will be held at the Royal Eye and Ear Hospital, Bradford, on Wednesday, March 10th, at 4.30 p.m. Members intending to read papers, show specimens or cases, or to propose new members, are requested to communicate at 6.30 with the Secretary. Members will dine together at once.—ADOLPH BRONNER, Honorary Secretary, Bradford.

CENTRAL MIDWIVES BOARD.

A MEETING of the Central Midwives Board was held at Caxton House, Westminster, on February 25th, with Dr. F. H. CHAMPNEYS in the chair.

New Member.

A letter was received from the Clerk of the Privy Council informing the Board that the Lord President had been pleased to appoint the Hon. Mrs. Charles Egerton, of Mountfield Court, Robertsbridge, Sussex, a member of the Board, in the place of Miss Jane Wilson, resigned.

Midwives Practising before Notification.

A letter was considered from the Chief Constable of Manchester reporting that a midwife had been convicted and fined 20s. and costs for practising before notifying the local supervising authority. The Board decided that no action be taken in the matter.

A letter was considered from the Town Clerk of Chester, reporting Louisa Maria Teaves for practising as a midwife without having notified the local supervising authority, and the Board decided that she should be cautioned.

Midwives Act Committee.

A letter was considered from the Clerk of the Council, stating that in the Lord President's opinion the practical objects of the Midwives Act Committee would not be served by the addition to its numbers of representatives of special interests. This was in answer to the Board's request that the advisability of adding a general practitioner and a midwife to the committee should be considered. Dr. E. PARKER YOUNG, in moving a resolution

regretting that the Lord President of the Privy Council had not seen his way to concede to the suggestion contained in the resolution of the Central Midwives Board, said that it ought to be recorded on the minutes that the Board remained of the same opinion. This was seconded by Mr. STANLEY B. ATKINSON, and carried *nem. con.*

Registration of Births.

A letter was considered from Mrs. C. E. Hobhouse, convener of a conference of voluntary nursing associations held in London in July, 1908, requesting the Board to consider the following resolution unanimously passed by the conference:

That all registrars of births should add in a new column the name, status, and address of the person who delivered the child.

The Board decided that the suggestion be approved, and that the Registrar-General be asked to issue the necessary instructions.

Midwives and Patent Medicine Shops.

A letter was considered from a solicitor acting for a midwife inquiring whether the keeping of a shop for the sale of patent medicines by a midwife would be deemed misconduct within the meaning of Section 3 (v) of the Midwives Act. The Board decided to reply that the keeping of a shop for the sale of patent medicines by a midwife was highly undesirable, and that any midwife so doing acted at her own peril.

Alleged Drunkenness.

The Board considered the report of the Subcommittee on H.R.H. Princess Christian's Maternity Home, and decided that as it appeared on investigation that all usual inquiries were made by the authorities of the home, so much of the Board's resolution of December 17th, 1908, dealing with the question as follows the word "authority" be rescinded—namely, the words "but it also thinks that the authorities of the home will see that it is to their interest to redouble their precautions in selecting women to act as midwives in connexion with the home." The Board also decided that the midwife, under whom one of the individuals concerned in this inquiry was trained, should be required to explain the testimonial, which appears to have misled the authorities of the home.

Section 11 of Midwives Act.

The SECRETARY reported that Jane Emily Inglis, of Leeds, who had pleaded guilty at the Central Criminal Court to an offence under Section 11 of the Midwives Act, 1902, had received from the Recorder the sentence of 21 days' imprisonment.

Vaginal Examinations.

The Board directed that the following leaflet drawn up by the Chairman should be distributed:

Inasmuch as misapprehension seems to exist with regard to the meaning of Rule C 1 (1): "She must have . . . attended and watched the progress of not fewer than 20 labours, making abdominal and vaginal examinations during the course of labour" (see also Schedule, Form III):

The Board wishes to point out that the word "examinations" (in the plural number) is to be taken in connexion with the word "progress," and as implying such a number of examinations as will enable the pupil to "watch the progress" of the labour. The word "frequent" is advisedly not used.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

FLEET SURGEON W. HACKETT, M.D., has been placed on the retired list, at his own request, February 25th. He was appointed Surgeon, February 21st, 1889; Staff Surgeon, February 21st, 1897; and Fleet Surgeon, February 21st, 1905.

Deputy Inspector-General J. J. DENNIS, M.D., has been appointed to Chatham Hospital, February 17th.

Deputy Inspector-General W. EAMES has been appointed to Plymouth Hospital, February 17th.

The following appointments have been made at the Admiralty: Surgeon G. O. M. DICKENSON, M.B., to the *Penelope*, additional, for disposal, February 22nd; Surgeon R. THOMPSON, to the *Aboukir* on re-commissioning, March 9th; Surgeon J. H. WRIGHT, M.B., to the *Suffolk*, March 9th, his appointment to the *Aboukir* being cancelled; Staff Surgeon J. R. MITCHELL, M.B., to the *Penelope*, additional, for disposal, February 15th.

ROYAL NAVAL VOLUNTEER RESERVE.

JOHN H. G. HOWE has been appointed a Surgeon, February 27th.

ROYAL HOSPITAL, CHELSEA.

MAJOR-GENERAL CHARLES CRITCHLEY, M.V.O., from Director of Recruiting at Head Quarters, to be Lieutenant-Governor and Secretary, vice Major-General Sir R. B. Lane, K.C.V.O., C.B., February 19th.

ARMY MEDICAL SERVICE.

LIEUTENANT-COLONEL JAMES WELLS, M.B., from the Seconded List, to be Lieutenant-Colonel, February 20th. He was seconded for service as Principal Medical Officer, East Africa, and Uganda Protectorates, February 20th, 1908.

Lieutenant-Colonel H. J. WYATT retires on retired pay, March 3rd. His commissions are thus dated: Surgeon, August 4th, 1883; Surgeon-Major, August 4th, 1885; Lieutenant-Colonel, August 4th, 1903. He served in the South African war in 1899-1902, and was present in operations in Cape Colony, Orange River Colony, and the Transvaal, receiving the Queen's medal with three clasps, and the King's medal with two clasps.

ROYAL ARMY MEDICAL CORPS.

The undermentioned Lieutenants, on probation, are seconded, under Article 300, Royal Warrant for Pay and Promotion, 1907, dated January 30th: W. H. O'Riordan, C.T. V. BENSON, W. P. McARTHUR, M.B., F. W. M. CUNNINGHAM, M.B., E. M. PARSONS-SMITH, H. R. EDWARDS. Their appointment was notified in the *BRITISH MEDICAL JOURNAL* of February 27th.

INDIAN MEDICAL SERVICE.

SURGEON-GENERAL P. H. BENSON, M.B., Madras, has been awarded a good service pension, vice Surgeon-General J. P. GREASY, M.B., Bombay, retired.

Lieutenant-Colonel C. F. WILLIS, M.D., Bombay, is promoted to be Colonel from November 14th, 1908. He was appointed Assistant-Surgeon, October 31st, 1879, and became Lieutenant-Colonel, October 31st, 1899. His war record is as follows: Egyptian war, 1882, including the battle of Tel-el-Kebir and subsequent occupation of Cairo (medal with clasp and Khedive's bronze star); the campaign on the North-West Frontier of India in 1897-8, including the operations on the Samana and in the Kurram Valley (medal with two clasps); and the Tirah Expedition in 1897-8, when he took part in the reconnaissance of the Kharmana Defile and the action on November 7th, and in the operation against the Khani Khel Chamkani mentioned in despatches, clasp. He has recently been appointed an Honorary Surgeon to the Governor-General of India.

Lieutenant-Colonel W. A. CORKERY, Bombay, is also promoted to be Colonel, from January 1st. He joined the department as an Assistant-Surgeon, April 2nd, 1881, and was made Lieutenant-Colonel, April 2nd, 1901. He was with the Burmese Expedition in 1885-7, receiving a medal with clasp.

IMPERIAL YEOMANRY.

THE resignation of his commission by Surgeon-Major E. C. THOMPSON, M.B., North of Ireland Regiment, which was announced in the *London Gazette* of January 22nd, is cancelled.

TERRITORIAL FORCE.

REAL ARMY MEDICAL CORPS.

First West Lancashire Field Ambulance.—Captain DAVID SMART to be Major, April 1st, 1908.

Second West Lancashire Field Ambulance.—ALAN H. NOBLE to be Transport Officer, with the honorary rank of Lieutenant, January 20th.

Third Northamptonshire Field Ambulance.—GEORGE W. PROWSE to be Transport Officer, with the honorary rank of Lieutenant, November 30th, 1908; WILLIAM A. THOMPSON to be Lieutenant, January 1st, 1909.

Third Southern General Hospital.—The undermentioned to officers whose services will be available on mobilisation, dated March 3rd, 1909: To be Lieutenant-Colonels—W. T. FREEMAN, M.D., F.R.C.S. Eng., F. H. HAWKINS, M.D., W. J. MAURICE, M.B., H. P. STYMONS, F.R.C.S. Edin., To be Majors—G. S. ABRAHAM, M.B., WILLIAM COLLIER, M.D., A. P. DODDS-PARKER, M.B., F.R.C.S. Eng., L. M. GUTLIND, M.B., ERNEST MALLAM, M.D., J. A. P. FRICK, M.D., W. A. P. WATERS, M.D., R. H. A. WHITELOCKE, M.D., F.R.C.S. Eng. To be Captains—E. C. BEYERS, M.B., H. M. CLARKE, M.B., N. B. CLOWES, H. E. CONNELL, F.R.C.S. Eng., C. A. COVENTON, WILLIAM DUNNAN, M.B., W. J. FOSTER, F.R.C.S. Eng., J. C. R. FREEBORN, A. G. GIBSON, M.D., G. H. R. HOLDEN, M.D., R. E. HUMPHRY, G. F. MURRELL, M.B., F. G. PROUDFOOT, M.D., W. B. PROWSE, M.B., ROBERT RITSON, W. E. ROBINSON, M.D., R. H. SEAR, M.B., W. B. SEAR, M.B., F.R.C.S. Eng., W. J. TUBRELL, M.D., A. T. WATERHOUSE, M.B.

For Attachment to Units other than Medical Units.—Surgeon-Lieutenant J. E. PHILLIPS, from the Cheshire (Earl of Chester's) Imperial Yeomanry, to be Lieutenant, January 1st, 1909.

Imperial Yeomanry, dated April 1st, 1908. PERCY T. TOLPITT to be Lieutenant, dated November 26th, 1908. The promotion of Captain H. T. CHALLIS, M.D., to the rank of Major, bears date May 27th, 1905, and not April 1st, 1908, as stated in the *London Gazette* of December 18th, 1908.

Vital Statistics.

VITAL STATISTICS OF METROPOLITAN BOROUGHES DURING 1908.

[SPECIALLY REPORTED FOR THE BRITISH MEDICAL JOURNAL.]

IN the accompanying table will be found summarized the vital statistics of the City of London and of each of the metropolitan boroughs, based upon the Registrar-General's quarterly returns for the year 1908. The mortality figures relate to the deaths of persons acting as belonging to the various boroughs, and are obtained by distributing deaths occurring in institutions to the boroughs in which the deceased persons had previously resided.

The 123,894 births registered in London during 1908 were equal to an annual rate of 25.4 per 1,000 of the population, estimated at 4,795,757 persons in the middle of that year; this rate was lower than that recorded in any previous year, and is 2.8 lower than the average rate for the ten years 1898-1907. The birth-rates last year ranged from 14.4 in Hampstead, 16.6 in the City of London, 15.4 in Westminster, 18.1 in Kensington, 19.0 in Stoke Newington, and 19.3 in

Analysis of the Vital Statistics of the Metropolitan Boroughs and of the City of London after Distribution of Deaths occurring in Public Institutions during 1908.

Chelsea, to 30.7 in Poplar, 30.9 in Shoreditch, 31.7 in Bethnal Green, 32.1 in Bermundsey, 32.3 in St. Marylebone, 32.9 in Stepney, and 36.6 in Finsbury.

The deaths of London residents registered during the year numbered 67,355, and were at the rate of 13.8 per 1,000 persons living, against 15.1 and 14.6 per 1,000 in the two preceding years; the average rate for the ten years 1898-1907 was 16.7 per 1,000. The lowest death-rates last year were 8.5 in Hampstead, 11.0 in Lewisham, 11.4 in Woolwich, 11.6 in Wandsworth, 12.2 in Battersea, and 12.3 in Stoke Newington; the highest rates were 17.1 in Bethnal Green, 17.4 in Shoreditch, 17.7 in the City of London, 18.5 in Finsbury, and 18.8 in Bermundsey.

During the year under notice 6,599 deaths were referred to the principal infectious diseases; of these, 1,524 resulted from measles, 548 from scarlet fever, 724 from diphtheria, 984 from whooping-cough, 225 from enteric fever, 2 from ill-defined pyrexia, and 2,592 from diarrhoea, but not any from small-pox or typhus. These 6,599 deaths were equal to an annual rate of 1.35 per 1,000, or 0.44 per 1,000 less than the average rate for the five years 1903-7. The mortality from scarlet fever exceeded the average; that from diphtheria was equal to the average, as had also been the case in the previous year; while the mortality from each of the other specified diseases showed a decline as compared with the average of the previous five years. Among the several boroughs the death-rates last year from the principal infectious diseases ranged from 0.40 in the City of London and in Hampstead, 0.58 in Westminster, 0.82 in Stoke Newington, 0.85 in St. Marylebone, and 0.87 in Paddington, to 2.49 in Finsbury and in Shoreditch, 2.26 in Poplar, 2.50 in Bermundsey, 2.48 in Bethnal Green, and 2.55 in Stepney. The greatest proportional mortality from measles was recorded in Finsbury, Shoreditch, Bethnal Green, Stepney, Poplar, and Bermundsey. Scarlet fever was proportionally most fatal in Shoreditch, Bethnal Green, Stepney, Poplar, and Bermundsey; 20,852 scarlet fever patients were admitted into the Metropolitan Asylums Hospitals during the year, against 17,592, 18,622, and 23,953 in the three preceding years; 3,498 cases remained under treatment at the end of the year, against 3,490, 3,787, and 4,956 at the end of the three preceding years. The highest number of deaths from scarlet fever was recorded in Hackney, Bethnal Green, Stepney, Poplar, Bermundsey, and Lewisham; there were 6,797 diphtheria patients admitted into the Metropolitan Asylums Hospitals last year, against 5,380, 6,478, and 7,303 in the three preceding years; 1,241 cases remained under treatment at the end of the year, against 701, 995, and 1,168 at the end of the three preceding years. Whooping-cough was proportionally most fatal in St. Pancras, Finsbury, Bethnal Green, Stepney, Poplar, and Greenwich. The greatest proportional mortality from enteric fever was recorded in Chelsea, Stoke Newington, Holborn, Finsbury, Shoreditch, Bethnal Green, and Bermundsey; 708 enteric fever patients were admitted into the Metropolitan Asylums Hospitals last year, against 934 and 768 in the two preceding years; 147 cases remained under treatment at the end of the year, against 134 and 119 at the end of the two preceding years. Diarrhoea showed the greatest proportional fatality in Finsbury, Shoreditch, Bethnal Green, Stepney, Poplar, Southwark, and Wandsworth.

The 6,419 deaths from pneumonia registered during the year were equal to an annual rate of 1.32 per 1,000, the rates in the three preceding years having been 1.42, 1.44, and 1.40 respectively. The pneumonia death-rates last year ranged from 0.73 in Hampstead, 0.85 in Lewisham, 0.86 in Wandsworth, 0.98 in Kensington, 1.01 in Paddington, and 1.07 in Stoke Newington, to 1.79 in the City of London, 1.88 in Southwark, 1.89 in Bermundsey, 2.00 in Shoreditch, 2.11 in Holborn, and 2.15 in Finsbury. The central group of boroughs shows the usual excessive mortality from this disease, the rate being 2.10 per 1,000, against 1.59 in the eastern group, 1.28 in the southern, 1.24 in the northern, and 1.15 in the western group.

Infant mortality, measured by the proportion of deaths among children under 15 years of age to registered births, was equal to 113 per 1,000, against 129, 131, and 116 in the three preceding years; in the ten years 1898-1907 the rate averaged 143 per 1,000. The lowest rates of infant mortality last year were 64 in St. Marylebone, 72 in Hampstead, 80 in Holborn, 87 in Lewisham, 93 in Lambeth, 94 in Woolwich, and 95 in the City of London; the highest rates were 126 in Chelsea, 127 in Poplar, 127 in Stepney, 136 in Bethnal Green, and in Southwark, 144 in Shoreditch, and 146 in Bermundsey.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 8,241 births and 6,024 deaths were registered during the week ending Saturday last, February 27th. The annual rate of mortality in these towns, which had been 17.5 and 18.1 per 1,000 in the two preceding weeks, further rose last week to 19.1 per 1,000. The lowest rates in the several towns ranged from 6.9 in Walthamstow, 7.6 in Hornsey, 10.8 in Barrow-in-Furness, 11.3 in Leyton, 12.0 in York, and 12.3 in Gateshead, to 23.8 in Portsmouth, 24.2 in Wigan, 25.5 in Birmingham, 25.6 in Rochdale, 26.3 in St. Helens, 27.1 in Plymouth, and 29.4 in Aston Manor. In London the rate of mortality was 19.9 per 1,000, while it averaged 18.8 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 1.9 per 1,000 in the seventy-six towns; in London the death-rate from these diseases was 1.8 per 1,000, while among the seventy-five other large towns it ranged upwards to 4.7 in Sheffield, 4.9 in Birmingham, 5.2 in Sunderland, 5.9 in West Ham, 7.9 in Warrington, 8.1 in Southwick, 8.4 in Aston Manor, and 9.9 in St. Helens. Measles caused a death-rate of 3.7 in Sheffield, 3.9 in Stockton-on-Tees and in Sunderland, 4.0 in Birmingham, 5.2 in West Ham, 5.8 in Warrington, 6.6 in St. Helens, 6.7 in Southwick, and 6.9 in Aston Manor; scarlet fever of 1.4 in Bourne, 1.5 in Nottingham, 1.2 in Aston Manor; whooping-cough of 1.4 in Nottingham and in Warrington, 1.8 in Preston, 2.0 in Coventry, 2.2 in St. Helens, and 2.3 in Wigan; "fever" of 1.5 in Hanley; and diarrhoea of 1.5 in Middlesbrough. One fatal case of small-pox was registered in Bristol, but none in any other of the seventy-six large towns. The number of scarlet fever patients remaining under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 3,117, 3,002, and 2,910 at the end of the three preceding weeks, had further declined to 2,825 at the end of last week; 292 new cases were admitted during the week, against 312, 289, and 273 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

During the week ending Saturday last, February 27th, 888 births and 744 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 18.4 and 18.9 per 1,000 in the two preceding weeks, had further rose last week to 20.0 per 1,000, and was 0.9 per 1,000 above the mean rate during the same period in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 12.3 in Leith and 13.5 in Glasgow to 21.6 in Paisley and 21.9 in Dundee. The death-rate from the principal infectious diseases averaged 2.3 per 1,000 in these eight towns; the highest rates being recorded in Dundee and Aberdeen. The 352 deaths from pneumonia included 4 from diphtheria, 2 from whooping-cough, 5 from "fever," and 6 from diarrhoea. Three fatal cases of diphtheria and 2 of whooping-cough were recorded in Edinburgh; 4 of diphtheria, 2 of whooping-cough, and 3 of diarrhoea in Dundee; 3 of measles, 2 of diphtheria, 5 of whooping-cough, and 2 of diarrhoea in Aberdeen; and 2 of whooping-cough in Paisley.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column, advertisements must be received not later than the first post on Wednesday morning.

VACANCIES.

- ARGYLE AND BUTE ASYLUM, Lochgilblhead.—Assistant Medical Officer (male). Salary, £150 per annum.

Parsons-Smith, M.B., B.S.Lond., M.R.C.S., L.R.C.P.; M. W. Baker, B.A.Cantab., M.R.C.S., L.R.C.P.; (Ear) L. S. T. Burrell, M.A.Cantab., M.R.C.S., L.R.C.P.; W. Harries, B.A.Cantab., M.R.C.S., L.R.C.P.; (Children) (Surgical) H. E. Humphrys, B.A.Cantab., M.R.C.S., L.R.C.P.; (Children—Medical) G. Finch, M.R.C.S., L.R.C.P.; F. R. Thornton, B.A.Cantab., M.R.C.S., L.R.C.P.; (Mental) H. A. H. Robson, M.R.C.S., L.R.C.P.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 3s. 6d., which sum should be forwarded in post-office orders or stamps with the notice not later than Wednesday morning, in order to ensure insertion in the current issue.

BIRTHS.

- BOTT.—On February 28th, at 59, Cambridge Terrace, Hyde Park, the wife of Percival G. A. Bott, M.B.Lond., F.R.C.S. Edin., of a son.
- THOMAS.—On February 23rd, 1909, at 22, Walter Road, Swansea, the wife of Frank G. Thomas, B.A., M.B., B.C.Cantab., of a daughter.

MARRIAGES.

- FRANCE—GREIG-SMITH.—At St. Andrew's Church, Mothil, Benal, on February 3rd, by the Rev. R. Yates, William Ashburner, son of the late Charles France, F.R.I.B.A., of Oliver Hill, Horsforth, York, to Eleanor, daughter of the late James Greig-Smith, M.A., M.B., F.R.S.E., Professor of Surgery, University College, Bristol.
- WARD—BARRETT.—On February 11th, at St. Peter's, Bolsoize Square, London, by the Venerable the Archdeacon of Huntingdon, assisted by the Rev. Yeo Ward, M.A., Curate of St. Georges, Triuro (brother of the bridegroom), the Rev. Spencer C. Carpenter, M.A., Warden of Cairns Mission, and the Rev. F. W. Buttle, M.A., James Philip Stephens Ward, M.R.C.S., L.R.C.P., second son of William Philip Ward, Esq., and Mrs. Ward, of Plymouth, to Alice Dorothy, only daughter of Charles E. B. Barrett, Esq., and Mrs. Barrett, of Santos Road, London, S.W., and niece of Major-General Sir Arthur Barrett, K.C.B.

DEATHS.

- BAILLIE.—On February 25th, at the N.V. Fever Hospital, Hampstead, James Hamilton Hall Baillie, M.B., B.Ch. (N.Z.), M.R.C.S., L.R.C.P., D.P.H., in his 32nd year.
- HORROCKS.—On February 28th, after an operation, aged 56 years, Peter Horrocks, M.D.Lond., F.R.C.P.Lond., Consulting Obstetric Physician to Guy's Hospital, seventh son of the late George Horrocks, of Farnworth, near Bolton, 42, Brook Street, W. Interred Norwood Cemetery, March 4th, 1909.

IN MEMORIAM.

- In loving memory of Lieutenant-Colonel Edward Bovill, M.D., F.R.C.S., I.M.S. (retired), who died on March 1st, 1908, at 31, Comeragh Road, West Kensington, aged 61.

DIARY FOR THE WEEK.

MONDAY.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, Cavendish Square, W., 8.30 p.m.—Papers: (1) Gastric Dilatation Associated with Extreme Cyanosis. Mr. G. Templeton. (2) Points in the Surgical Treatment of Fractures of the Base of the Skull (illustrated by lantern slides). Mr. L. B. Rawling.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C., 5 p.m.—Professor Arthur Keith—Lecture I: Congenital Malformations of the Heart.

TUESDAY.

CHLSEA CLINICAL SOCIETY, Chelsea Dispensary, Manor Street, S.W., 8.30 p.m.—Annual Clinical Debate: The Diagnosis and Treatment of Tuberculous Glands of the Neck.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W., 5 p.m.—Third Milroy Lecture by Dr. R. T. Hewlett: Disinfection and Disinfectants.

ROYAL SOCIETY OF MEDICINE: SURGICAL SECTION, 20, Hanover Square, W., 5.30 p.m.—Papers:—Mr. Alban Doran: Urachal Cyst Simulating Appendicular Abscess: Arrested Development of Genital Tract with Notes on Recently Reported Cases of Urachal Cysts. Mr. Herbert T. Herring: The Application of Continuous Suction in Surgery.

WEDNESDAY.

BRITISH BAINEOLOGICAL AND CLIMATOLOGICAL SOCIETY, 20, Hanover Square, W., 5.30 p.m.—Ordinary Meeting. Adjourned Discussion on Dr. Buckley's paper, Intestinal Lavage on the Florentine System, will be reopened by Dr. Mantle (Harrigate). Paper—Mr. Lockhart Munnery: The Treatment of Severe Case of Chronic Colitis. The Fellows will dine together at Pagan's Restaurant, Great Portland Street, W., at 7 p.m.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C., 5 p.m.—Professor Arthur Keith—Lecture II: Congenital Malformations of the Heart.

UNITED SERVICES MEDICAL SOCIETY, Royal Army Medical College, Millbank, S.W., 8.30 p.m.—A Demonstration of Recent Methods of Sewage Analysis, Major Berridge, R.A.M.C. Mr. Bishop Harman will show the Diaphragm Test for Vision.

THURSDAY.

OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM, 11, Chandos Street, W.—Ordinary Meeting. Card Cases, at 8 p.m. Drs. G. Carpenter, G. Rowan, etc. Papers, at 8.30 p.m. Mr. E. Treacher Collins: Congenital Anterior Staphyloptosis. Mr. E. Nettleship: Some New Pedigrees of Eye Disease.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W., 5 p.m.—First Goulstonian Lecture by Dr. A. E. Russell: On Some Disorders of the Cerebral Circulation and their Clinical Manifestations.

ROYAL SOCIETY OF MEDICINE:

OBSTETRICAL AND GYNAECOLOGICAL SECTION, 20, Hanover Square, W., 7.45 p.m.—Specimens:—Mrs. Stanley Boyd: A Neurologic Fibroid. Dr. Rivers Pollock: Dermoid Cysts of the Ovaries. Dr. W. Gifford Nash: (1) Parovarian Cyst with Torsion of the Pedicle; (2) Haemorrhage into Great Omentum due to slight Injury in a Patient with Multiple Myomata of the Uterus; (3) Haemorrhage into a Sarcoma of the Ovary causing Symptoms suggestive of Torsion. Dr. Russell Andrews: (1) Twin Pregnancy in a Fallopian Tube; (2) Carcinoma of Vagina: Removal of the Uterus and Whole of Vagina. Dr. A. H. N. Lewers: A Fibroid of Tumour Spontaneously Expelled from the Uterus Seven and a Half Weeks after Delivery. Dr. H. B. Spenser: (1) An Ovarian Fibroid Incarcerated in the Pelvis. Caesarean Section and Ovariectomy at Term. (2) Bilateral Ovarian Fibroids Removed during Pregnancy. Short Communications:—Dr. Drummond Macwell: Notes on a Fatal Case of Toxic Vomiting of Pregnancy. Dr. F. E. Taylor and Dr. W. E. Fisher: A Case of Primary Ovarian Actinomyosis.

FRIDAY.

OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM, 11, Chandos Street, W., 9 p.m.—Special Meeting.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C., 5 p.m.—Professor Arthur Keith—Lecture III: Congenital Malformations of the Heart.

ROYAL SOCIETY OF MEDICINE:

CLINICAL SECTION, 20, Hanover Square, W.C., 8 p.m.—Cases:—Mr. James Sherron: Cases of Nerve Injury from the Point of View of Treatment. Mr. C. H. Fagge: (1) Two Cases of Post-operative Facial Paralysis: Facial-hypoglossal Grafting; (2) Case of Inflammatory Facial Paralysis. Mr. H. Tubby: Nerve Grafting. Anesthetics. Mr. H. Tubby: Nerve Grafting. Mr. Sargent: Case of Nerve root Grafting. Mr. W. McAdam Eccles: Charcot's Disease of the Ankle. Mr. A. Carless: Vicarious Vomiting by Enterostomy. Case of Enterostomy Cured by Enterostomy. Major C. G. Spencer, R.A.M.C.: Sarcoma Treated by Coley's Fluid. Dr. Macnaughton-Jones: Cancerous Tumour of the Spinal Meninges in a Child. Case of Cancerous Paraplegia Secondary to Mammary Carcinoma. Dr. F. H. Hawkins: Lymphadenoma with Varying Jaundice. Mr. L. McGavin: Perineal Hernia. 9.40 p.m. Short Paper:—Dr. A. E. Garrod: Cræmia Simulating Meningitis.

POST-GRADUATE COURSES AND LECTURES.

CENTRAL LONDON THROAT AND EAR HOSPITAL, Gray's Inn Road, W.C.—Tuesday and Friday, 3.45 p.m., Larynx.

LONDON SCHOOL OF CLINICAL MEDICINE, Stenden's Hospital, Greenwich.—Daily attendances: Out-patient Demonstrations, 10 a.m.; Medical and Surgical Clinics, 2.15 p.m. and 3.15 p.m. respectively. Operations, 2 p.m. Special Clinics: Ear and Throat, at noon and 4 p.m. Monday, and noon, Thursday; Skin, at noon and 4 p.m. Thursday, and noon, Friday; Eye, 11 a.m., Wednesday and Saturday; Radiography, 4 p.m., Thursday. Special Lectures: Monday, 3.15 p.m., Difficulties in Cases of Abdominal Diagnosis; Tuesday, 2.15 p.m., Mital Disease; Wednesday, 3.30 p.m., Papillitis.

LONDON THROAT HOSPITAL, Great Portland Street, W.—Wednesday, 5 p.m., Surgical Landmarks of Nose and Throat.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chancery Street, W.C.—The following clinical demonstrations have been arranged for next week, at 4 p.m. each day: Monday, Skin; Tuesday, Medical; Wednesday, Surgical; Thursday, Surgical; Friday, Throat. Lectures, at 5.15 p.m. each day, will be given as follows: Monday, The Fundus Oculi, with lantern slides; Tuesday, Pruritus Vulvae, its Causes and Treatment; Wednesday, Vesical Tuberculosis; Thursday, Bullous Eruptions.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.—Tuesday, 3.30 p.m., Clinical Lecture; Friday, 3.30 p.m., Symptom and Treatment of Cervical Ribs.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, Middlesex, Clinics, 10 a.m. Surgical Out-patient, 2.30 p.m. Medical Out-patient; Nose, Throat, and Ear; X Rays; 4.30 p.m. Medical In-patient. Tuesday, 10 a.m., Medical Out-patient Clinic; 2.30 p.m., Operations; Clinics: Surgical, Gynaecological; 4.30 p.m., Lecture: Modern Views on Heredity. Wednesday, 2.30 p.m., Medical Out-patient, Skin, and Eye Clinics. Thursday, 2.30 p.m., Gynaecological Operations; Clinics: Medical Out-patient, Surgical Out-patient, X Rays; 3 p.m., Medical In-patient; 4.30 p.m., Lecture-Demonstration: The Mechanism of Infection. Friday, Clinic: 10 a.m., Surgical Out-patient; 2.30 p.m., Medical Out-patient; Medical Out-patient, Eye; 3 p.m., Medical In-patient.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith, W.—The following are the arrangements for next week: Daily, 2 p.m., Medical and Surgical Clinics, X Rays; 2.30 p.m., Operations; Monday and Thursday and Wednesday and Saturday, 2 p.m., Diseases of the Eyes; Tuesday and Friday, 10 a.m., Gynaecological Operations; 2 p.m. (on Wednesday and Saturday, 10 a.m.) Diseases of Throat, Nose, and Ear; 4.30 p.m., Skin Diseases; Wednesday and Saturday, 10 a.m., Diseases of Children; 2.30 p.m., Diseases of Women. Lectures, at 10 a.m. Monday and Thursday, Demonstration by Surgical Registrar; Friday, Demonstration by Medical Registrar; at 12 noon, Monday, Pathological Demonstration; at 12.15 p.m., Practical Medicine; at 5 p.m., Monday, Clinical Pathology; Tuesday, Thursday, Clinical Pathology; Wednesday, Medicine; Thursday, Diagnosis of Swellings in the Jaws in Adults; Friday, the Treatment of Constipation.

ST JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, Leicester Square, W.C.—Thursday, 6 p.m., Ulerythema.

ANNUAL MEETING, BRITISH MEDICAL ASSOCIATION, BELFAST, 1909.

THE Seventy-seventh Annual Meeting of the British Medical Association will be held at Belfast from July 23rd, to July 31st, 1909, under the Presidency of Sir William Whitla.

The Annual Representative Meeting commences in Belfast on July 23rd. The Presidential Address will be delivered on July 27th. The Sections will meet on July 28th, 29th, and 30th.

A preliminary programme of arrangements was published in the SUPPLEMENT, February 27th, 1909. The Honorary Local Secretaries are: Henry Lawrence McKisack, M.D., M.R.C.P., 17, University Square, Belfast; Cecil Edward Shaw, M.A., M.D., M.Ch., 29, University Square, Belfast and Howard Stevenson, B.A., M.B., F.R.C.S.I., 2, College Square North, Belfast.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

THE British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the BRITISH MEDICAL JOURNAL is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if election, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent by the Branch Secretary to the General Secretary of the Association, and to every

Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signature as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the BRITISH MEDICAL JOURNAL for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

GRANTS AND SCHOLARSHIPS FOR SCIENTIFIC RESEARCH.

GRANTS.

THE Council of the British Medical Association is prepared to receive applications from members of the Medical Profession for Grants in aid of Researches for the Advancement of Medicine and the Allied Sciences.

The Grants are made subject to the following conditions:

1. That the work of the Grantee shall be subject to inspection by the Science Committee of the Association.

2. That each Grantee shall furnish to the Science Committee, on or before May 15th following the allotment of the grant, a report (or, if the object of the grant be not then attained, an interim report, to be renewed not later than the same date in each subsequent year until the final report is presented) containing:

(a) A statement, in a form satisfactory to the Science Committee, of the results arrived at, or the stage which the inquiry has reached;

(b) A statement of expenditure incurred, accompanied by vouchers as far as possible;

(c) A reference to any Transactions, Journals, or other publications in which the results of the research have been announced.

SCHOLARSHIPS.

THE Council of the British Medical Association is also prepared to receive applications for Research Scholarships, as follows:

1. AN ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.

2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research in Anatomy, Physiology, Pathology, Bacteriology, State Medicine, Clinical Medicine, or Clinical Surgery.

Each Scholarship is tenable for one year, but is renewable by the Council, provided that the whole period of tenure shall not exceed three years.

The Scholarships are awarded subject to the following conditions:

1. That the work of the Scholar shall be subject to inspection by the Science Committee of the Association.

2. That he shall furnish the Science Committee, on or before May 15th following the grant of the Scholarship, with a statement of the work done by him.

3. That he sign an undertaking to abide by the above and other regulations affecting Scholarships, a copy of which will be supplied to him.

Applications.

Applications for Grants and Scholarships for the year 1909-10 must be made, not later than May 27th, 1909, in the prescribed form, a copy of which will be supplied on application to the Medical Secretary, 429, Strand, London, W.C.

Each application should be accompanied by a recommendation from the head of the laboratory in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

J. SMITH WHITAKER, *Medical Secretary.*

429, Strand, W.C.,

March, 1909.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

EDINBURGH BRANCH.

THE winter clinical meeting of the Branch was held in the Royal Infirmary, Edinburgh, on Friday, February 26th, and was attended by about 150 members.

Museum.—In the museum, which, as usual, was a centre of attraction, many excellent exhibits were on view. Special reference must be made to a beautiful series of casts representing varieties of skin diseases shown by Dr. CRANSTON LOW. An interesting microscopical demonstration was given by Dr. FORD ROBERTSON and Miss M. C. W. YOUNG of tumours produced in mice by the action of carcinomatous material taken from the human subject, and, in addition to this, they also showed sections of malignant tumours which demonstrated the supposed parasites. Dr. SHENNAN demonstrated the living *Spirochaeta pallida*. Mention must also be made of a fine exhibition of transparencies of various pathological conditions, which were hand-painted, by Mr. RICHARD MUIR. While special reference has been made to the above, there were a number of other valuable pathological specimens shown.

Clinical Meeting.—The clinical meeting in the afternoon was well attended, and cases of special interest were demonstrated by various members of the hospital staff.

Dinner.—In the evening the members dined at the Royal British Hotel, covers being laid for sixty. The President (Mr. George A. Berry, F.R.C.S.E.) occupied the chair, and a very enjoyable evening was spent. The toast of "The Imperial Forces" was replied to by Lieutenant-Colonel HEUSTON, C.M.G., R.A.M.C.; while "The British Medical Association" was proposed by Dr. C. E. DOUGLAS of Cupar, his speech being much appreciated by the audience. Dr. DE WATTEVILLE, President of the Northern Counties Branch, replied, "The Health of the President" was given by Dr. JAMES CARMICHAEL. Some excellent songs were sung by Dr. Kennedy and Dr. de Watteville.

GLASGOW AND WEST OF SCOTLAND BRANCH:

GLASGOW NORTH-WESTERN DIVISION.

A MEETING of this Division was held in the Burgh Hall, Hillhead, on Wednesday, March 3rd, at 8.30 p.m., Dr. JOHN MORTON in the chair, with a fair attendance of members.

Confirmation of Minutes.—The minutes of the last meeting were read and approved.

Draft Charter.—The SECRETARY reported on the steps taken with regard to the matter of the Charter, in accordance with the resolution passed at the last meeting. After recalling that he had requisitioned a meeting of the Branch, at which a postal vote was determined on, and that on a majority having declared in favour of petitioning in favour of certain alterations in the Charter, the Branch Council had found their hands tied by the opinion of counsel sent from the Central Office in London, it was intimated that an opportunity would be given for individual members to sign a similar petition in their private capacities.

Whole-time Medical Officers.—A communication from the Public Health Committee was read, and the Division was asked to give its opinion as to whether medical officers of health should be debarred from engaging in private practice. After a short debate the meeting decided that circumstances varied so much in different localities that no definite pronouncement could be made at present.

The Divisions and Scientific Work.—A communication from the Science Committee was read, giving information and suggestions about grants for scientific work undertaken by Divisions; about development of local medical libraries in association with the Central Library in London about co-operation with the work of the Sections

at the Annual Meeting; and about local scientific committees. After some discussion the Secretary was instructed to make inquiries as to the existence and constitution of any local medical library.

The Divisions and the General Practitioner.—Dr. Whitehouse sent notice that he would at the next meeting introduce a discussion on the subject, Do the Divisions of the British Medical Association meet the local requirements of the general practitioner?

Reports of Cases.—Dr. W. A. CASKIE read a report on 2 cases of abscess of the liver, which presented points of considerable interest. These were discussed at some length and comments were made as to their probable origin. Dr. A. MICHAN reported the case of a lady who had suffered for years from inoperable recurrent cancer, and who, in order to relieve the pain, had used increasing quantities of morphine, until at last she had injected hypodermically as much as 65 grains of acetate of morphine a day. She had always shown remarkable tolerance for the drug. Dr. EDMISTON instanced a case of his where as much as 80 grains had been given; Dr. CASKIE recalled a patient who used 8 oz. of tincture of opium in two days, and Dr. BRUCE instanced a case he had known of a child of 10 getting six pennyworth of opium a day. In all these cases the tolerance had been striking.

SOUTH WALES AND MONMOUTHSHIRE BRANCH: SWANSEA DIVISION.

Medical Inspection of Schools.

A MEETING of this Division was held at the Swansea Hospital on February 5th, at which the "Report of the Medico-Political Committee on Medical Inspection of School Children and Treatment of those found Defective" was discussed. Eighteen members were present. The following resolutions were passed *nem. con.*:

1. That for medical inspection of school children this Division recommends the appointment of *part-time* school medical inspectors for the county.
2. That this Division recommends the appointment of *part-time* school medical inspectors for the boroughs.
3. That payment for inspection of school children according to the card be per head of children examined at the school, but that for other duties payment be based upon the time spent.
4. That the minimum rate of payment be 1s. 6d. per head of children examined.
5. That the minimum rate of payment for extra duties be 12s. 6d. per hour.
6. That in cases where whole-time medical inspectors are employed the minimum payment be £500 per annum for the school medical officer, and £250 per annum for junior or assistant school medical officer.

On the question of treatment of school children found defective the following resolutions were passed:

7. That this Division does not approve the establishment of school clinics *within the area of the Division*.
8. That the active treatment of physically defective school children should not be undertaken by medical inspectors of schools.
9. That in all diseases or defects the parents should be referred to their own medical attendant, who alone should decide *what* treatment should be given and where it is desirable that such treatment should be given.
10. That cases having no medical attendant and being too poor to pay for advice should be referred to the Poor Law Medical Officer.
11. That the Division does not approve of any payment being made to hospitals by public authorities for the treatment of school children found defective.

In reply to "Questions of Fact" appended to the letter of the Medical Secretary of December 22nd, 1908, the following information has been obtained:

Within the area of this Division there are three local education authorities—

- (i) That of the County Borough of Swansea.
- (ii) That of the Borough of Neath.
- (iii) That of the County of Glamorgan.

1 and 2. In *Swansea* the medical officer of health (Dr. D. J. Morgan) has been appointed the medical inspector of school children. His appointment as medical officer of health is a whole-time one, and he has only been appointed about a year ago at a salary of £500 per annum. The terms on which he was appointed were that his duties should include those of medical inspector of school

children. The actual work of medical inspection is performed by ten general practitioners resident in the town, to each of whom are allocated one or two schools. They are at present examining the *whole* of the children in the schools at a remuneration of 9d. per head, including all the extra duties, although they have never been called upon to do anything besides the examination by card. This arrangement is only temporary until July next. After that date it is probable that one whole-time and two part-time medical inspectors will be appointed, the medical officer of health still doing the work of supervision. This arrangement has not, however, yet been definitely decided upon.

In *Neath* the medical officer of health for the borough (Dr. J. M. Morris) has been appointed medical inspector of school children, and does all the work himself. He is paid at the rate of 1s. 6d. per head of children on the school books, but at present is only examining those entering and those leaving the school.

In the *County of Glamorgan* the medical officer of health for the county (Dr. W. Williams, of Cardiff) is the medical inspector, doing the work of supervision (remuneration not ascertained). The actual work of inspection is performed by three whole-time medical inspectors, paid at the rate of £250 per annum.

3. In *Swansea* and *Neath* the work undertaken may include all the extra duties referred to in paragraph 7 (4) of the Board of Education Circular No. 596, and no provision made for extra expenses in the remuneration of the school inspectors.

4. No assistant medical officer of health has been appointed for the inspection of school children by any of the authorities in the area of this Division.

5. At *Neath* there is a school nurse who visits the homes of the children.

In *Swansea* at present there is no school nurse appointed.

6. In *Swansea* the eye department of the General Hospital has had a large number of children to treat as the result of school inspection, but no arrangement has been made by the education authority.

As to certificates from hospitals, there is only one hospital in the area of the Division which is concerned—the *Swansea General Eye Hospital*—and the answer of the Secretary to the questions in the circular letter have been forwarded to the Medical Secretary.

 To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

NOTICE OF CHANGES OF BOUNDARIES OF DIVISIONS.

NOTICE OF THE FORMATION OF A NEW DIVISION OF THE ASSOCIATION.

BUCKINGHAMSHIRE DIVISION.

The following change has been made in accordance with the Regulations of the Association, and takes effect from the date of publication of this notice:

That the *Aylesbury Division* cease to exist, and that a *Buckinghamshire Division* be formed, composed of the Members of the Association who reside in the area bounded on the north by a line passing from east to west through *Fenny Stratford* and *Buckingham*, and including *Brackley* in *Northamptonshire*; on the south by the towns on the Great Central Railway—*Gerrard's Cross*, *Beaconsfield*, *High Wycombe*, and *Princes Risborough*; on the east by the *Buckinghamshire County boundary*, but including *Leighton Buzzard*; and on the west by the *Buckinghamshire County boundary*; the Division to form part of the *South Midland Branch*, and the boundaries of that Branch and of the *Metropolitan Counties* and *Oxford* and *Reading Branches*, and of the several Divisions affected to be altered accordingly.

BRANCH AND DIVISION MEETINGS TO BE HELD.

GLOUCESTERSHIRE BRANCH.—A general meeting of the Branch will be held at the General Hospital, Cheltenham, on Thursday, March 18th, at 7 p.m. Agenda: (1) Minutes of last meeting. (2) Dr. S. M. Hebbethwaite: A Case of Achromatopsia. (3) Dr. Arthur Cardew: Pathological specimens; Ovarian Cyst. (4) Dr. C. Braine-Hartnell: The Early Diagnosis and Treatment of Some Forms of Pelvic Obstruction. The Secretary will be pleased to hear from any member who will show cases or pathological specimens at future meetings during this session. There will be a supper afterwards at the *Cosy Corner*, Promenade (tickets 3s. 6d. each, exclusive of wine).—D. E. FINLAY, Honorary Secretary, Gloucester.

LANCASHIRE AND CHESHIRE BRANCH: ALTRINCHAM DIVISION.—A general meeting will be held at the Greenbank Hotel, Northwich, at 5 p.m., on Wednesday, April 21st, to receive reports from the Executive Committee, to consider matters referred to Divisions, and to transact the usual business. At 6 p.m. Dr. Manwaring White will read a paper on *Frontal Sinusitis as a Complication of Influenza*. Dinner at 7 p.m.—T. W. H. GARSTANG, Honorary Secretary.

LANCASHIRE AND CHESHIRE BRANCH: LEIGH DIVISION.—A general meeting of this Division will be held on Thursday, March 18th, in the Co-operative Rooms, Ellesmere Street, Leigh, at 8.30 p.m. Agenda: (1) Minutes. (2) The Surgical Treatment of Goitre and Exophthalmic Goitre, with Cases. (3) Report on Contributions to Hospitals by Employers of Labour and Employees. (4) The Leigh Carters' Sick Club. (5) Any other matters.—G. H. SHAW, Honorary Secretary.

LANCASHIRE AND CHESHIRE BRANCH: ROCHDALE DIVISION.—A joint meeting of the Bury and Rochdale Divisions will be held in the Navigation Hotel, Railway Street, Heywood, on Wednesday, March 17th, at 8.30 p.m. Business: (1) Address by Dr. Garstang, member of Central Council. (2) Grouping of Divisions. (3) Election of Representative and Deputy Representative to Representative Meeting. (4) Matters referred from Head Quarters. (5) Any other business.—JAMES MELVIN, Honorary Secretary, Rochdale.

OXFORD AND READING BRANCH: OXFORD DIVISION.—The next general meeting of this Division will be held on Friday, March 26th, at the Radcliffe Infirmary, Oxford, at 5 p.m. Agenda: (1) Dr. Collier will propose the following resolution: "That in view of the practical experience of the last thirty-seven years, during which period the Association has enjoyed great financial prosperity, it has been proved that in the best interests of the British Medical Association it is essential to have an official with the rank and status of 'General Secretary and Manager,' and that such official should possess special business training. Further, that having regard to the highly satisfactory manner in which Mr. Gray Elliston has discharged the duties since his appointment in 1902, it is in the interests of the Association that his services should be retained as General Secretary and Manager; and that the Representative of the Oxford Division to the Representative Meeting at Belfast be instructed accordingly." (2) Certain business matters referred to the Divisions will be laid before the meeting by the Secretary. (3) Specimens and cases will be shown. (4) Robert Hutcheon will open a discussion on all subject connected with dietetics.—W. DUGAN, Honorary Secretary.

Hospitals and Asylums.

ROYAL HALIFAX INFIRMARY.

THE report presented to the annual meeting of the governors of this infirmary disclosed no very new feature. The number of persons treated during the year was 16,617, compared with 9,899 in the previous year. Of these, 1,960 were in-patients, as against 1,872 in the preceding year. The average duration of treatment of in-patients had been 20.3 days, and the rate of mortality 7.2 per cent.; or, deducting 32 patients who died within twenty-four hours of admission, 5.6 per cent. The average cost of in-patients was £3 18s. 6d., as against £3 13s. 8d. in 1907, the average retention of each in-patient being two and a half days less than in that year. The average cost per occupied bed per annum was £70 17s. compared with £62 13s. 5d. in the previous year, this being due to the enhanced prices which had to be paid for practically everything used in the hospital.

AYR DISTRICT ASYLUM.

THE annual report of this institution contains the financial statistics for the year ending May 15th, 1908, and the medical and administrative statistics for the year ending December 31st, 1908. Dr. Douglas McRae, appointed last year to be Medical Superintendent in place of Dr. Easterbrook, reports that there were 499 patients on the asylum register on January 1st, 1908, and 537 on the last day of the year. The total cases under treatment during the year numbered 657, and the average number daily resident 522.73. During the year 158 were admitted, being less by 40 than the total number admitted in 1907. Among the 1907 admissions there were 30 out-county patients, which reduces

the actual decrease of admissions to 10. Of the 158 admissions 122 were first and 36 not-first admissions. In 35 the attacks were first attacks within three, and in 15 more within twelve months of admission; in 32 not-first attacks within twelve months of admission and in the remainder, whether first attacks or not, the illness was either of more than twelve months' duration (65) or of congenital origin (11) on admission. As an off-set against the smaller number of admissions in 1908, the patients were mostly in poor physical health and contained a high proportion of cases of incurable forms of insanity. Of the whole number of admissions only 8 were in average health and condition, 89 being in indifferent health and reduced condition and 61 in bad health and exhausted physically. With regard to the forms of mental disorder, the admissions were classified into: Mania of all forms, 53; melancholia of all forms, 59; secondary, senile, organic, epileptic, and alcoholic dementia, 31; general paralysis, 8; acquired epilepsy, 5; and cases of infantile or congenital defect, 11. In all, Dr. McRae says, 48 per cent. of the admissions were of a hopeless character. As to the probable etiological factors, alcoholic excess was assigned in 40, or 25.3 per cent.; syphilis in 11, critical periods in 50, previous attacks in 39, pregnancy, lactation, and the puerperium in 12, phthisis in 9, and mental stress in 3. Hereditary influences were ascertained in 64, or 40 per cent. During the year 36 were discharged as recovered, giving a recovery-rate on the admissions of 22.78 per cent., which is by far the lowest recovery-rate recorded at this asylum. There were also 12 discharged as relieved and 3 as not improved. During the year 69 died, giving a death-rate on the average numbers resident of 13.19 per cent.—a death-rate which has only been exceeded on two occasions since the asylum was opened in 1869. The deaths were due in 29 cases to nervous diseases, alone or combined with tuberculosis, including 10 cases of general paresis; in 20 to chest diseases, including 15 deaths from pulmonary consumption; in 5 to abdominal diseases; and in the remainder to general diseases, including 12 deaths from senile decay and 2 from general tuberculosis. Altogether 21, or 30.4 per cent., of the total deaths were from some form of tuberculosis. Of these tuberculous cases Dr. McRae says that 11 showed evidences of the disease on admission, but that in the 10 remaining it appeared to have developed after admission. A widespread epidemic of influenza occurred during the first quarter of the year, but otherwise the general health appears to have been good. The asylum was visited by the Commissioners in Lunacy, who reported upon the general excellence of management of the asylum and the high professional skill which characterized the medical treatment of the patients.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

THE following appointments have been made in the Admiralty: Surgeon J. H. BURDETT, to the *Victoria*, additional, for Hester Hospital, March 1st; Fleet Surgeon JOHN MEXARY, M.D., to the *Fengance*, on re-commissioning, undated; Staff Surgeon J. W. V. STANTON, to the *President*, additional, for three months, to take place at the London Hospital, March 12th; Staff Surgeon R. A. ROSS, M.D., to the *Victoria*, March 12th; Staff Surgeon M. C. LANGFORD, to the *President*, additional, for survey of stores at Yarmouth Hospital from March 12th to March 31st inclusive; Staff Surgeon W. H. HASTINGS, M.B., to the *Surprise*, on re-commissioning, March 27th; Surgeon G. A. BRADSHAW, to the *Antrim*, March 27th.

ARMY MEDICAL SERVICE.

SURGEON-GENERAL G. D. BOURKE, C.B., is appointed an Honorary Physician to the King, vice Surgeon-General T. Tarrant, C.B., deceased, February 3rd. Surgeon-General Bourke was appointed Surgeon, September 30th, 1874; Surgeon-Major, September 30th, 1882; and the rank of Lieutenant-Colonel, September 30th, 1894: made Brigade Surgeon-Lieutenant-Colonel, April 15th, 1898; and promoted to be Surgeon-General, September 19th, 1907. His war record is as follows: Nile expedition, 1884-5 (medal with clasp), and Kitchener's bronze star; the Sudan Frontier Field Force, 1885-6, including the action of Ginnis; the Burmese campaign in 1887-9 (medal with clasp); the Chin-Lushai expedition, 1889-90 (mentioned in despatches, clasp); the Tirah Expeditionary Force, North-West Frontier of India, 1897-8 (mentioned in despatches, medal with two clasps). He was nominated C.B., June 28th, 1907.

INDIAN MEDICAL SERVICE.

SURGEON-GENERAL P. H. HENSON, M.B., Madras, is granted combined privilege leave and leave on private affairs to Europe for six months, from March 1st.

Lieutenant-Colonel P. J. LUDSEN, M.B., Benhal, is posted as Residency Surgeon, Hyderabad, from January 5th.

The undermentioned Captains are promoted to be Majors, from January 28th: J. M. WOOLLEY, M.B.; C. A. LANE, M.D.; T. B. KELLY, W. H. KERRICK, C. H. WATSON, E. F. E. BAINES, G. O. P. SEALY, S. ANDERSON, M.B.; F. H. G. HUTCHINSON, M.B.; J. L. MARJORIBANKS, M.B.; A. FENTON, M.B.; R. W. KIRK, M.B. The first appointment is Majors Woolley, Lane, Kelly, Kerrick, Watson, Baines, and Sealy is dated January 28th, 1897; that of Majors Anderson, Hutchinson, Marjoribanks, Fenton, and Knox, July 28th, 1897. Such as have war records are as follows: Major Woolley, Hutchinson and Fenton—China war, 1900 (medal). Major Lane—Burmese expedition, 1887-9 (medal with clasp). Major Kelly—Tibet, 1903-4, including the operations at and around Gyantse (slightly wounded, mentioned in despatches, medal with clasp). Major Watson—North-West Frontier of India campaign, 1897-8, including the operations on the Kurram Valley (medal with two clasps). Tirah expedition, 1897-8, present in the action of Dargai and at the capture of the Samagha and Abangha Passes (clasp); China war, 1900, including the relief of Peking

and the actions of Peitsang and Yangtun (mentioned in despatches, medal with clasp). Major Anderson—China war, 1900 (medal); Waziristan expedition, North-West Frontier of India, 1901-2 (medal with clasp).

Lieutenants E. J. C. McDONALD and W. D. WRIGHT, M.B., are promoted to be Captains, from September 1st, 1908, their first commissions being dated September 1st, 1905.

The following Lieutenants are promoted to be Captains, from February 1st: H. W. PREPONT, V. D. H. STUTTEMAN, M.B., H. P. COOR, M.B., W. J. FRASER, M.B., C. C. V. FITZGERALD, R. S. KENNEDY, M.B., B. HIGHAM, M.B., D. A. GOSNOL, R. H. LEE, M.B., T. HEFFERNAN, M.B., H. S. HUTCHINSON, M.B., R. G. G. CROLY, M.B., S. C. CROFT, W. B. K. C. CROFT, M.B., J. MACG. SKINNER, M.B. They were appointed Lieutenants February 1st, 1905.

The promotion of Lieutenant-Colonel A. M. CROFTS, C.I.E., Bengal, to be Colonel, which has been already announced in the *BRITISH MEDICAL JOURNAL*, has received the approval of the King.

His Majesty has likewise sanctioned the provisional promotion to be Captain of Lieutenant J. F. BOYD, also previously announced in the *BRITISH MEDICAL JOURNAL*.

Lieutenant V. J. WIDEMORE is promoted to be Captain, from September 1st, 1908. He was appointed Lieutenant September 1st, 1905.

The undermentioned gentlemen are appointed Lieutenants, dated August 1st, 1908: RICHARD B. LLOYD, M.P., ARCHIBALD C. MORRO, M.B., H. M. CHOPRA, M.B., ALISTAIR A. M. GIBSON, M.B., G. JOLLY, M.B., HUGH STOTT, M.B., ALISTAIR A. C. MCNEILL, M.B., ROBERT L. GAMLEN, ARDES S. KILAN, GEORGE F. GRAHAM, M.B., MANICK D. WADIA, TAYLOR D. MURISON, SOHRAB S. VAZIFAR, JOHN H. NICHOLSON, M.B., EDWARD S. PRITTON, M.B., CLARE F. S. SMITH, M.B., STRENSAR SARKAR, ARTHUR J. SYMES, M.B., GERALD L. C. LITTLE, M.B., and THOMAS C. ROYD.

TERRITORIAL FORCE.

YEOMANRY.

SURGEON-LIEUTENANT R. M. MCQUEEN, from the City of London (Roughriders) Imperial Yeomanry, to be Surgeon-Lieutenant, City of London (Roughriders), with precedence as in the Imperial Yeomanry, April 1st, 1908. Surgeon-Lieutenant McQueen is promoted to be Surgeon-Captain, January 1st, 1909. The announcement of the appointment of Surgeon-Lieutenant McQueen, which appeared in the *London Gazette* of October 20th, 1908, is cancelled.

ROYAL FIELD ARTILLERY.

SURGEON-LIEUTENANT G. SEARLE, 4th Wessex Brigade, resigns his commission, retaining his rank and uniform, January 27th.

ROYAL ARMY MEDICAL CORPS.

First Scottish General Hospital—Lieutenant-Colonel J. M. BOOTH, M.B., from the list of officers whose services will be available on mobilization, to be Lieutenant-Colonel, March 5th. Lieutenant-Colonel G. E. SPENCER, an officer whose services will be available on mobilization, March 6th.

Vital Statistics.

ENGLISH URBAN MORTALITY DURING 1908.

“SPECIALLY REPORTED FOR THE BRITISH MEDICAL JOURNAL.”

IN the accompanying table will be found summarized the vital statistics of the seventy-six large towns dealt with in the Registrar-General's weekly returns. During the fifty-three weeks ending January 2nd 445,503 births were registered in these towns, equal to an annual rate of 26 per 1,000 of the population, compared with 26.2 persons in the middle of last year; in the three preceding years the rates were 28.2, 27.9, and 27.0 per 1,000 respectively. In London the rate was 25.4 per 1,000, while it averaged 27.6 in the seventy-five other large towns, and 26.5 in the 155 in the remainder of the country. In Birmingham, 29.0 in Halifax, 20.2 in Bradford, 20.9 in Northampton, 21.3 in Brighton, to 33.0 in Hanley and in Sunderland, 33.1 in Swansea, 34.3 in Tynemouth, 37 in St. Helens, 35.6 in Merthyr Tydfil, 35.9 in Middlesbrough, and 40.3 in Rhondda.

During the period under notice 246,019 deaths were registered in these seventy-six towns, corresponding to a rate of 14.9 per 1,000 living, against 15.7, 15.9, and 15.4 per 1,000 in the three preceding years. In London the rate of mortality was 13.8 per 1,000, while it averaged 15.4 in the seventy-five other large towns, and ranged from 8.3 in Horsey, 10.3 in East Ham, 10.4 in Leyton and in King's Norton, 10.5 in Willesden and in Walworth, and 10.7 in Handsworth (Staffs), to 18.4 in Hanley, in Rochdale, and in Rhondda, 18.5 in Swansea, 19.1 in Merthyr Tydfil, 19.2 in Laverpool, and 18.8 in Oldham and in Middlesbrough.

The 246,019 deaths from all causes in these towns last year included 26,116 which were referred to the principal infectious diseases; of these one-ninth, or 2,878 from small-pox, 5,069 from measles, 1,718 from scarlet fever, 2,578 from diphtheria, 751 from whooping-cough, 1,251 from typhoid (principally enteric), and 10,748 from diarrhoea. The death-rate from these diseases in the aggregate was 1.59 per 1,000 last year, against 1.88, 2.24, and 1.54 in the three preceding years. Compared with the average rates for the five years 1903-7 the mortality from each of these infectious diseases was below the average. In London these diseases caused a death-rate last year of 1.35 per 1,000; in the seventy-five other large towns the rate averaged 1.67 per 1,000, and ranged from 0.40 in Hastings, 0.57 in Horsey, 0.64 in Brighton, 0.71 in Northampton, 0.75 in Northampton, 0.72 in West Hartlepool, and 0.82 in Leyton, to 2.49 in Merthyr Tydfil, 2.50 in Bootle and in Oldham, 2.70 in Stockton-on-Tees, 2.80 in Burnley, 2.98 in Rotherham, 3.04 in Salford, 3.47 in Middlesbrough, and 3.49 in Rhondda. The 5,069 fatal cases of measles were at a rate of 0.31 per 1,000; in London also the death-rate from this disease was 0.31 per 1,000, while in the seventy-five other large towns it was highest in West Ham, Leicester, Rochdale, Preston, Rotherham, Middlesbrough, Stockton-on-Tees, and Rhondda. The four deaths from scarlet fever corresponded to a rate of 0.10 per 1,000; in London the mortality from this cause was at the rate of 0.11 per 1,000, while it averaged 0.10 in the seventy-five other large towns, among which this disease was proportionally most fatal in West Bromwich, Stockport, Wolverhampton, St. Helens, Warrington, and Salford. The 2,578 fatal cases of diphtheria were equal to a rate of 0.16 per 1,000; in London the rate was 0.15 per 1,000, while it averaged 0.16 in the seventy-five other large towns, and was highest in Stockport, East Ham, Leeds, Wolverhampton, West Bromwich, King's Norton, Derby, Salford, and Middlesbrough. The 4,751 deaths from whooping-cough corresponded to a rate of 0.29 per 1,000; in London this disease caused a death-rate of 0.20 per 1,000.

Analysis of the Vital Statistics of Seventy-six of the Largest English Towns during 1908.

Towns.	Estimated Population middle of 1908.	Births.	Deaths.	Annual Rate per 1,000 Living.		Deaths from Principal Infectious Diseases.	Deaths from Principal Non-infectious Diseases.	Small-pox. while in the seventy-five other large towns the rate averaged 0.32 per 1,000, the greatest proportional mortality being recorded in Birmingham, Aston, Manor, Bockley, Warrington, Roddham, Stockton-on-Tees, Sunderland, Newport (Mon.), and Merthyr Tydfil. The 1,251 deaths referred to different forms of "fever" were equal to a rate of 0.08 per 1,000; in London the rate was only 0.05 per 1,000, while it averaged 0.09 in the seventy-five other large towns, and was highest in Norwich, Devonport, Hanley, Grimsby, Wigan, Bolton, Salford, Preston, and Rotherham. The 10,748 fatal cases of diarrhoea corresponded to a rate of 0.65 per 1,000; in London the diarrhoea death-rate was 0.53 per 1,000, while it averaged 0.70 in the seventy-five other large towns, among which diarrhoea was proportionally most fatal in West Ham, Walsall, Stockport, Oldham, Burnley, Rotherham, Hull, Middlesbrough, and Rhondda. The fatal case of small-pox belonged to Birmingham.

Infant mortality, measured by the proportion of deaths among children under 1 year of age to registered births, was equal to 128 per 1,000 last year, against 140, 145, and 127 in the three preceding years. In London the rate was 113 per 1,000, while in the seventy-five other large towns, and ranged from 62 in Hornsey, 77 in Leyton, 81 in Hastings, 83 in Bournemouth, 85 in King's Norton, and 87 in Handsworth (Staffs) to 156 in Wigan, 158 in Middlesbrough, 159 in Oldham, 163 in Salford, and 167 in Warrington and in Rochdale, 178 in Merthyr Tydfil, 184 in Rhondda, and 200 in Burnley.

The causes of 2,324, or 0.9 per cent., of the deaths in the seventy-six towns last year were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Croydon, East Ham, Walthamstow, Southampton, Ipswich, Great Yarmouth, Plymouth, Devonport, and Derby; the highest proportions of uncertified deaths were 3.3 in St. Helens, in Preston, and in Barrow-in-Furness, 3.5 in Bootle, 3.6 in King's Norton, 3.8 in Birmingham, 4.3 in Warrington, 4.6 in South Shields, and 5.4 in Gateshead.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 7,507 births and 6,705 deaths were registered during the week ending Saturday last, March 6th. The annual rate of mortality in these towns, which had been 17.5, 18.1, and 19.1 per 1,000 in the three preceding weeks, further rose last week to 21.3 per 1,000. The rate of mortality ranged from 8.7 in Hornsey, 10.1 in Reading, 10.4 in Handsworth (Staffs), 10.5 in Walsall, 11.5 in Walthamstow, and 12.1 in Tottenham, and in Leyton, to 27.5 in Frinton, 28.0 in Rhondda, 28.7 in Stockport, 29.1 in Rochdale, 29.5 in Hanley, 29.9 in Wigan, and in Bury, and 35.6 in St. Helens. In London the rate of mortality was 22.8 per 1,000, while it averaged 20.8 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 2.0 per 1,000 in the seventy-six towns: in London this death-rate was equal to 2.0 per 1,000, while among the seventy-five other large towns these diseases caused deaths ranging upwards to 5.1 in Birmingham, 5.3 in Bury, 7.2 in West Hartlepool, 8.6 in Aston Manor, 8.7 in Warrington, and 13.2 in St. Helens. Measles caused a death-rate of 2.5 in Sheffield, 3.9 in Birmingham, 4.4 in Sunderland, 5.3 in West Hartlepool, 7.2 in Warrington, 7.3 in Aston Manor, and 8.8 in St. Helens; scarlet fever of 1.6 in St. Helens; diphtheria of 1.0 in Stockport and 1.3 in King's Norton; whooping-cough of 1.1 in Swansea, 1.2 in Aston Manor, 1.3 in South Shields, 1.7 in Wigan, and 2.7 in St. Helens; and diarrhoea of 2.0 in Great Yarmouth. The mortality from enteric fever showed no marked excess in any of the large towns, and no fatal case of small-pox was registered during the week. The number of scarlet fever patients remaining under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital at the end of the week was 2,875, against 3,002, 2,910, and 2,825 at the end of the three preceding weeks; 285 new cases were admitted during the week against 289, 273, and 292 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

During the week ending Saturday last, March 6th, 935 births and 738 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 18.2, 19.8, and 22.0 per 1,000 in the three preceding weeks, rose to 23.0 per 1,000 in the 1,000 last week, but was 0.6 per 1,000 below the mean rate during the same period in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 8.8 in Perth and 15.0 in Greenock to 25.0 in Paisley and 27.4 in Dundee. The death-rate from the principal infectious diseases averaged 2.5 per 1,000 in these towns; the highest rates being recorded in Glasgow and Aberdeen. The 357 deaths registered in Glasgow included 3 from scarlet fever, 4 from diphtheria, 40 from whooping-cough, and 3 from enteric fever, and 25.7 per 1,000 from cerebro-spinal meningitis. Six fatal cases of whooping-cough were recorded in Edinburgh; 10 of whooping-cough and 2 of enteric fever in Aberdeen; and 3 of whooping-cough in Paisley, and 2 in Leith.

HEALTH OF IRISH TOWNS.

During the week ending Saturday, February 27th, 631 births and 503 deaths were registered in the twenty-two principal urban districts of Ireland, as against 562 births and 470 deaths in the preceding period. The annual death-rate in these districts, which had been 20.7, 20.4, and 21.5 per 1,000 in the three preceding weeks, rose to 23.0 per 1,000 in the week under notice, this figure being 3.9 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 24.3 and 21.0 respectively, those in other districts ranging from 10.3 in Portlarn and 11.4 in Newtownards, to 30.8 in Clonmel and 31.0 in Lurgan, while Cork stood at 23.3, Londonderry at 23.0, Limerick at 24.6, and Waterford at 25.5. The zymotic death-rates in the twenty-two districts averaged 1.0 per 1,000, as against 1.1 per 1,000 in the preceding week.

During the week ending March 6th, 594 births and 492 deaths were registered in the twenty-two principal urban districts of Ireland, as against 631 births and 503 deaths in the preceding period. The annual death-rate in these districts, which had been 20.4, 21.5, and 23.0 per 1,000 in the three preceding weeks, fell to 22.5 per 1,000 in the week under notice, this figure being 1.2 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 25.6 and 21.6 respectively, those in other districts ranging from 4.2 in Newry and 4.8 in Ballymena to 37.4 in Wexford and 41.2 in Armagh, while Cork stood at 24.0, Londonderry at 20.5, Limerick at 22.5, and Waterford at 23.4. The zymotic death-rate in the twenty-two districts averaged 1.3 per 1,000, as against 1.0 per 1,000 in the preceding period.

ANNUAL MEETING, BRITISH MEDICAL ASSOCIATION, BELFAST, 1909.

The Seventy-seventh Annual Meeting of the British Medical Association will be held at Belfast from July 23rd, to July 31st, 1909, under the Presidency of Sir William Whitla.

The Annual Representative Meeting commences in Belfast on July 23rd. The Presidential Address will be delivered on July 27th. The Sections will meet on July 28th, 29th, and 30th.

A preliminary programme of arrangements was published in the SUPPLEMENT, February 27th, 1909. The Honorary Local Secretaries are: Henry Lawrence McKisack, M.D., M.R.C.P., 17, University Square, Belfast; Cecil Edward Shaw, M.A., M.D., M.Ch., 29, University Square, Belfast and Howard Stevenson, B.A., M.B., F.R.C.S.I., 2, College Square North, Belfast.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

The British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the BRITISH MEDICAL JOURNAL is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent by the Branch Secretary to the General Secretary of the Association, and to every

Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signature as laid down in By-law 5.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the BRITISH MEDICAL JOURNAL for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BORDER COUNTIES BRANCH.

THE autumn general meeting of this Branch took place in the County Hotel, Carlisle, on Friday, October 30th, 1908. In the unavoidable absence of the President, Dr. Macdonald, the chair was taken by the VICE-PRESIDENT, Dr. J. E. Bowser of Penrith, and there were about twenty members present.

Confirmation of Minutes.—The minutes of the previous meeting were read, approved, and signed.

New Member.—The CHAIRMAN intimated that Dr. A. D. McCallum of Abbey Town had been elected a member of the Association.

Papers, etc.—Dr. J. B. BIRD read a short paper on "The Treatment of Cases by Intragastric Electrization," giving his experience in 3 such cases, and a summary of the experiences of other workers in this field. Dr. HILL showed the "button electrode" which was used in these cases, as well as the ordinary stomach tube which he had converted for the same purpose in those cases where there was difficulty in swallowing the button. Dr. W. S. SYMS read a detailed and interesting paper on "Aural Vertigo," and dealt with the different conditions in which vertigo was a prominent symptom. He entered largely into the question of differential diagnosis, and concluded with some remarks on the correct operative treatment and his own personal experiences. In the absence of Dr. RODERICK MACLAREN, his paper on "Fracture of the Base of the Skull" was read by Mr. NORMAN MACLAREN, and aroused considerable discussion among the members. Mr. NORMAN MACLAREN then showed a series of pathological specimens, and another series of interesting specimens belonging to Dr. G. R. LIVINGSTON was also submitted to the meeting by the SECRETARY, as Dr. Livingston had been unfortunately prevented from attending, which included interesting specimens from cases of unusual complications attending appendicitis.

CAMBRIDGE AND HUNTINGDON BRANCH.

A MEETING of this Branch was held on Friday, March 5th, at 2.15 p.m., at the Medical Schools, Downing Street, Cambridge, Mr. L. NEWTON, President, in the chair. There were twenty-nine members present.

Confirmation of Minutes.—The minutes of the last annual meeting were read and confirmed.

New Members.—Mr. Robert McCheyne Linnell, B.A., M.R.C.S., L.R.C.P., Cambridge, and Mr. Anson Robertson Jordan, B.A., M.B., B.C., Great Shelford, Cambridgeshire, were elected members of the Branch.

The Branch and the Cambridge Medical Society.—The working arrangements between the Branch and the Cambridge Medical Society, as proposed by the joint committee of the two societies, were approved.

Whole-time Medical Officers.—The report of the Public Health Committee of the Association on the desirability of health officers being compelled to give their whole time to the work, was then considered. Professor SIMS WOODHEAD (President-elect) proposed:

That medical officers of health be debarred from engaging in private practice.

Dr. LATHAM seconded. The PRESIDENT proposed an amendment:

That medical officers of health should only be debarred from private practice in large towns.

Dr. HALLETT seconded. The amendment was carried.

Paper.—Dr. ARTHUR LATHAM, Physician to St. George's Hospital, then read a paper on "Some Recent Advances in the Diagnosis and Treatment of Tuberculous Affections. A discussion followed, in which several members took part.

Vote of Thanks.—A vote of thanks to Dr. Latham was proposed by Professor HOWARD MARSH and seconded by Dr. STEAR. Sir CLIFFORD ALLBUTT spoke in support. This was carried unanimously.

GIBRALTAR BRANCH.

THE annual meeting was held on March 5th, instead of the 3rd, as originally intended. Fourteen members were present.

Annual Report.—The annual report was read and approved.

Election of Officers.—The following were elected office-bearers for the present year: President, Colonel Murray, P.M.O. Vice-President, Deputy Inspector-General F. J. Lilly, R.N.; Honorary Secretary and Treasurer, L. D. Parsons, Port Surgeon; Members of Council, Drs. Abrines,

Oman, Lyons, Major Fowler, R.A.M.C., and Major Keble, R.A.M.C.

Dinner.—The members with two guests dined together after the meeting.

LANCASHIRE AND CHESHIRE BRANCH:

MANCHESTER (SOUTH) DIVISION.

An ordinary general meeting of the Division was held at the house of Dr. E. Vipont Brown, 2, Birch Lane, Longsight, at 3.45 p.m., on Friday, March 5th; Dr. McDougall in the chair. There were nine members present: Drs. Vipont Brown, Carnwath, Cotterill, Edlin, Gregory, Russen Rhodes, Stocks, and Wild.

Apologies for Non-attendance.—Regrets for absence were received from Drs. Hopkinson and Grant Davie, for whom Dr. Carnwath kindly officiated as Honorary Secretary.

Confirmation of Minutes.—The minutes of the last meeting were read and signed.

Medical Inspection and Treatment of School Children.—A letter was read from the Honorary Secretaries of the Joint Committee of the Manchester and Salford Divisions, submitting for consideration the resolutions adopted by that committee on this subject. After some discussion, it was proposed by Dr. Vipont Brown, and seconded by Dr. Cotterill:

That where the resolutions of the Joint Committee differ from those previously adopted by this Division, the resolutions of the Division be adhered to.

This was adopted *nem. con.*

The Medical Profession as a Career.—A copy of a letter on the medical profession as a career, sent by the Joint Committee to the heads of schools in Manchester and district, was submitted and taken as read.

Proposed Recommendation to Joint Committee.—The following recommendation was approved *nem. con.*:

That the Joint Committee be instructed to take such steps as they may deem proper to secure recognition by the public authorities of the Joint Committee as the representative body of the profession in Manchester.

Whole-time Medical Officers of Health.—The memorandum from the Public Health Committee on this subject was considered, and after a brief discussion it was unanimously agreed:

That in all future appointments medical officers of health should be debarred from engaging in private practice.

Letter from the Science Committee.—A communication was read on the subject of scientific work of Divisions and Branches, and it was resolved:

That this Division approves of the idea of converting the Central Library of the Association into a lending library.

At this stage Dr. McDougall was called away, and Dr. Russen Rhodes was moved to the chair.

Medical Certification of Suitability of Patients for Hospital Treatment.—In discussing this subject Dr. Wild pointed out that even if the resolution were passed in its present form and carried into practice it would not offer sufficient guarantee against hospital abuse. Few general practitioners, he affirmed, would have the courage, or indeed could afford, to refuse certificates to that class of patient by whom the advantages offered by hospitals were most abused. It would merely have the effect of throwing on the general practitioner extra work for which he would not be paid. He finally proposed, and it was agreed unanimously, that the words "is desirable wherever practicable" be substituted for "be required," and that the words "except in case of casualties" be omitted. The resolution thus read:

That a medical certificate of suitability for hospital treatment is desirable wherever practicable as a condition of hospital treatment.

The meeting was then adjourned, the other subjects on the agenda being referred, it being understood that an early date for their discussion would be arranged.

METROPOLITAN COUNTIES BRANCH:

EALING DIVISION.

A MEETING of this Division was held on Wednesday, March 3rd, at 8.45 p.m., Dr. Ruck in the chair. The severe weather interfered with the attendance, and the matters referred from head quarters could not be satisfactorily dealt with.

Chronic Ulceration of the Rectum.—Mr. D'ARCY POWER, Surgeon to, and Lecturer on Surgery at, St. Bartholomew's Hospital, read a paper on Some Cases of Chronic Ulceration of the Rectum. Mr. Power stated that he had recently had several cases of the kind under his care, and that the condition merited greater attention than appeared to have been given to it. He read an account of his own recent cases, and then classified chronic ulceration of the rectum into four great groups—namely: (1) Ulcerative colitis, (2) syphilitic ulceration of the rectum, (3) tuberculous, (4) carcinomatous. The first group (ulcerative colitis) he further subdivided into: (a) Dysenteric, (b) syphilitic, (c) tuberculous, (d) secondary to pelvic cellulitis. The second group (syphilitic ulceration of the rectum) can be further subdivided into: (a) Gummatous, (b) anal and rectal syphiloma. Mr. Power laid considerable stress on the part played by infective colitis in producing inflammation of the rectum; it was usual to speak of chronic ulceration of the rectum as "malignant" or "syphilitic," but the more correct attitude was to regard ulcerative colitis (a direct infective condition) as the exciting cause, and syphilis, tubercle, or injury as the predisposing causes. On the one hand, these inflammatory conditions would in all probability have subsided if the patient had not become infected with the micro-organism leading to ulcerative colitis; on the other hand, if the tissues had been perfectly sound, it was probable that the infective agent would never have effected a lodgement. Mr. D'Arcy Power next drew attention to the differential diagnosis of the various forms of chronic ulceration of the rectum, and then dealt with the treatment. He preferred medical means and local applications, but urged a resort to surgery if relief was not attained within a reasonably short time, lest the inflammation be allowed to become incurable.

SOUTH-EASTERN BRANCH:

GUILDFORD AND WINCHESTER DIVISIONS.

A joint clinical meeting of these Divisions was held at the Royal Surrey County Hospital on Wednesday, March 10th, at 3 p.m., under the presidency of Dr. P. DUNDAS MINCHIN, Chairman of the Guildford Division.

Papers.—Colonel FIRTH, R.A.M.C., read an interesting and suggestive paper entitled "Some Reflections on the Theory of Heredity," in which he pleaded for greater accuracy and more care in collecting and recording evidence bearing on the problem of heredity in disease, and appealed to those present, as well as to members of the profession generally, to each assist in some way in the elucidation of the subject. A short discussion followed, in which Drs. BRISCOE and SMYTH took part.

Discussion.—Dr. A. M. MITCHELL opened a discussion on the importance of early operation in appendicitis, to which Drs. GODWIN, PARKER, BODINGTON, BEVAN, and SHEAF also contributed.

Cases.—Dr. SHEAF read notes of two cases of enlarged thyroid, and showed portions of the gland which he had removed. The patients were also exhibited.

Demonstration.—Dr. GAUVAIN gave an interesting demonstration of the method of treatment of spinal caries as carried out at the Cripples' Home, Alton, and illustrated his remarks by means of a model.

Cases and Specimens.—The following were shown: (1) Mr. E. J. SMYTH: Congenital dislocation of lenses. (2) Mr. H. J. FARDON (for Dr. BRODRICK): Pseudo-hypertrophic paralysis. (3) Dr. J. F. BRISCOE: Specimens from five cases of morbus cordis in the insane.

Votes of Thanks.—Tea was served at the close of the meeting, and votes of thanks were accorded to the readers of papers, etc., and to the Committee of the hospital for the use of the board-room and for kindly providing tea.

SOUTH-EASTERN OF IRELAND BRANCH.

The first meeting of this Branch for the session 1909 was held at the Club House, Carlow, on Wednesday, March 3rd, at 5.30 p.m.

In the absence of the President, Dr. G. J. MACKESY was voted to the chair. The other members present were Drs. C. E. James, E. J. Farmer, J. V. Ryan, J. W. H. Jelllett, E. McDonald, and R. B. Carey, Acting Secretary.

Confirmation of Minutes.—The minutes of the last meeting were read, confirmed, and signed.

Apologies for Non-attendance.—Apologies for absence were read from Drs. Murphy (President), O'Brien, and Currie.

Remuneration for Lectures on Public Health, etc.—The resolution from the Fermanagh Branch of the Irish Medical Association *re* adequate remuneration for lectures on all subjects concerning public health and disease, etc., was very fully discussed in all its aspects, and spoken to by each member present. It was proposed by Dr. JELLETT, and seconded by Dr. JAMES:

That we approve and adopt the resolution of the Fermanagh Branch of the Irish Medical Association *re* adequate remuneration for lectures on all subjects concerning Public Health and Disease, and it is the opinion of this meeting that no member of this Branch should act in such capacity without adequate remuneration.

Carried *nem. con.*

Well-to-do Patients and Hospitals.—The resolution of the Branch *re* the admission of well-to-do patients into union hospitals, which had been forwarded through the Irish Committee with a view to legislation, and sent back to the Branch by the Irish Committee for amendment, was then considered. The ACTING HONORARY SECRETARY having explained that the Irish Committee considered the latter part of the last sentence of the resolution as involving a condition which could not be carried out without leading to a great deal of friction, it was proposed by Dr. JAMES, and seconded by Dr. RYAN:

That this meeting accepts the amendment to the resolution proposed by the Irish Committee, and requests them to forward it as amended with a view to legislation.

Carried with one dissentient.

The Draft Charter and the Referendum.—The resolution from the South-Western Branch *re* method of taking the Referendum was next discussed, and their resolution and the facts set forth by that Branch bearing on the question having been read, it was proposed by Dr. FARMER and seconded by Dr. RYAN:

That we, the members of the South-Eastern (Ireland) Branch of the British Medical Association, are of opinion that it is necessary for the safe government of the Association that a Referendum should be taken on the requisition of half the Council, and then by letter addressed to every member of the Association.

Carried *nem. con.*

Fees for Examination under Employers' Liability and Workmen's Compensation Acts.—A discussion arose on the subject of fees for examination and reports under the Employers' Liability and Workmen's Compensation Acts, and a notice of motion for next meeting was given in by Dr. MACKESY.

Payment for Branch Dinners.—Notice of motion was handed in by Dr. Laffan for the next meeting on the subject of mode of payment for dinners at Branch meetings. There being no further business the meeting was adjourned.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EAST ANGLIAN BRANCH.—The spring meeting will be held at Bury St. Edmunds on Thursday, April 15th. Members wishing to read papers or show cases should communicate at once with Dr. Gutch, Ipswich, the Honorary Secretary for Suffolk.—B. H. NICHOLSON, Senior Secretary, East Lodge, Colchester.

LANCASHIRE AND CHESHIRE BRANCH.—*Change of date of Branch Council meeting.* Owing to April 14th falling in Easter week the Branch Council meeting will be held a week earlier, namely, on Wednesday, April 7th. 4.30 p.m., at Onward Buildings, 207, Deansgate, Manchester.—F. CHARLES LARKIN, Honorary Secretary, Liverpool.

LANCASHIRE AND CHESHIRE BRANCH: ALTRINCHAM DIVISION.—A general meeting will be held at the Greenbank Hotel, Northwich, at 5 p.m., on Wednesday, April 21st, to receive reports from the Executive Committee, to consider matters referred to Divisions, and to transact the usual business. At

6 p.m. Dr. Manwaring White will read a paper on Frontal Sinusitis as a Complication of Influenza. Dinner at 7 p.m.—T. W. H. GARSTANG, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.—In response to the kind invitation of the House Committee and medical staff of the London Hospital, a meeting of this Division will be held at the London Hospital on Friday, March 26th, at 4 o'clock. Visitors will be shown the Finsen light department, Dr. Tynnaer's new radiant heat baths, the operating theatres, and the lady almshouses and the methods used for checking hospital abuse in out-patients. Dr. Leonard Hill will give a demonstration on the use of oxygen, Dr. Bulloch a bacteriological demonstration, and the staff will give demonstrations of cases in the wards. It will facilitate arrangements if those members of the Division who expect to be present will inform the Honorary Secretary, H. BECKETT-OVERY.

OXFORD AND READING BRANCH: OXFORD DIVISION.—The next general meeting of this Division will be held on Friday, March 26th, at the Radcliffe Infirmary, Oxford, at 3 p.m. Agenda: (1) Dr. Collier will propose the following resolution: "That in view of the practical experience of the last thirty-seven years, during which period the Association has enjoyed great financial prosperity it has been proved that in the best interests of the British Medical Association it is essential to have an official with the rank and status of 'General Secretary and Manager,' and that such official should possess special business training. Further, that having regard to the highly satisfactory manner in which Mr. Guy Elliston has discharged the duties since his appointment in 1902, it is in the interests of the Association that his services should be retained as General Secretary and Manager; and that the Representative of the Oxford Division to the Representative Meeting at Belfast be instructed accordingly." (2) Certain business matters referred to the Divisions will be laid before the meeting by the Secretary. (3) Specimens and cases will be shown. (4) Dr. Robert Hutchison will open a discussion on a subject connected with dietetics.—W. DUIGAN, Honorary Secretary.

SOUTH-EASTERN BRANCH: BROMLEY DIVISION.—The next meeting of the Bromley Division will be held at the Bell Hotel, Bromley, on Friday, March 26th, at 4 p.m., Dr. Scott in the chair. Agenda:—(1) Minutes of last meeting. (2) To decide when and where the next meeting will be held. (3) Communications from the Medical Secretary of the Association regarding: (a) Science Committee and Library; (b) Midwives Act; (c) Report on Medical Certification of Patients for Hospital Treatment (vide SUPPLEMENT to the BRITISH MEDICAL JOURNAL, February 27th); (d) Report on Contributions to Hospitals by Employers of Labour and Employees (vide SUPPLEMENT to the BRITISH MEDICAL JOURNAL, February 27th); (e) Statement as to sanitary public medical institutions; (f) Statement as to sanitary for workers suffering from tuberculosis (Leaflets V and VI enclosed). (4) Letter from Mrs. Seldon. (5) The following paper has been promised by J. Blumfeld, M.D.: The Avoidance of Danger during Anaesthesia, and the bearing upon this of some Recently Introduced Apparatus. All members of the Division are requested to attend, and to invite those of the profession in their own district who are not members of the Association to be present.—A. TENNYSON-SMITH, Honorary Secretary, Orpington.

SOUTH-EASTERN OF IRELAND BRANCH.—A meeting of this Branch, also a meeting of the Branch Council and the local Division, will be held at Adelphi Hotel, Waterford, on Wednesday, April 7th, at 3.15 p.m. Agenda: (1) Minutes of last meeting. (2) Letters of apology. (3) Correspondence. (4) Dr. Laffan will move that dinners at Branch meetings be paid for at so much to each member present and half of that amount to each absent member. (5) Dr. Mackesy will move that members of this Branch bind themselves not to accept a less fee than one guinea for examination and report in any case under the Employers' Liability Act or Workmen's Compensation Act at common law, whether same be furnished on behalf of employers or insurance companies. (6) Any other business.—J. QUIRKE, Honorary Secretary, Piltown.

SOUTH MIDLAND BRANCH: BUCKINGHAMSHIRE DIVISION.—The first meeting of the Buckinghamshire Division will be held on Tuesday, March 30th, at the Royal Bucks Hotel, Aylesbury, at 5.30 p.m.—A. E. LARKING.

WEST SOMERSET BRANCH.—The next meeting of this Branch will be held at the Taunton and Somerset Hospital on Friday, April 2nd, at 3.30 p.m., when the President, Dr. H. T. S. Aveline, will take the chair. It is hoped to make this largely a clinical meeting, and members are invited to submit cases and specimens of interest. The following are already promised:—Mr. A. J. H. Iles: Skiagrams showing the utility of X Rays in the Diagnosis of Diseases of Bone. Mr. A. E. Joscelyne: A Case of "Port Wine" Mark treated with High-frequency Currents. Hospital Treatment: The members of the Branch will be asked to instruct their Representative how he shall vote on the following resolution, which will be brought before the next Representative Meeting: "That a medical certificate of suitability for hospital treatment be required as a condition of hospital treatment, except in the case of casualties." Further par-

ticulars on this subject will be found in the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of February 27th, 1909. "What is an Accident?" Should time permit, Dr. Aveline will open a discussion on this subject, which, owing to the Workmen's Compensation and other recent Acts of Parliament, has become of interest and importance. Tea will be served at the conclusion of the meeting.—W. B. WINCKWORTH, Honorary Secretary, Taunton.

British Medical Association.

GRANTS AND SCHOLARSHIPS FOR SCIENTIFIC RESEARCH.

GRANTS.

THE Council of the British Medical Association is prepared to receive applications from members of the Medical Profession for Grants in aid of Researches for the Advancement of Medicine and the Allied Sciences.

The Grants are made subject to the following conditions:

1. That the work of the Grantee shall be subject to inspection by the Science Committee of the Association.
2. That each Grantee shall furnish to the Science Committee, on or before May 15th following the allotment of the grant, a report (or, if the object of the grant be not then attained, an interim report, to be renewed not later than the same date in each subsequent year until the final report is presented) containing:

(a) A statement, in a form satisfactory to the Science Committee, of the results arrived at, or the stage which the inquiry has reached;

(b) A statement of expenditure incurred, accompanied by vouchers as far as possible;

(c) A reference to any Transactions, Journals, or other publications in which the results of the research have been announced.

SCHOLARSHIPS.

THE Council of the British Medical Association is also prepared to receive applications for Research Scholarships, as follows:

1. An ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.

2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research in Anatomy, Physiology, Pathology, Bacteriology, State Medicine, Clinical Medicine, or Clinical Surgery.

Each Scholarship is tenable for one year, but is renewable by the Council, provided that the whole period of tenure shall not exceed three years.

The Scholarships are awarded subject to the following conditions:

1. That the work of the Scholar shall be subject to inspection by the Science Committee of the Association.

2. That he shall furnish the Science Committee, on or before May 15th following the grant of the Scholarship, with a statement of the work done by him.

3. That he sign an undertaking to abide by the above and other regulations affecting Scholarships, a copy of which will be supplied to him.

Applications.

Applications for Grants and Scholarships for the year 1909-10 must be made, not later than May 27th, 1909, in the prescribed form, a copy of which will be supplied on application to the Medical Secretary, 429, Strand, London, W.C.

Each application should be accompanied by a recommendation from the head of the laboratory in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

J. SMITH WHITAKER, *Medical Secretary.*

429, Strand, W.C.,
March, 1909.

Hospitals and Asylums.

CRICHTON ROYAL INSTITUTION, DUMFRIES.

THE annual report for the year 1908 of the Board of Directors of this large asylum contains the first report of Dr. C. C. Easterbrook as physician-superintendent. Considerable structural alterations and additions have been in progress since 1906, including extended accommodation for parochial patients, and the plans previously adopted have, we learn from the report of the board, been largely and advantageously modified under the advice of Dr. Easterbrook, so that, when completed, the improved structure will permit of proper classification of patients. Also verandahs have been added for open-air treatment, and the establishment of a special department for psychological investigation is being considered, and the board expect that by the end of the present year this department will have organized and the work begun. On January 1st, 1908, there were on the registers 831 certificated patients and 21 voluntary boarders, and on the last day of the year there were 828 certificated patients and 32 voluntary boarders. Considering here only the certificated patients, the total cases under treatment during the year numbered 985, and the average number daily resident 327.7. During the year 154 cases, or 151 persons, were admitted. Of these 129 were first admissions, and in 112 the patients were suffering from their first attack. Dr. Easterbrook's table showing the duration of mental disorder refers only to the first admissions or "receptions," and shows that in 83 the disorder was recent or acute—that is, under six months' duration on admission; in 28 subacute or subacute—that is, from six months to two years in duration—and in 18 chronic, or of more than two years' duration. The 129 first admissions were classified according to the forms of mental disorder into: Mania, 37; melancholia, 28; delusional and hallucinatory insanity, 27; volitional, impulsive, and moral insanity, 5; insanity with epilepsy, 5; general paralysis, 5; confusional insanity, 5; stupor and katatonia, 3; primary dementia, 2; secondary dementia, 2; insanity with gross brain lesion, 1; and cases of congenital or infantile defect, 6. No separate table is furnished setting forth the supposed etiological factors in the admissions, but the causation of insanity is discussed in general terms in Dr. Easterbrook's report, in the course of which it is stated that only 4 suffered from mental disease attributable to alcohol or drugs. The small proportion of general paralytics admitted—3.8 per cent.—is striking. During the year 61 patients were discharged as recovered, giving a recovery rate on the admissions of 39.6 per cent.; 39 as improved, and 4 as not improved. During the year also 53 died, giving a death-rate on the average numbers resident of only 6.4 per cent. The deaths were due in 25 cases to cerebro-spinal diseases, including 9 deaths from general paralysis, in 10 to diseases of the heart and blood vessels, in 1 to bronchitis, in 4 to abdominal diseases, and the remaining 13 to general diseases, including 5 deaths from tuberculosis. The deaths from tuberculosis thus formed less than 10 per cent. of the total deaths. All deaths, with the exception of one case—that of a patient who threw himself from a window and received fatal injuries—were from natural causes; and, apart from a few sporadic cases of influenza and one case of erysipelas, the institution was free from zymotic disease.

BIRMINGHAM GENERAL DISPENSARY.

THE 115th annual report of the Birmingham General Dispensary shows that the total number of patients admitted during the year was 58,977, being an increase of 1,933; whilst the total number of patients treated, including accidents, was 74,695. The new branch at Smethwick was opened to patients on September 29th, 1908, and those treated up to December 31st numbered 1,131. The committee have co-operated with the Central Committee of the Birmingham and District Provident Dispensary by agreeing that for a year's trial the prescriptions of the medical officers of the Provident Dispensary shall be dispensed at the various branches of the institution, in consideration of which it would receive 20 per cent. of the subscriptions and entrance fees paid by the members of the Provident Dispensary. The amount received for subscriptions and supernumerary tickets to the General Dispensary was £71 8s. less than in 1907. The expenditure, exclusive of the relief fund, showed an increase of £604 on that of last year.

THE SAMARITAN HOSPITAL FOR WOMEN, LIVERPOOL.

THE annual meeting of this institution was held at the Town Hall on February 25th. The report shows a slight increase of the work done in both in-patient and out-patient departments, in spite of the fact that the work was interfered with for several weeks by the alterations which have been made in the buildings. These—which include the remodelling of the out-patient department, a new operating room, new anaesthetic room, dressing rooms, and a ward with five additional beds—were now complete and working.

ROYAL ABERDEEN HOSPITAL FOR SICK CHILDREN.

THE thirty-second annual report of this institution states that during the year 1908 2,537 cases were treated—747 as in-patients and 1,790 as out-patients—compared with 2,547 in the previous

year, of whom 770 were in-patients and 1,777 out patients. Of the 747 in-patients, 472 were cured, 60 were improved, 70 died, 76 remained in the wards at December 31st last, and the balance were removed as unfit, etc. The average stay in hospital of each in-patient was 35.32 days; in 1907 it was 35.04. The average number of beds in daily occupation was 72.3 compared with 69.7 in the previous year. In addition, 49 convalescent children were sent to the Eildon Home, Culter, which adjacent continues to be of indispensable aid in the working of the hospital. The ordinary expenditure for the year was £2,888 15s. 3d., being an average annual expenditure per occupied bed of £39 19s. 14d., or an average daily expenditure per patient of 2s. 2d. The ordinary income amounted to £1,892 8s. 4d., or £996 6s. 11d. less than the ordinary expenditure for the year. During the year two sums of £600 were received for the permanent endowment of cots.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 8,866 births and 6,972 deaths were registered during the week ending Saturday last, March 13th. The annual rate of mortality in these towns, which had been 18.1, 19.1, and 21.3 per 1,000 in the three preceding weeks, further rose last week to 22.1 per 1,000. The rates in the several towns were as follows: 10.9 in London, 11.1 in Gloucester, 12.9 in East Ham, 12.9 in Hantsworth (Staffs), 12.9 in Grimsby, 13.2 in Devonport, and 13.7 in Willesden, to 26.2 in Liverpool, 26.3 in Bootle and in Salford, 26.6 in Stockport, 27.0 in Birmingham, 29.0 in Bury, 34.6 in Brighton, and 35.1 in St. Helens. In London the rate of mortality was 24.0 per 1,000, while it averaged 21.5 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 2.0 per 1,000 in the seventy-six towns; in London, also, this death-rate was equal to 2.0 per 1,000, while amongst the seventy-five other large towns the rate from these infectious diseases ranged upwards to 4.9 in Birmingham, 5.1 in Sheffield, 5.2 in Sneathwick, 5.5 in Aston Manor, 6.5 in West Hartlepool, 7.2 in Warrington, and 15.9 in St. Helens. Measles caused a death-rate of 3.5 in Sunderland, 3.7 in Sneathwick, 4.0 in Birmingham, 4.7 in Sheffield, 4.9 in Aston Manor, 6.5 in West Hartlepool, 7.2 in Warrington, and 12.6 in St. Helens; scarlet fever of 1.1 in Northampton and 1.5 in Reading, whooping-cough of 1.1 in Birmingham, 1.2 in Wigan, and 1.3 in Preston, 2.0 in Great Yarmouth, 2.5 in Southampton and in Wolverhampton, 2.6 in Bury, and 2.7 in St. Helens; and enteric fever of 1.0 in Middlesbrough. The mortality from diphtheria and from scarlet fever showed a marked excess in the large towns, and no fatal case of small-pox was registered during the week. There were 2 small-pox patients remaining under treatment in the Metropolitan Asylums Hospitals at the end of the week; 2 new cases having been admitted during the week. The number of scarlet fever cases in these hospitals and in the London Fever Hospital, which had been 2,910, 2,825, and 2,873 at the end of the three preceding weeks, had declined again to 2,870 at the end of last week; 285 new cases were admitted during the week, against 273, 232, and 285 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

DURING the week ending Saturday last, March 13th, 973 births and 771 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had been 19.8, 20.0, and 20.7 per 1,000 in the three preceding weeks, further rose to 21.6 per 1,000 last week, but was 0.5 per 1,000 below the mean rate during the same period in the seventy-six large English towns. Amongst the Scottish towns the death-rates ranged from 15.2 in Leith and 20.4 in Edinburgh to 24.4 in Aberdeen and 27.9 in Perth. The death-rate from the principal infectious diseases averaged 2.7 per 1,000 in these towns, the highest rates being recorded in Glasgow and Aberdeen. The 66 deaths registered in Glasgow included 6 which were referred to diphtheria, 37 to whooping-cough, and 14 to diarrhoea. Six fatal cases of whooping-cough and 2 of diarrhoea were recorded in Edinburgh, 2 of scarlet fever, and 3 of diarrhoea in Dundee; 2 of measles, 2 of diphtheria, 8 of whooping-cough, and 3 of diarrhoea in Aberdeen; and 2 of whooping-cough in Paisley.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, March 13th, 595 births and 524 deaths were registered in the twenty-two principal urban districts of Ireland, as against 594 births and 492 deaths in the preceding period. The annual death-rate in these districts, which had been 21.5, 23.0, and 22.5 per 1,000 in the three preceding weeks, rose to 23.9 per 1,000 in the week under notice, this figure being 1.8 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 27.5 and 20.9 respectively, those in other districts ranging from 6.6 in Queenstown and 9.6 in Ballynary, to 31.7 in Tralee and 53.8 in Dundalk, while Cork and 25.0, Londonderry at 23.2, and Limerick at 26.6 and Waterford at 13.6. The zymotic death-rate in the twenty-two districts averaged 1.3 per 1,000, being the same ratio as in the preceding period.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

THE following appointments have been made at the Admiralty: Fleet Surgeon R. HILL, M.V.O., and Surgeon A. L. ROBINSON, M.B., to the *Dreadnought*, on recommissioning, March 24th; Surgeon T. F. ELWYN, to the *Halcyon*, on recommissioning, April 1st; Fleet Surgeon T. C. MEIKLE, M.B., and Surgeon E. A. G. WILKINSON, to the *King Edward VII.*, on recommissioning, March 27th; Fleet Surgeon F. FEND, M.B., to the *Hibernia*, March 27th; Surgeon W. E. MATTHEW and Surgeon H. STONE, M.B., to the *Berwick* on commissioning, April 1st; Staff Surgeon J. W. CRAIG, M.B., to the *Cochrane*, on recommissioning, April 1st; Staff Surgeon G. E. DUNCAN, to the *Centinel*, April 1st; Surgeon G. W. CRAN, to the *Hibernia*, April 15th; Surgeon J. R. A. CLARE-HALL, to the *Research*, on recommissioning, March 30th.

ARMY MEDICAL SERVICE.

COLONEL L. E. ANDERSON, who is serving in India, is appointed Principal Medical Officer, Allahabad and Fyzabad Brigades. Colonel S. C. R. ROBINSON, also serving in India, is appointed Principal Medical Officer, Jubbulpore and Jhansi Brigades.

ROYAL ARMY MEDICAL CORPS.

Major J. W. BULLIN, M.D., Brigade Laboratory, Madras, is appointed Special Officer in the Prevention of Diseases. Colonel W. A. QUAYLE, M.D., Madras, Principal Medical Officer, Aden Brigade, is granted six months' combined leave out of India (the first sixty days being privilege leave, the remainder leave on private affairs), from April 28th.

INDIAN MEDICAL SERVICE.

COLONEL R. W. S. LYONS, M.D., Bombay, is appointed Principal Medical Officer, Abbottabad and Sialkot Brigades.

SPECIAL RESERVE.

ROYAL ARMY MEDICAL CORPS.

Surgeon-Major E. C. THOMPSON, M.B., from the North of Ireland Imperial Yeomanry, to be a Major of the Special Reserve of Officers, July 7th, 1908. The undermentioned are to be Lieutenants, on probation, of the Special Reserve of Officers, dated March 1st, 1909: JAMES N. McLAUGHLIN, ROBERT T. C. ROBERTSON, M.B., JOSEPH G. McCUTCHEON, M.B.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Lowland Mounted Brigade Field Ambulance.—Major R. T. HALLIDAY, M.B., to be Lieutenant-Colonel, January 11th. Captain H. W. THOMSON, M.B., to be Major, January 11th.

South London Brigade.—Major E. LLOYD-WILLIAMS, from the 3rd London Bearer Company, Royal Army Medical Corps (Volunteers), to be Lieutenant-Colonel, with precedence as in the Volunteer Force, April 1st, 1908. Major (Honorary Major in the Army) W. M. O'CONNOR, M.D., from the Royal Army Medical Corps (Militia), to be Major, September 20th, 1908. Captain F. P. MILLER, from the Royal Army Medical Corps (Territorial Force), to be Captain, February 22nd, 1909. Captain J. W. BIRD, from the Royal Army Medical Corps (Territorial Force), to be Captain, February 22nd, 1909. Lieutenant W. BAIN, M.B., from the 2nd London Bearer Company Royal Army Medical Corps (Volunteers), to be Lieutenant, with precedence as in the Volunteer Force, April 1st, 1908.

Third South Midland Field Ambulance.—CYRIL C. LIVINGTON to be Lieutenant, January 15th.

For Attachment to Units other than Medical Units.—Surgeon-Major A. REES, from the Seventh Division Electrical Engineers, Royal Engineer (Volunteers), to be Major, with precedence as in the Volunteer Force, April 1st, 1908. Surgeon-Captain and Honorary Surgeon-Major R. C. M. POOLEY, from the 5th Middlesex (West Middlesex) Volunteer Rifle Corps, to be Captain, with the honorary rank of Surgeon-Major, with precedence as in the Volunteer Force, April 1st, 1908. Captain and Honorary Surgeon-Major R. C. M. POOLEY to be Major, April 2nd, 1908. Major C. AVERILL, M.D., to be Lieutenant-Colonel, May 19th, 1908. Lieutenant R. B. BRIDGEMAN to be Captain, February 1st, 1909. Captain JAMES MALPAS to be Major, February 25th, 1909.

YEOMANRY.

Surgeon-Major H. BRAMWELL, M.D., Gloucestershire (Royal Gloucestershire Hussars), is granted the honorary rank of Surgeon-Lieutenant-Colonel, March 31st, 1908.

INFANTRY.

Surgeon-Major H. T. TAYLOR, M.B., 4th Battalion the Duke of Edinburgh's (Wiltshire Regiment), is granted the honorary rank of Surgeon-Lieutenant-Colonel, March 31st, 1908.

CHANGES OF STATIONS.

THE following changes of stations amongst the officers of the Army Medical Service have been officially reported to have taken place during February:

	FROM	TO
Surgeon-General H. R. Whitehead, F.R.C.S. Eng.	Cherat	S. Command.
Colonel D. O'Sullivan, F.R.C.S.I.	Mhow	Bareilly.
" M. W. Korin	Tidworth	Irish Comd.

ANNUAL MEETING, BRITISH MEDICAL ASSOCIATION, BELFAST, 1909.

THE Seventy-seventh Annual Meeting of the British Medical Association will be held at Belfast from July 23rd, to July 31st, 1909, under the Presidency of Sir William Whitla.

The Annual Representative Meeting commences in Belfast on July 23rd. The Presidential Address will be delivered on July 27th. The Sections will meet on July 28th, 29th, and 30th.

A preliminary programme of arrangements was published in the SUPPLEMENT, February 27th, 1909. The Honorary Local Secretaries are: Henry Lawrence McKisack, M.D., M.R.C.P., 17, University Square, Belfast; Cecil Edward Shaw, M.A., M.D., M.Ch., 29, University Square, Belfast; and Howard Stevenson, B.A., M.B., F.R.C.S.I., 2, College Square North, Belfast.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

THE British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the BRITISH MEDICAL JOURNAL is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent by the Branch Secretary to the General Secretary of the Association, and to every

Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the BRITISH MEDICAL JOURNAL for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

SUPPLEMENT

British Medical Association.

ANNUAL MEETING, BELFAST, 1909.

THE PATHOLOGICAL MUSEUM.

The following Committee has been appointed to organize the pathological museum:

President: Professor W. ST. CLAIR SYMEYS.

Honorary Secretaries: THOMAS HOUSTON, M.D.;
W. J. WILSON, M.D.

J. S. DICKIE, M.B.	C. H. P. D. GRAVES, M.D.
ROWLAND HILL, M.B.	(Cookstown).
C. G. LOWRY, M.D.	Professor McWEENEY (Dublin).
J. E. MACLWAIN, M.D.	Professor MOORE (Cork).
JOHN McLEISH, M.B.	C. H. NESBITT, M.D. (Randallstown).
W. J. MAGUIRE, M.D.	Professor O'SULLIVAN (Dublin).
J. C. RANKIN, M.D.	R. T. ROWLETTE, M.D. (Dublin).
FRED. SMYTH, M.D.	Professor WHITE (Dublin).
ERNEST WALES, M.D.	JOHN WILSON, M.D. (Castleblaney).
J. SINGLETON DARLING, M.D. (Lurgan).	

EX-OFFICIO MEMBERS.

The President-elect: Sir WILLIAM WHITLA, M.D., LL.D.

The Local Honorary Treasurer: JOSEPH NELSON, M.D.

The Local Honorary Secretaries: H. L. McKISACK, M.D.; C. E. SHAW, M.D.; HOWARD STEVENSON, F.R.C.S.I.

The Committee propose that the material should be arranged under the following heads:

- I. Exhibits bearing on discussions and papers in the various sections.
- II. Specimens and illustrations relating to any research work.
- III. Instruments relating to clinical diagnosis and pathological investigation.
- IV. Individual specimens of special interest, or a series illustrating some special subject.

It is also proposed to make a special effort to gather together a series of exhibits relating to:

- (a) Tuberculosis.
- (b) Diseases of warm climates.
- (c) Cancer of the uterus.
- (d) X-rays and photography.

The Committee wish it to be understood that the above are only suggestions, and if there is any subject in which Members are specially interested, and of which interesting specimens can be supplied, they will be glad to hear from them

The Museum will occupy a central position, and will be easy of access.

It is hoped that it will be possible for arrangements to be made whereby exhibitors may have an opportunity of demonstrating their specimens.

THOMAS HOUSTON,
W. J. WILSON,
Honorary Secretaries.

Communications should be addressed to one of the Honorary Secretaries at Queen's University, Belfast.

GRANTS AND SCHOLARSHIPS FOR SCIENTIFIC RESEARCH.

GRANTS.

The Council of the British Medical Association is prepared to receive applications from members of the Medical Profession for Grants in aid of Researches for the Advancement of Medicine and the Allied Sciences.

The Grants are made subject to the following conditions:

1. That the work of the Grantee shall be subject to inspection by the Science Committee of the Association.
2. That each Grantee shall furnish to the Science Committee, on or before May 15th following the allotment of the grant, a report (or, if the object of the grant be not then attained, an interim report, to be renewed not later than the same date in each subsequent year until the final report is presented) containing:

- (a) A statement, in a form satisfactory to the Science Committee, of the results arrived at, or the stage which the inquiry has reached;
- (b) A statement of expenditure incurred, accompanied by vouchers as far as possible;
- (c) A reference to any Transactions, Journals, or other publications in which the results of the research have been announced.

SCHOLARSHIPS.

The Council of the British Medical Association is also prepared to receive applications for Research Scholarships, as follows:

1. An ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.
2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research in Anatomy, Physiology, Pathology, Bacteriology, State Medicine, Clinical Medicine, or Clinical Surgery.

Each Scholarship is tenable for one year, but is renewable by the Council, provided that the whole period of tenure shall not exceed three years.

The Scholarships are awarded subject to the following conditions:

1. That the work of the Scholar shall be subject to inspection by the Science Committee of the Association.
2. That he shall furnish the Science Committee, on or before May 15th following the grant of the Scholarship, with a statement of the work done by him.
3. That he sign an undertaking to abide by the above and other regulations affecting Scholarships, a copy of which will be supplied to him.

Applications.

Applications for Grants and Scholarships for the year 1909-10 must be made, not later than May 27th, 1909, in the prescribed form, a copy of which will be supplied on application to the Medical Secretary, 429, Strand, London, W.C.

Each application should be accompanied by a recommendation from the head of the laboratory in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

J. SMITH WHITAKER, *Medical Secretary.*

429, Strand, W.C.,
March, 1909.

Meetings of Branches & Divisions.

[The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BIRMINGHAM BRANCH.

An ordinary meeting was held at the Medical Institute on Thursday, March 11th, Mr. F. MARSH, the President, being in the chair, and 20 members present.

Annual Report.—The report of the Branch to the Central Council on the membership and financial position of the Branch, and on its proceedings during the year 1908, was considered and approved.

Demonstration.—Mr. GEORGE HEATON showed a patient in whom a liver abscess had burst through the right lung, leaving a fistula through which large quantities of bile were coughed up. The man was a painter aged 25. His illness started with pain in the left hypochondrium and left side of the abdomen, with fever and general malaise. This continued for seven weeks. A rigor then followed, and pain in the right side of the chest and abdomen. Ten days afterwards he was suddenly seized with suffocating dyspnoea, and coughed up large quantities of grumous pus. He then brought up daily bile-stained pus, and finally large quantities of pure bile mixed with frothy pus. A diagnosis of liver abscess bursting into a large bronchus, and opening also one of the larger bile ducts, was made. Under local cocaine anaesthesia a rib was excised, and the hepatic abscess drained through the diaphragm. The expectoration of bile, which had been as much as 35 fl. oz. a day, at once ceased, and he gradually made a complete recovery. Mr. Heaton called attention to the extreme rarity of a biliary fistula through the lung, and discussed the probable causes of the original liver abscess.

Papers.—Dr. W. A. POTTS read a paper on the origin of the feeble-minded, which was discussed by Dr. MANN, Dr. AGAR, Dr. BELCHER, and Dr. HENTON-WHITE. Dr. POTTS replied. Mr. J. FURNEAUX JORDAN read a paper on certain cases of haemorrhage from the uterus. This was discussed by the President, Dr. SHALLWOOD SAVAGE, Mr. WHITEHOUSE, and Dr. LYDALL. Mr. J. FURNEAUX JORDAN replied.

CENTRAL DIVISION.

A SPECIAL and a general meeting of this Division was held at the Medical Institute on March 16th at 3.30 p.m. Mr. GAMGEE was in the chair, and there were twenty-five other members present.

Special Meeting.

Earlier Election of Representative.—The CHAIRMAN, having declared the meeting special, moved the alterations of the rules necessary to enable the Division to elect the Representative earlier than is at present possible:

1. In Rule 7, after "three months" to "nine months."
2. In Rule 11, "Business of Annual Meeting," omit Section (b).

These alterations were unanimously agreed to.

Vote of Thanks to Former Representative.—A letter from Dr. FOXCROFT, tendering his resignation as Representative, was read, and it was resolved:

That this meeting of the Division accepts Dr. Foxcroft's resignation with regret, and tenders to him its best thanks for his past services as Representative.

Election of Representative.—The SECRETARIES announced that the Executive had nominated Dr. KIRBY as Representative, and, no further nominations being made by the meeting, he was pronounced duly elected. This concluded the special business.

General Meeting.

Confirmation of Minutes.—The minutes of the last ordinary general meeting were read, confirmed, and signed.

Report of Representative.—Dr. KIRBY then moved the resolution standing in his name:

That the Representative shall submit his report to the first general meeting of the Division held after the Annual Representative Meeting.

This was seconded and carried unanimously. The following additional resolution was also carried:

That the Executive Committee be instructed to bring this resolution before the next special meeting of the Division as a proposed addition to the Rules of the Division.

Medical Inspection of School Children.—On the Medico-Political Committee's report on the medical inspection of school children and the treatment of those found defective considerable discussion arose. To the questions submitted to the Division the following answers were finally adopted:

Question 1.

That in the opinion of this Division medical inspectors giving their whole time to the duties should be paid by salary; those only giving part time should be remunerated according to the time spent on the work.

Question 2.

Resolution 1.—That this Division emphatically disapproves of the treatment of school children in school clinics, as it considers that the available medical and surgical skill is fully adequate to meet all reasonable requirements.

Resolution 2.—This Division considers that, should school clinics be established, the staff should consist of all medical practitioners in the neighbourhood who are willing to serve, and that they should be paid according to the time spent on the work.

Question 3.

As this question only applies to rural districts it was not considered.

Question 4.

That this Division looks to the Education Authority to devise efficient means to ensure that parents, who can afford to pay for the treatment of their children when found defective as the result of the medical inspection of school children, should be compelled to do so.

Whole-time Medical Officers.—To the question submitted, "That medical officers of health should be debarred from engaging in private practice," the Division gave the answer—

That this is desirable wherever practicable.

Certificates of Suitability for Hospital Treatment.—The recommendation "That a medical certificate of suitability for hospital treatment be required as a condition of hospital treatment, except in case of casualties," was unanimously agreed to, and the Division "strongly disapproved" of the two motions referred on the "contributions to hospitals by employers of labour and employees."

Fresh Public Medical Institutions.—The motion on the subject of fresh public medical institutions was unanimously approved.

GLOUCESTERSHIRE BRANCH.

A GENERAL meeting of the Branch was held at the Cheltenham Hospital, on March 18th, at 7 p.m., the PRESIDENT in the chair, and twenty-two members present.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Cases.—Dr. S. M. HEBELTHWAITE showed a case of achondroplasia, which was discussed by the PRESIDENT, and MESSRS. BRAMWELL, CARDEW, PRUEN, CUTHBERT and COLLINS. Mr. ARTHUR CARDEW showed a dermoid cyst of the broad ligament, which was discussed by the PRESIDENT, and MESSRS. CUTHBERT, HOWELL, COOKE, and BRAMWELL.

Paper.—Dr. C. BRAINE-HARTNELL read a paper on the early diagnosis and treatment of some forms of pelvic obstruction. A discussion followed in which the PRESIDENT, and MESSRS. CARDEW, BRAMWELL, and PRUEN took part.

Dinner.—Fifteen members afterwards sat down to dinner at the Cosy Corner.

LANCASHIRE AND CHESHIRE BRANCH:

BURY AND ROCHDALE DIVISIONS.

A JOINT meeting of these two Divisions was held on March 17th in the Navigation Hotel, Heywood, Dr. HITCHON, Chairman of the Rochdale Division, presiding. There were present Drs. Hitchon, Melvin, Kerr, Walker, Geddes and Brown, of the Rochdale Division, and Drs. J. B. Kerr, Greenhalgh, and Turnbull, of the Bury Division.

Confirmation of Minutes.—The minutes of the last two joint meetings were read and approved.

The Work of the Central Council.—Dr. GARSTANG, of Altrincham gave an interesting address on the work of the Central Council. A vote of thanks, moved by Dr. BROWN and seconded by Dr. J. B. KERR, was passed unanimously.

Grouping of Divisions.—It was agreed that the Bury and Rochdale Divisions should be grouped together for the purposes of representation at the annual meeting. Dr. BROWN, of Bacup, and Dr. Greenhalgh, of Bury, were elected Representative and Deputy Representative respectively.

Assistant Medical Officer of Health to Bury.—The SECRETARY of the Bury Division read a letter from the Secretary of the Branch Council (Mr. Larkin), inquiring as to the cause of failure to obtain the minimum salary in the case of the recent appointment. The Secretary was instructed to reply that the failure was in some measure due to the opposition of the Chairman of the Health Committee, who is a member of the British Medical Association, and that the joint meeting, while disapproving of his action, requests the Branch Council to deal with the matter as it deems expedient. The Secretary was also instructed to write to the new assistant medical officer of health explaining his position in relation to the recognized policy of the Association.

Medical Certification of Suitability of Hospital Patients.—The Representative was instructed to support the recommendation of the Council.

Contributions to Hospitals through Insurance Companies.—No definite pronouncement was made.

Fresh Public Medical Institutions.—The recommendation of the Council was agreed to.

METROPOLITAN COUNTIES BRANCH:

LAMBETH DIVISION.

A GENERAL meeting of this Division was held in the Evelina Hospital on Thursday, March 18th, at 4 p.m.; Dr. ATKINSON was in the chair.

Confirmation of Minutes.—The minutes of the previous meeting were read and confirmed.

Medical Officers of Health.—A communication from the Public Health Committee re whole-time medical officers of health was received, and, after considerable discussion and proposed amendments, the following resolution, proposed by Dr. DENNING and seconded by Dr. HERBERT TAYLOR, was carried *nem. con.*:

That the Lambeth Division of the British Medical Association considers that medical officers of health should not be debarred from engaging in private practice in the case of small towns and country districts.

Paper.—The CHAIRMAN then called upon Mr. GOADBY to read his paper upon Illnesses Influenced by Oral Sepsis. An interesting discussion followed, and a very practical point which arose out of it in regard to treatment was to

the effect that in the case of septic stumps in the mouth it was highly dangerous to have more than quite a few of them removed at a time. Mr. Goadby quoted several cases in which the extraction of 7, 8, or more such septic stumps had led to so increased an auto-infection that the patient had succumbed within a short time afterwards from pyæmia, purpura hæmorrhagica, and other most unfortunate complications. There were many other points of interest in the paper, but they were too many to summarize briefly in minutes.

Coroners and the Medical Profession.—The CHAIRMAN drew the attention of the meeting to the fact that each member of the Division had received a communication from the Medico-Political Committee re coroners and the medical profession, and requested members individually to interest themselves in the matter, and send any information they might have at their disposal either to the Medical Secretary, Dr. Smith Whitaker, or the Secretary of the Lambeth Division, Dr. Herbert French.

Suitability of Patients for Hospital Treatment.—It was proposed by Dr. FRENCH, seconded by Dr. TAYLOR, and carried unanimously:

That the Lambeth Division considers that a medical certificate of suitability for hospital treatment should be required as a condition of hospital treatment, except in the case of casualties.

Fresh Public Medical Institutions.—It was proposed by Dr. DENNING, seconded by Dr. TAYLOR, and carried unanimously:

That the Lambeth Division considers that it is desirable that no fresh public medical institution should be opened without previous consultation with the local medical profession through some organized body, such as the Division of the British Medical Association, in the area of which it is proposed to establish such new institution, and that it be an instruction to the Council to give effect to this principle in considering applications from Divisions or Branches for support in dealing with hospital questions.

Memorandum from the Branch Council.—Attention was called by the CHAIRMAN to the draft memorandum on the proposed Federated Societies' Medical Benefit Association by the Council of the Metropolitan Counties Branch of the British Medical Association, and members were urged to do all in their power to dissuade members of the profession from lending any support to a scheme so injurious to the real interests of the community.

Votes of Thanks.—Hearty votes of thanks both to Mr. Goadby for his paper and to the governors and Secretary of the Evelina Hospital for the kind arrangements that had been made for the holding of the meeting there, were proposed from the chair and carried unanimously, and the meeting adjourned at 5.40 p.m.

STRATFORD DIVISION.

A MEETING was held on Thursday, March 18th, at the Alexandra Hotel, Stratford, E., Dr. SPURRELL presiding, in the unavoidable absence of the Chairman.

An Address.—Mr. E. E. HENDERSON gave an address on the diagnosis and treatment of some inflammatory affections of the eye, and, after discussion, was awarded a very hearty vote of thanks.

Memorandum from the Branch Council.—The draft memorandum on the proposed Federated Societies' Medical Benefit Association by the Council of the Metropolitan Counties Branch of the British Medical Association was then considered, but, after full discussion, no decision was come to in the matter.

SOUTHERN BRANCH:

GUERNSEY AND ALDERNEY DIVISION.

A MEETING was held on Friday, March 12th, Dr. E. L. ROBINSON, President, in the chair. There were also present Major Myles, R.A.M.C. (President-elect), and Drs. Aikman, Bishop, Brehaut, Conrad Carey, Carruthers, Collings, de Jersey, and Bulteel (Honorary Secretary).

Apologies for Non-attendance.—Apologies were received from Dr. Bisson, Colonels Mosse and Robinson, and Dr. Wallace.

Confirmation of Minutes.—The minutes of the last meeting, held on February 1st, were read and confirmed.

Lunacy Laws.—There were produced by the Secretary the English Lunacy Act of 1890, the Guernsey Lunacy Ordinance of 1903, a letter from Dr. Manning, of Salisbury,

and a letter from the Medical Secretary of the Association, enclosing copies of the protective clauses in the English Act, and the report of the Association's special commissioner on the subject in 1906. It was resolved that a committee of five members, Drs. Benson, Bulteel, Corbin, de Jersey, and Robinson, be appointed to go into the whole question and report subsequently to the Division their recommendations, and that they be empowered to continue in office, if necessary, beyond the next annual meeting and until their labours are completed.

Divisional Library.—Communications were read from the Science Committee through the Medical Secretary. Drs. Aitken, Bulteel, and Carruthers were appointed a Library Committee, and instructed to draft rules for management of the library, and to submit a list of recommended purchases, according to the available funds, out of lists suggested by members.

Earlier Appointment of Representatives.—The communication hereon from the Organization Committee having been read, notice was given by the SECRETARY that he would confer with the Jersey Division, which was part of this constituency, with a view to each Division submitting an amended rule of similar nature at the annual meeting of both Divisions.

Whole-time Medical Officers of Health.—A memorandum from the Public Health Committee on this subject was read, and it was resolved that, in this Division's opinion, medical officers of health should be debarred from engaging in private practice, where possible.

Midwives Act.—It was resolved that, as the Midwives Act is not in force in Guernsey, this Division feels unable to express any opinion thereon.

Medical Certification for Hospital Treatment.—On the question of medical certificates being considered a necessary condition of hospital treatment, except in Poor Law cases, it was resolved that it be an instruction to the Representative to reply in the affirmative.

Contributions to Hospitals by Employers and Employees.—So many and grave difficulties were apprehended in this report that it was found impossible to come to any decision.

Fresh Public Medical Institutions.—The statement of the Hospitals Committee herein was read, and their proposition against such institutions being opened without previous consultation with the local medical profession. It was ordered that the reply be in the affirmative.

Medical References to Sanatoriums.—The reference from the Representative Meeting of the undesirability of local practitioners holding, or continuing to hold, appointments as honorary local medical referees to the National Association for the Establishment and Maintenance of Sanatoriums for Workers suffering from Tuberculosis was read. It was resolved that this Division assents thereto.

School and Compensation Certificates.—No certificates from hospitals with a view to compensation are issued here, as the Workmen's Compensation Act does not apply. No certificates are issued for fitness or unfitness for school except on order of the Board of Education (generally for ringworm), and for which a fee of 2s. 6d. is paid.

YORKSHIRE BRANCH.

A MEETING of this Branch was held at the Royal Eye and Ear Hospital, Bradford, on Wednesday, March 10th, Dr. R. TURNER (York), President, in the chair.

Adoption of Minutes.—Dr. BRONNER (Honorary Secretary) read the minutes of the last meeting, which were adopted.

The Referendum.—Dr. SINCLEAR WHITE (Sheffield) proposed and Dr. MOSSOR (Bradford) seconded that the President and Secretary should be empowered to sign a petition to the Privy Council, asking for an amendment in the Charter to the clauses relating to the Referendum. This was adopted *nem. con.*

The Report for the Year.—The annual reports and financial statements of the Branch and its constituent Divisions for the past year were presented.

New Members.—The following were elected to the membership of the Association: Ernest Woodhead Blackburn, M.B., Ivy House, Barnsley; James Grahame Campbell, M.D., Brantwood, Rotherham; Henry J. Clarke, jun., M.B., 53, Hall Gate, Doncaster; George O. Gauld, M.B., Elvington, York;

William Bertram Hill, M.D., The Mount, Harrogate; James Blacklay Lockerbie, M.B., The Cliffe, Otley Road, Bradford; Thos. Stephen MacSwiney, M.B., Monk Bretton, Barnsley; James K. W. Morris, M.B., Treeton, Sheffield; Matthew Bertram Potts, M.B., Dean House, West Vale, Halifax; William J. Burns Solkirk, M.B., Children's Hospital, Bradford; Annie Florence Theobalds, M.B., Poor Law Hospital, Halifax; Arthur Henry Thomas, M.B., Boroughbridge, Yorks; Robert McLeod Veitch, M.D., The Esplanade, Harrogate.

Papers.—Dr. CAMPBELL (Bradford) read a paper entitled "Some Remarks on Graves's Disease." Dr. Campbell pointed out that whilst myxoedema was a comparatively rare disease in the West Riding of Yorkshire, in fact not more often met with than might be accounted for by importation and by the occasional passage of exophthalmic goitre into myxoedema, yet Graves's disease was exceedingly common. He further remarked that in addition to true Graves's disease there were a very large number of cases of slight enlargement of the thyroid gland associated with anaemia. He suggested that there might possibly be some direct relationship between the frequency of the occurrence and the almost universal use of upland surface water, poor in calcium salts, in the district. With this view, he stated that for the last ten years he had consistently treated all his cases of Graves's disease with lime salts and had attained better results with this method, associated with rest, etc., than he had observed in any other form of treatment. He discussed the theories of causation, enumerated the principal symptoms, and described the chief methods of treatment that had been employed, laying special stress upon the advisability of giving abundant nourishment, but of avoiding excessive quantities of milk or other food substances which tended to stimulate the thyroid gland to increased activity. In dealing with surgical procedures he pointed out that ligation of the thyroid arteries was a more rational and less dangerous form of treatment than partial removal of the gland. He concluded by saying that, in his opinion, allowing for the fact that exophthalmic goitre was so often seen in degenerates who, of course, retain their degenerate characteristics independently of the cure or amelioration of the disease, the prognosis given was often unnecessarily hopeless and the treatment that of inactivity which was the reverse of mastery. Dr. BRONNER thanked Dr. Campbell for his excellent paper, and drew attention to the fact that in a recently-issued textbook on ophthalmology, 300 pages were devoted to this subject. He considered that the disease was due to a toxic condition. To his mind, some of the most interesting symptoms were those produced in the cornea. In some cases a keratitis was produced, with a degeneration of the centre of the cornea, inducing sloughing and the ultimate destruction of the cornea. Dr. GILMOUR (Burley) remarked that mental symptoms were by no means uncommon, and in Scalebor Park Asylum there were at present 3 or 4 cases with mental derangement. He had recently been treating cases of this character by giving milk from goats which had had the thyroid gland previously removed. Each goat gave about 2½ pints of milk daily. He had found the emaciation reduced, but the other symptoms had not been very markedly improved. Dr. BLACK (Harrogate) spoke strongly in favour of the treatment of Graves's disease by rest. He had in mind especially one patient whom he had kept in bed for nearly a year, and treated by 3 or 4 minim doses of tincture of aconite. At the end of the year the patient was much better, and now was nearly quite well again. Dr. J. J. BELL (Bradford) having asked a question as to why Dr. Campbell prohibited the use of milk, Dr. CAMPBELL replied that he thought milk and meat juice stimulated the activity of the gland, and should rather be avoided. Dr. EURICH (Bradford) read a paper on an unusual rare and fatal form of skin disease. The condition was a remarkable one, and the disease appeared to be an unusual form of lupus erythematosus. The case was discussed by Drs. BLACK, BAINTON (Ilkley), and HEAPY (Bradford); and Dr. EURICH replied. Dr. TREVELYAN (Leeds) gave a most interesting address, illustrated by lantern slides, on an analysis of 56 cases of total facial palsy: 9 occurred before 10 years, 7 between 10 and 20, 25 between 20 and 40, and 12 after 40 years. Males and females were equally affected, namely, 28 of each. In 4 cases, two or three preceding attacks had occurred. In all cases, the onset took place in the night, and in 5 others pain or dis-

comfort in the face was noted at the commencement. In 3 bilateral cases 1 was accompanied by paralysis in the arms (? post-influenzal) and in the other 2 by bulbar symptoms. In 1 case, in a boy aged 8 years, the palsy was congenital and was looked upon as a persistent birth palsy. In 2 cases the sixth nerve was also affected. In 1 case of eighteen years' standing with no recovery of voluntary power, a reaction to direct and indirect faradism together with emotional movement persisted in the muscles about the angle of the mouth. In several cases the above-named muscles were seen to be the last to recover. In some cases with preserved faradic reaction rapid recovery in four to six weeks was noted. In 1 case recovery commenced well after twelve months from the onset. Dr. BRONNER (Bradford) showed by lantern slides the method for the direct examination of the oesophagus and upper air passages by Brunner's instruments. At the close of his address Dr. Bronner demonstrated with the actual instruments the methods for their employment. The demonstration elicited the greatest interest on the part of the members, and Dr. Bronner was heartily thanked for the great trouble he had gone to in the matter. The meeting then terminated.

Dinner.—Seventeen members dined at the Midland Hotel.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

COUNCIL MEETING.

A MEETING of the Council will be held at 2 o'clock in the afternoon of Wednesday, April 28th, in the new Council Room, at 429, Strand, London, W.C.

By Order.

March 25th, 1909.

GUY ELLISTON.

BRANCH AND DIVISION MEETINGS TO BE HELD

DORSET AND WEST HANTS BRANCH.—The spring meeting of this Branch will be held in Dorchester on Wednesday, May 5th. Members wishing to read papers, show cases, exhibit specimens, or propose new members, are requested to communicate, not later than Thursday, April 22nd with JAMES DAVISON, Honorary Secretary, "Streteplace," Bournemouth.

DORSET AND WEST HANTS BRANCH AND WEST SOMERSET BRANCH.—Nominations for the office of a Representative on the Central Council should be sent, on or before Tuesday, April 13th next, in accordance with By-law 25, to JAMES DAVISON, "Streteplace," Bath Road, Bournemouth.

EAST ANGLIAN BRANCH.—The spring meeting will be held at Bury St. Edmunds on Thursday, April 15th. Members wishing to read papers or show cases should communicate at once with Dr. Gutch, Ipswich, the Honorary Secretary for Suffolk.—B. H. NICHOLSON, Senior Secretary, East Lodge, Colchester.

LANCASHIRE AND CHESHIRE BRANCH.—Change of date of Branch Council meeting. Owing to April 14th falling in Easter week the Branch Council meeting will be held a week earlier—namely, on Wednesday, April 7th, 4.30 p.m., at Onward Buildings, 207, Deansgate, Manchester.—F. CHARLES LARKIN, Honorary Secretary, Liverpool.

LANCASHIRE AND CHESHIRE BRANCH: ALTRINCHAM DIVISION.—A general meeting will be held at the Greenbank Hotel, Northwich, at 5 p.m., on Wednesday, April 21st, to receive reports from the Executive Committee, to consider matters referred to Divisions, and to transact the usual business. At 6 p.m. Dr. Manwaring White will read a paper on Frontal Sinusitis as a Complication of Influenza. Dinner at 7 p.m.—T. W. H. GARSTANG, Honorary Secretary.

NORTH OF ENGLAND BRANCH: NORTH NORTHUMBRIA DIVISION.—A meeting will be held in the Blue Bell Hotel, Belford, on Wednesday, March 31st, at 2.30 p.m. Business: (1) Confirmation of minutes. (2) A discussion on the question of Treatment of School Children under the Education Act will be opened by Dr. Burrow, Medical Inspector of School Children, and members are requested to show their interest in this

important subject by attending and expressing their opinion. For the convenience of those taking part in the discussion reference to the SUPPLEMENT of the BRITISH MEDICAL JOURNAL of June 20th and July 18th, 1908, will be of assistance. (3) Any other business.—C. CLARK BURMAN, Honorary Secretary, Alnwick.

SOUTH-EASTERN OF IRELAND BRANCH.—A meeting of this Branch, also a meeting of the Branch Council and the local Division, will be held at Adelphi Hotel, Waterford, on Wednesday, April 7th, at 5.15 p.m. Agenda: (1) Minutes of last meeting. (2) Letters of apology. (3) Correspondence. (4) Dr. Laffan will move that dinners at Branch meetings be paid for at so much to each member present and half of that amount to each absent member. (5) Dr. Mackey will move that members of this Branch bind themselves not to accept a less fee than one guinea for examination and report in any case under the Employers' Liability Act or Workmen's Compensation Act at common law, whether same be furnished on behalf of employers or insurance companies. (6) Any other business.—J. QUIRKE, Honorary Secretary, Filtown.

SOUTH MIDLAND BRANCH: RUCKINGHAMSHIRE DIVISION.—The first meeting of this Division will be held at the Royal Bucks Hospital, Aylesbury, on Tuesday, March 30th, at 3.30 p.m. Order of business will be as follows: (1) Adoption of Rules.—It is suggested that the whole of the rules sent out be passed *en bloc*. They have been carefully gone over by the Committee and adapted to suit the Division. (2) Election of officers. (3) Resolutions proposed by the Committee: (a) That three of the meetings be held at Aylesbury and one at some other place within the Division. (b) That at each Aylesbury meeting refreshments be provided, and that a fund be formed to meet the expenses. (c) That an annual dinner be held about the month of October. (d) That the Executive Committee be also the Ethical Committee. (4) Medical Inspection of School Children: (a) Paper by Dr. Carruthers. (b) Resolution by Dr. Shaw in reference to fees offered by the Bucks County Council for certificates in infectious cases. (c) Voting on the questions asked at the end of the Memorandum. (5) Demonstration by Dr. William Hill (St. Mary's Hospital) on Direct Vision Laryngoscopy, Tracheo-bronchoscopy, and Oesophagoscopy on Living Patients under Cocaine Anaesthesia. All members of the Division are heartily invited to bring any medical friend with them.—ARTHUR E. LARKING.

WEST SOMERSET BRANCH.—The next meeting of this Branch will be held at the Taunton and Somerset Hospital on Friday, April 2nd, at 3.30 p.m., when the President, Dr. H. T. S. Aveline, will take the chair. It is hoped to make this largely a clinical meeting, and members are invited to submit cases and specimens of interest. The following are already promised:—Mr. A. J. H. Iles: Skiagrams showing the utility of X Rays in the Diagnosis of Diseases of Bone. Mr. A. E. Joscelyne: A Case of "Port Wine" Mark treated with High-frequency Currents. Hospital Treatment: The members of the Branch will be asked to instruct their Representative how to shall vote on the following resolution, which will be brought before the next Representative Meeting: "That a medical certificate of suitability for hospital treatment be required as a condition of hospital treatment, except in the case of casualties." Further particulars on this subject will be found in the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of February 27th, 1909. "What is an Accident?" Should time permit, Dr. Aveline will open a discussion on this subject, which, owing to the Workmen's Compensation and other recent Acts of Parliament, has become of interest and importance. Tea will be served at the conclusion of the meeting.—W. B. WINCKWORTH, Honorary Secretary, Taunton.

CENTRAL MIDWIVES BOARD.

A MEETING of the Central Midwives Board was held at Caxton House, Westminster, on March 18th, with Dr. F. H. CHAMPNEYS in the chair.

Registration of Births.

A letter was received from the Registrar-General as to the Board's request for the addition of a new column to the birth register for the registrars to add the name, status, and address of the person who delivered the child. In this letter the Registrar-General said that these particulars, although no doubt useful, were not among the most desirable additions that could be made; it appeared to the Registrar-General that this information might be inserted in the notice of birth furnished to the medical officers of health in places where the Notification of Births Act had been adopted.

Practitioners "Covering" Midwives.

Letters from Dr. A. G. R. Foulerton, County Medical Officer for East Sussex, as to medical practitioners "covering" midwives, were considered. The Board decided that the Secretary be instructed to draft a case for the opinion of the Privy Council as to whether a certified

midwife personally delivering a woman in childbirth is acting as a midwife where a medical practitioner has been engaged to attend the case.

Midwives in Essex.

A report was considered from Dr. J. C. Thresh, County Medical Officer for Essex, to the Essex Education Committee on the supply of midwives in that county. The Board directed that Dr. Thresh be thanked for the presentation of his report.

Naval and Military Appointments.

ROYAL NAVY MEDICAL SERVICE.

The following appointments have been made at the Admiralty: Fleet Surgeon W. BERT and Staff Surgeon G. C. C. ROSS, M.B., to the *Sutley*, March 15th; Fleet Surgeon H. X. BROWNIE to the *Leviathan*, March 15th; Surgeon F. E. JOLLY to the *President*, additional for three months' course at West London Hospital, March 16th; Surgeon M. HAYDON to be lent to the *Thames* during the absence of Staff Surgeon PEARCE, March 17th; Fleet Surgeon A. J. PICKTHORN to the *Triumph*, March 18th; Fleet Surgeon H. S. R. SPANROW to the *Sapphire*, additional for the *Sapphire II*, April 10th; Fleet Surgeon E. CORCORAN to the Royal Marine Division, Plymouth, April 10th.

INDIAN MEDICAL SERVICE.

The following officers are admitted to the Indian Medical Service, their commissions to bear date August 1st, 1908: R. B. LLOYD, A. C. MCNEIRO, A. G. HENDERSON, G. G. JOLLY, H. STOUT, A. C. MCNEILL, R. L. GAZLEY, F. G. GRAHAM, T. D. MURISON, J. J. H. NELSON, S. S. PRINSON, F. F. S. SMITH, A. J. SYMES, G. S. LITTLE, T. C. BOYD.

TERRITORIAL FORCE.

ROYAL FIELD ARTILLERY.

SURGEON-LIEUTENANT-COLONEL AND HONORARY SURGEON-COLONEL ISAAC MORRIS and Surgeon-Captain J. C. WRIGHT, M.B., from the 2nd West Riding Mosaic, to the 2nd Middlesex Royal Garrison Artillery (Volunteers), are appointed to the 2nd West Riding Brigade, with rank and precedence as in the Volunteer Force, April 1st, 1908 (Surgeon-Captain Wright to be supernumerary).

ROYAL GARRISON ARTILLERY.

Surgeon-Captain J. CHROME, Tyndemouth unit, to be Surgeon-Major, July 17th, 1908. Surgeon-Captains E. N. CLOSE and A. A. MACKETTS, M.B., from the 1st Hampshire Royal Garrison Artillery (Volunteers), are appointed to the Hampshire unit, with rank and precedence as in the Volunteer Force, April 1st, 1908.

ROYAL ARMY MEDICAL CORPS.

For Attachment to Units other than Medical Companies.—Surgeon-Captain R. B. SIDEBOTTOM, from the 6th Battalion the Cheshire Regiment, to be Captain, October 3rd, 1908. He is promoted to be Major, October 4th, 1908. The announcements of the transfer of Surgeon-Captains E. N. CLOSE and A. A. MACKETTS, M.B., from the 1st Hampshire Royal Garrison Artillery (Volunteers), which appeared in the *London Gazette*, October 20th, 1908, are cancelled.

Fourth London General Hospital.—Surgeon-Lieutenant-Colonel and Honorary Surgeon-Colonel (Honorary Captain in the army) ARTHUR THORNE, M.B., from the 2nd Middlesex Royal Garrison Artillery (Volunteers), to be Lieutenant-Colonel with the honorary rank of Surgeon-Colonel, with precedence as in the Volunteer Force, dated April 1st, 1908. (George Nixon Biggs, M.B., to be Major, dated February 26th, 1909.)

Fifth Northern General Hospital.—Major A. V. CLARKE, M.D., from the Mobilization List, Royal Army Medical Corps, Territorial Force, to be Lieutenant-Colonel, February 24th. Captain I. K. HANCOCK, M.B., from the Mobilization List, Royal Army Medical Corps, Territorial Force, to be Major, February 24th.

Sanitary Service (Officers whose services will be available on Mobilization).—Captain L. C. PAGES, M.D., to be Major, March 24th. Captain CLAUDE B. REE, M.B., to be Major, dated April 1st, 1908.

SPECIAL RESERVE.

ROYAL ARMY MEDICAL CORPS.

CAPTAIN C. R. TITCHBORN, from the 1st Royal Army Medical Corps (Militia), having assisted to be transferred, is appointed to the Special Reserve of Officers, retaining the rank and seniority which he held in the Militia, September 20th, 1903.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 8,632 births and 6,985 deaths were registered during the week ending Saturday last, March 20th. The annual rate of mortality in these towns, which had been 21.1, 21.3, and 22.1 per 1,000 in the three preceding weeks, was again 22.1 per 1,000 last week. The rates in the several towns ranged from 10.5 in Walthamstow, 11.9 in Devonport, 12.0 in Hornsey, 12.5 in Wallasey, 12.7 in Gateshead, 13.2 in Barrow-in-Furness, and 13.4 in Burton-on-Trent, to 25.5 in Burnley, 26.0 in Merthyr Tydfil, 26.5 in Wigan, 26.7 in Warrington, 27.5 in Liverpool, 28.2 in Sheffield, and 36.7 in St. Helens. In London the rate of mortality was 24.0 per 1,000, while it averaged 21.5 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 2.3 per 1,000 in the seventy-six towns; this was the rate in London also, while among the seventy-five other large towns the death-rates from these diseases ranged upwards to 4.3 in Portsmouth, 4.6 in Coventry and in West Hartlepool, 4.7 in Birmingham, 4.9 in Blackburn, 5.1 in Warrington, 5.5 in Aston Manor, 6.3 in Wigan, 6.5 in Sunderland, 7.4 in Smethwick, and 17.0 in St. Helens. Measles caused a death-rate of 3.0 in Handsworth (Staffs) and in Sheffield,

3.5 in Wigan, 3.9 in Portsmouth, 4.2 in Birmingham, 4.4 in Smethwick, 4.6 in West Hartlepool, 4.9 in Aston Manor, 5.9 in Sunderland, and 13.2 in St. Helens; scarlet fever of 1.9 in Blackburn and 2.2 in St. Helens; whooping-cough of 1.3 in Coventry, 1.4 in Nottingham, 1.6 in Brighton, 2.0 in Great Yarmouth, and 2.7 in Swansea; enteric fever of 1.4 in Warrington; and diarrhoea of 2.2 in Smethwick. The mortality from diphtheria showed no marked excess in any of the large towns. One fatal case of small-pox belonging to London and 1 to Bristol were registered last week. The Metropolitan Asylums Hospitals contained 3 small-pox patients at the end of last week, against 1 and 2 at the end of the two preceding weeks; 1 new case was admitted during the week, against 2 in the previous week. The number of scarlet fever patients remaining under treatment at the end of the week in these hospitals and the London Fever Hospital was 2,596, against 2,873 and 2,670 at the end of the two preceding weeks; 279 new cases were admitted during the week, against 285 and 268 in the two preceding weeks.

HEALTH OF SCOTTISH TOWNS.

DURING the week ending Saturday last, March 20th, 956 births and 754 deaths were registered in eight of the principal Scottish towns. The annual rate of mortality in these towns, which had risen from 18.2 and 21.6 per 1,000 in the five preceding weeks, declined again last week to 20.1 per 1,000, and was 1.0 per 1,000 below the mean rate during the same period in the twenty-six large English towns. Among these Scottish towns the death-rates ranged from 17.2 in Edinburgh and 17.6 in Perth to 23.7 in Dundee, 23.8 in Paisley, and 25.0 in Greenock. The death-rate from the principal infectious diseases averaged 2.4 per 1,000, the highest rates being recorded in Glasgow and Paisley. The 356 deaths registered in Glasgow in the week which were referred to scarlet fever, 2 to diphtheria, 37 to whooping-cough, 4 to enteric fever, and 8 to diarrhoea. Two fatal cases of scarlet fever and 2 of whooping-cough were recorded in Edinburgh; 2 of diphtheria and 5 of whooping-cough in Dundee; 3 of whooping-cough in Aberdeen; and 2 of scarlet fever and 2 of whooping-cough in Paisley.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, March 20th, 593 births and 571 deaths were registered in the twenty-two principal urban districts of Ireland against 595 births and 524 deaths in the preceding period. The annual death-rate in these districts, which had been 23.0, 22.5, and 23.9 per 1,000 in the three preceding weeks, rose to 26.1 per 1,000 in the week under notice, this figure being 4.0 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 29.3 and 21.0 respectively, those in other districts ranging from 12.3 in Drogheda and 15.9 in Tralee to 46.1 in Queenstown and 46.2 in Clonmel, while Cork stood at 45.5, Limerick at 36.2, and Galway at 17.4. The zymotic death-rate in the twenty-two districts again averaged 1.3 per 1,000, and thus has not varied for the past three weeks.

ANNUAL MEETING, BRITISH MEDICAL ASSOCIATION, BELFAST, 1909.

The Seventy-seventh Annual Meeting of the British Medical Association will be held at Belfast from July 23rd, to July 31st, 1909, under the Presidency of Sir William Whitla.

The Annual Representative Meeting commences in Belfast on July 23rd. The Presidential Address will be delivered on July 27th. The Sections will meet on July 28th, 29th, and 30th.

A preliminary programme of arrangements was published in the SUPPLEMENT, February 27th, 1909. The Honorary Local Secretaries are: Henry Lawrence McKisack, M.D., M.R.C.P., 17, University Square, Belfast; Cecil Edward Shaw, M.A., M.D., M.Ch., 29, University Square, Belfast; and Howard Stevenson, B.A., M.B., F.R.C.S.I., 2, College Square North, Belfast.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

The British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the BRITISH MEDICAL JOURNAL is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent by the Branch Secretary to the General Secretary of the Association, and to every

Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days for such longer period as the Branch may by its Rules prescribe after the date of the said notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the BRITISH MEDICAL JOURNAL for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

Meetings of Branches & Divisions.

The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

EDINBURGH BRANCH: SOUTHERN DIVISION.

A MEETING of this Division was held in the Oddfellows' Hall, Forrest Road, on Friday, March 12th, at 8.15 p.m. Dr. MATHEWSON was in the chair, and there were present Drs. ALLAN, H. JAMIESON, KENNEDY, MOWAT, E. PRICE, PROUDFOOT, SALT, STEWART, WALKER, WEBSTER, and the Secretary.

Apology for Non-attendance.—An apology for absence was intimated from Dr. S. PATERSON.

Confirmation of Minutes.—The minutes of the last meeting were read and (after a correction by Dr. WALKER that a motion was submitted on the report on opposition to the Charter supporting the action of the Branch Council, and that the correction be inserted in the minutes) approved and signed.

Medical Certificates under Workmen's Compensation Act.—Letters were read from the secretaries of the Royal Infirmary and Chalmers Hospital in reply to the question addressed to them re medical certificates under the Workmen's Compensation Act. In both cases the answer was affirmative and satisfactory.

Letter.—A letter was read from Dr. Logan Turner, Secretary of the Branch Council, explaining the delay in bringing the two matters referred to in the minutes before the Branch Council.

Non-members in Area of Division.—The SECRETARY, as requested at the last meeting, placed on the table a list of medical men residing in the Division area who are not members of the Association—52 in number. He was instructed to approach those who might be induced to become members.

Midwives Act.—A letter from the Medical Secretary bearing on the action taken by the Association re the Midwives Act was read. As question (a) is answered in the negative the other questions do not require any answer.

Medical Certification of Suitability for Hospital Treatment.—The report on medical certification of suitability of patients for hospital treatment was considered. The meeting cordially approved of the extract of Poor Law Report, Part V, Chapter 2, paragraph 189, and of the Council's report on the suitability and evidence of suitability of patients for admission. The recommendation,

That a medical certificate of suitability for hospital treatment be required as a condition of hospital treatment, except in case of casualties,

was unanimously approved.

Contributions to Hospitals by Employers and Employees.

—The report on contribution to hospitals by employers of labour and employees was submitted. The negative proposal in (a) motion,

That such contribution should not be considered as entitling the contributors to unlimited hospital, as also to gratuitous medical attendance,

was unanimously approved. The positive proposal in (a) motion,

That the contributions in question should be considered as being the payment of premiums for a proportionate insurance against liability for hospital and medical attendance in cases of serious illness and accidents, which are made on behalf of those unable themselves to pay directly or adequately for the same,

was unanimously disapproved. Motion (b),

That a scheme whereby the contribution should be paid to insurance companies, who in their turn will proportionately recompense hospital boards, hospital staffs, general practitioners, etc., for all attendances given,

was unanimously disapproved.

New Public Medical Institutions.—The statement,

That it is desirable that no fresh public medical institutions should be opened without previous consultation with the local medical profession,

was unanimously agreed to.

Sanatoriums for Tuberculous Workers.—The statement on "Sanatoriums for workers suffering from tuberculosis" was submitted. Dr. WALKER moved that the statement be disapproved. The motion was not seconded. After discussion, joined in by Drs. PRICE, KENNEDY, JAMIESON, and PROUDFOOT, it was agreed with one dissentient to approve statement (a), paragraph 3, statement (b) with the exception of words after "proposed," and statement (c). As regards paragraph 4, there being no members of the profession in the Division area holding appointments as honorary medical referees to the association in question no answer was considered necessary.

Compulsory Notification of Pulmonary Tuberculosis.—Dr. E. PRICE submitted his motion,

That compulsory notification of pulmonary tuberculosis is advisable, so that the enactments of the Public Health Act may be put in force for the benefit of the public,

in an able and interesting paper. Dr. WALKER seconded, Dr. DEWAR moved an amendment:

That while in agreement with notification of pulmonary tuberculosis as being of some benefit to the public welfare, we are of opinion that the infective nature of pulmonary tuberculosis is very much exaggerated, and that persons suffering from this disease can be treated, with proper precautions as regards the sputum and cleanliness, while employed at their work, without much, if any, danger at all to their fellow-workers.

Drs. KENNEDY and STEWART spoke, and Dr. SALT moved the direct negative:

That compulsory notification of pulmonary tuberculosis is not advisable.

Dr. H. JAMIESON, owing to the late hour, moved the adjournment of the debate to Thursday, March 25th, at 8.30 p.m. This was unanimously agreed to.

Adjourned Meeting.

The adjourned meeting of the Division was held in the Oddfellows' Hall, Forrest Road, on Thursday, March 25th, at 8.30 p.m. Dr. MATHEWSON was in the chair, and there were present: Drs. PORTER, DICKSON, PROUDFOOT, SALT, H. JAMIESON, KENNEDY, E. PRICE, WEBSTER, and the Secretary.

Compulsory Notification of Pulmonary Tuberculosis.—Dr. H. JAMIESON seconded Dr. DEWAR's amendment. Dr. PROUDFOOT seconded Dr. SALT's amendment. The discussion was taken part in by Drs. PORTER, WEBSTER, KENNEDY, and MATHEWSON. After replies by Drs. SALT, DEWAR, and PRICE, Dr. DEWAR, with the approval of his seconder, withdrew his amendment in favour of that of Dr. SALT. A vote was taken, when 6 voted for the amendment and 2 for the motion, 2 members declining to vote.

Vote of Thanks.—A vote of thanks to the Chairman closed the meeting.

GLASGOW AND WEST OF SCOTLAND BRANCH:

GLASGOW NORTH-WESTERN DIVISION.

A MEETING of the Division was held in the Burgh Hall, Hillhead, on Wednesday, March 17th, at 8.30 p.m., Dr. JOHN MORTON in the chair, with a very good attendance of members.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Medical Libraries.—In accordance with the instruction from the last meeting, the SECRETARY reported that there were no medical libraries associated with medical societies in the district.

Medical Certificates of Suitability for Hospital Treatment.—The Division was asked to instruct its Representative if a definite pronouncement should be made—

—That a medical certificate of suitability for hospital treatment should be required as a condition for hospital treatment except in the case of casualties.

The matter was debated; and finally it was agreed that while the Division did not approve of this motion, it suggested that managers of hospitals should have their attention drawn to the possibility of checking hospital abuse by the appointment of a scrutineer, who should be a medical man rather than a layman.

Contributions to Hospitals by Employers and Employees.

—The report of the Council on contributions to hospitals by employers of labour and employees was discussed, and the two questions were put as follows:

(i) That the contributions to hospitals by employers of labour and employees by means of weekly collections and otherwise should be considered as being the payment of premiums for a proportionate insurance against liability for medical and hospital attendance, in cases of serious illness and accident, which are made on behalf of those unable themselves to pay directly or adequately for the same, and not as entitling the contributors to unlimited hospital, as also gratuitous medical, attendance as at present seems to be claimed.

(ii) That it be an instruction to the central Hospitals Committee of the Association to endeavour, through the Divisions and otherwise, to obtain acceptance for this principle by the several parties concerned, with a view to elaborating some scheme whereby these contributions should be paid to the rightful parties—namely, insurance companies who in their turn will proportionately recompense hospitals and similar boards, hospital staffs, general practitioners, etc., for all attendances given on illnesses or accidents incurred by those so insured, reporting from time to time to this body.

The meeting unanimously disapproved of both these questions.

New Medical Institutions.—The question of fresh medical institutions was discussed, and the meeting unanimously approved of the following motion:

"That it is desirable that no fresh medical institution should be opened without previous consultation with the local medical profession through some organized body such as the Division of the British Medical Association in the area of which it is proposed to establish such new institution, and that it be an instruction to the Council to give effect to this principle in considering applications from Divisions or Branches for support in dealing with hospital questions.

In the course of the discussion it was intimated that the Corporation of Glasgow was contemplating the establishment of a number of dispensaries throughout the town for the purpose of dealing with tuberculosis; and the secretary was instructed to communicate with the Branch Council drawing its attention to the fact as a matter of some urgency.

National Association for Establishment of Sanatoriums.

—A statement from the Council was read about the National Association for the Establishment and Maintenance of Sanatoria for Workers Suffering from Tuberculosis, and the meeting cordially recognized the principle expressed that all medical referees should be paid for their services.

The Midwives Act.—A statement *re* the Departmental Committee on the working of the Midwives Act was read; but as the Act does not apply to Scotland, the meeting declined to express any opinion on the matter.

The Divisions and the General Practitioner.—Dr.

WHITEHOUSE introduced a discussion on the subject, Do the Divisions of the British Medical Association meet the local requirements of the general practitioner? Dr. WHITEHOUSE answered in the affirmative, and defined the nature of a Division as a local medical society composed of members of the British Medical Association, and the object of the formation of Divisions was to make it as easy as possible for every member to make his voice heard in the government of the Association. The work of such a body presents two aspects:—(a) A local medical society; (b) the part which it takes in the general work of the Association. The benefits to the general practitioner resulting from such work must be regarded in each of these aspects. (a) As a local medical society. This appeals in several aspects: (1) Social and scientific functions: (2) medico-political; (3) ethical. Each of these heads was discussed, prominence being given to the need of each Division trying to grapple with purely local problems—the Division being capable, by its constitution, of being the most powerful society to further the welfare of the profession in every kind of subject affecting its relations with the public. It was shown that the largest amount of self-government prevailed in the Association, as all the work of the Association through whatever agency it might be carried out, was directly or indirectly under the control of the Divisions. Of course, for the carrying out of the central work of the Association it was necessary to have various executive apparatus, such as the Council, Committees, and officials. In addition, however, to this general control the Divisions furnished a most useful agency for arriving at the opinion of the Association on questions of policy; illustrations were given from the work of the Divisions during the past few years of its usefulness in this respect. In the discussion which followed Dr. Whitehouse was heartily thanked for his address. While the meeting as a whole did not homologate all Dr. Whitehouse's opinions, it was agreed that more support and active participation in the work of the Divisions was desirable. Dr. WHITEHOUSE, in replying, read a long and interesting letter from Mr. SMITH WHITAKER, the Medical Secretary, on the subject, and he suggested co-operation with other local medical societies.

LANCASHIRE AND CHESHIRE BRANCH:

SALFORD DIVISION.

A MEETING of the Salford Division was held at the Onward Buildings, Manchester, on March 2nd, Dr. W. C. BROWN, Vice-Chairman, in the chair, to discuss matters referred to the Division. A long discussion took place, and the meeting was adjourned to March 10th, when Dr. O'GRADY (the Chairman of the Division) occupied the chair. At each meeting there was a fair attendance, and the following resolutions were arrived at:

A. *Re* medical officers of health and private practice:

That the present arrangements are on the whole satisfactory by which in counties and large towns the medical officer of health is debarred from private practice, but that such an arrangement is not always possible in rural districts.

B. *Re* medical inspection and treatment of school children:

Inspection.

1. That the Division disapproves of payment per head.
2. That medical inspection should be carried out in towns by whole-time medical inspectors at a salary of not less than £500 per annum for the medical officer and £250 for

assistant medical officers. In other places where necessary part-time medical officers at a salary of £50 per annum for two hours' duty per school week should be appointed.

3. Such appointments should be subject to a reasonable notice and only terminable with the consent of the Board of Education.
4. That no addition ought to be made to the already arduous duties of teachers.

Treatment.

1. Children requiring treatment whose parents can pay for such treatment should be referred to their own medical attendant if possible.
2. That any attempt by public authorities to arrange for the treatment of school children by subsidizing hospitals and other charitable institutions is unsound in principle, and should be condemned.
3. That cases of mental defect and defects of speech should be treated in special schools.
4. That there is no necessity for the establishment of school clinics; first, because children requiring specialized treatment can properly, as at present, be treated at the well-equipped hospitals of the district when the parents are unable to pay for such treatment; and secondly, the Division is of opinion that children not requiring specialized treatment, and whose parents are unable to pay for any general treatment required, ought to be referred to general practitioners, vouchers being given for payment by the education authority. Further, that in view of the suggestion for the establishment of a public medical service on a provident basis contained in the Majority Report of the Royal Commission on the Poor Laws, which suggestion the Division supports, it would be a waste of public money to establish school clinics.
5. That in every district a wage limit should be fixed, and no treatment at the expense of the authorities should be given to the children of parents whose income exceeds the local limit. That the wage limit might well be arranged by consultation between the education authority and the local Division of the British Medical Association, following out the suggestion of the Majority Report of the Poor Law Commission.

METROPOLITAN COUNTIES BRANCH.

Medical Inspection of School Children.

At a meeting held on February 25th the Council of the Metropolitan Counties Branch had under consideration the recent action by the London County Council with respect to the treatment in their own homes of children suffering from suppurating ears (see *BRITISH MEDICAL JOURNAL* of February 13th, p. 426). The Branch Council resolved to address a letter on the subject to the London County Council. The following is a copy of this letter:

[Copy.]

Metropolitan Counties Branch,
British Medical Association,
25th February, 1909.

Sir,—The attention of the Council of the Metropolitan Counties Branch of the British Medical Association having been drawn to the recent decision of the London County Council to issue through the medical inspectors of school children a card notifying to parents arrangements made through the Education Committee for the relief of suppurating ears, the Metropolitan Branch Council desires to press earnestly upon the London County Council the need for alteration of the terms of the card in question since they prescribe one form of treatment irrespective of the actual condition present and without provision for the full instructions of the medical practitioner in charge.

The Metropolitan Branch Council would therefore venture to suggest that for the paragraph detailing certain treatment and beginning "Please syringe" to "acid powder" blank lines be substituted.

In conclusion, the Metropolitan Branch Council desires respectfully to urge that children thus provided by the State with assistance in medical treatment should not be referred to institutions founded and maintained by charity, if not under the care of their own medical attendant, but should receive care under a regular medical service.

We have the honour to remain,

Yours faithfully,

ATWOOD THORNE,
19, Finsbury Street,
E. W. GOODALL.

Eastern Fever Hospital, Homerton,
Honorary Secretaries, Metropolitan Counties
Branch.

To G. L. Gomme, Esq.,
Clerk to the London County Council.

KENSINGTON DIVISION.

Visit to the London Hospital.

A LARGELY attended meeting of this Division was held at the London Hospital on Friday, March 26th, at 3.30 p.m., in response to the invitation of the House Committee and the medical staff. Over sixty members were present.

Mr. HURRY FENWICK, the Chairman of the Medical Council, received the members in the Committee Room of the hospital, and then, aided by members of the medical staff and several of the sisters, conducted the visitors around the hospital. The out-patient department was first visited, and Queen Alexandra's Finsen Light Department was inspected, the cases and the method of using the apparatus being demonstrated by Dr. SEQUERA. The radium treatment was also shown, and the application of x rays for the cure of ringworm of the scalp and various glandular swellings. Dr. MORTON took the visitors through the electro-therapeutic and radiographic departments. The new radiant heat baths, the gift of Princess Hatzfeldt, and lately personally installed in the London Hospital by their inventor, Dr. Tynauer, were next visited. On their way through the department the visitors were shown the lady almoners, and the system for preventing hospital abuse in full work.

A demonstration of a series of medical cases was given by Dr. DAWSON in the medical wards, while in the surgical wards Mr. EVE also showed some cases of interest. Visits were made to the new Pathological Institute erected in memory of the late Sir Andrew Clark, which is under the direction of Dr. H. M. Turnbull, and to the Medical College, where Dr. LEONARD HILL gave a lantern demonstration on blood pressure and the use of oxygen.

At 5 o'clock tea and coffee were served in the Committee Room. Dr. A. J. RICE OXLEY, the Chairman of the Division, proposed that a hearty vote of thanks be given to the House Committee for their kind invitation and hospitality, and to the members of the medical and surgical staff who had gone to such pains and trouble to provide a most interesting series of demonstrations.

Surgeon-General Sir CHARLES CUFFY seconded, and this was carried with acclamation.

WESTMINSTER DIVISION.

A MEETING of this Division, preceded by a dinner, was held on Thursday, March 4th, at 8.30 p.m., at the Criterion Restaurant, W., Dr. WILLIAM EWART, President, in the chair. Twenty were present.

Confirmation of Minutes.—The minutes of the previous meeting were read and confirmed.

Reports.—The following reports were read: (a) Report from Medical Secretary; (b) Reports from Central Ethical Committee. Other reports were allowed to stand over until discussed by the Executive Committee.

Earlier Appointment of Representative in Representative Meetings.—It was proposed, seconded, and carried unanimously—

That this rule be altered to conform to the procedure adopted by other Divisions, namely, that the Representative be appointed not more than one month, and not less than three months prior to the annual meeting.

MR. MANSON'S ADDRESS.

Sir PATRICK MANSON opened a discussion on the "Diagnosis of Fever in Patients from the Tropics," in an address which was published in the *BRITISH MEDICAL JOURNAL* for March 20th, pp. 704-706.

Mr. JAMES CANTLIE said he would take the opposite point of view to that brought forward by Sir Patrick Manson. Sir Patrick had drawn an admirable picture of tropical diseases occurring in British practice which might be mistaken for ordinary ailments; he (Mr. Cantlie) would like to draw attention to diseases which, although apparently ordinary, were really tropical in origin. A series of cases was given in illustration which Mr. Cantlie had met with in practice: (a) An Englishman with a hydrocele of apparently a simple nature presented himself in Hong Kong. The hydrocele was tapped, the fluid drawn into a glass vessel, and the puncture in the scrotum treated in the ordinary way. On looking at the fluid drawn from the hydrocele, it was found to present a milky and rather coagulated appearance. The cause of this was not understood until, on placing a drop of the fluid below the microscope, it was seen to swarm with filaria embryos. The man was infected with *Filaria nocturna*, but except for the

hydrocele he presented no signs or symptoms of infection, yet during the night the peripheral blood was found to be swarming with filaria embryos. It is now a well-known fact that filaria infection may be present, that parent *Filaria bancrofti* may inhabit the body and pour embryos into the blood for many years (Mr. Cantlie had a case recently which had been under his observation for over twenty years) and the patient be in no way inconvenienced. (b) An Englishman presented himself with what appeared to be a "cold" abscess in the forearm. The abscess was opened, and a parent filaria worm presented itself; the peripheral blood of this patient during the night was found swarming with filaria embryos. This fact draws attention to the possibility of abscesses occurring anywhere in the body, be it deep seated in viscera or in the subcutaneous tissues, having as their cause a parent filaria. (c) A Portuguese had retention of urine. The bladder could be made out to extend as high as the umbilicus, yet the passage of a catheter, even a prostatic catheter, fully introduced, failed to bring off urine. After several instruments had been passed, a small quantity of material like ordinary milk curd escaped through the catheter. When the instrument was slowly withdrawn a quantity of the same material escaped by the urethra, followed in a short time by a large quantity—a couple of pints of the curdy material. The retention was due to chyluria; filaria embryos were present in the material passed, and at night filaria embryos were present in the peripheral blood. (d) During the first outbreak of plague in Hong Kong in 1894, Mr. Cantlie was called to a house to see a Parsee. In the house in which the patient lived another Parsee died the day before of plague. The patient he was now called to see had a temperature of 103° F.; his conjunctivae were injected; there was vomiting, a thickly-coated tongue, and a large bubo in the left groin. Plague at once suggested itself, and the patient was removed to the plague hospital. After a few hours he passed urine which suggested chyluria, and at 11 p.m. the same night the embryos of *Filaria nocturna* were found in the blood. The man was suffering from filariasis and not from plague. (e) An Englishman presented himself in London with an eczema intertrigo in the fork. He said he had been treated, but he had found no relief during eight months. On being asked if he lived in England he said he did. The eczema appeared of a type so thoroughly Oriental that the answer was disconcerting; and it was only when he stated that although he lived in England he did not mean he had not been abroad, and that he had acquired his trouble in Hong Kong, the key to diagnosis was complete. The man was suffering from so-called "dhoobie (or washerman's) itch," and an application of sulphur and lime lotion twice daily for three days cured the ailment. Dhoobie itch is a term applied to an eczema of a particular type because it is believed to be contracted by clothing worn by the washerman (native) whilst the garments are in his (the washerman's) hands for laundry purposes. Several other ailments might be mentioned of a type which seems in accord with ordinary diseased conditions met with in British practice, and yet have an etiology quite apart from the everyday ailments we are accustomed to meet with.

Dr. F. M. SANDWITH, after praising Sir P. Manson's paper for its thoroughness and conciseness, thought that the best corollary he could add would be to assume that a European, suffering from a continued fever, had landed in London from a tropical country. It was certain that such a hypothetical patient would believe that his fever was due to some unusual form of malaria, and would already have been indiscriminately dosed with insoluble quinine sulphate. He took this opportunity of reminding members of the bi-hydrochloride and some other salts of quinine. If the fever resisted 10-grain doses of quinine given three times in the mornings of two days, malaria might be dismissed. Enteric, paratyphoid and Mediterranean fever could all be recognized by the serum test, provided the cultures of the last-named were fresh. If examination for all the tropical fevers mentioned in the paper proved negative, he would suggest that the patient was possibly suffering from tuberculosis or from infective endocarditis, both of which had sometimes been found to account for the diagnosis of some obscure cases of fever in and from the tropics.

Dr. SAMBON said Sir Patrick Manson had so admirably outlined the points to be attended to in attempting the diagnosis of fevers in patients returning from the tropics that nothing of any importance could be added to his masterly address. However, having been asked to take part in the discussion, he proposed mentioning a few minor points which might occasionally prove of diagnostic help. Thus, some assistance might be got from a scrutiny of the various places through which the patient had travelled or in which he had resided. Tropical diseases were not all distributed exactly in the same way throughout the tropical zone, but had each their peculiar geographical ranges, and, within these special areas, their own particular stations. Some had a very wide range, and might, like tertian fever, extend far out of the tropics to within a few degrees of the arctic circle; others, like yellow fever, were strictly limited to certain parts of the tropical world, even though, at times, like plague and cholera, they might be carried, by means of shipping, far away from their endemic areas, and for weeks, months, or even years play havoc in regions and places quite unsuited to their permanence. Each tropical region had its own peculiar pathogeny, owing not only to peculiar local diseases but also to the peculiar distribution and prevalence of the diseases it shared with other tropical lands. Therefore the place of former residence might in some measure be suggestive of the disease contracted. Sprue and beri-beri might be expected chiefly from places in Southern Asia, blackwater fever and trypanosomiasis from tropical Africa, undulant fever from the Mediterranean coasts. Sir Patrick had very judiciously warned them not to believe that because a fever had been contracted in or was occurring in a patient from the tropics it must necessarily be a tropical disease. On the other hand, a disease occurring for the first time some months after the patient's return from the tropics was not necessarily ordinary disease, but might be a tropical disease contracted long previously within the tropics. They knew of several tropical diseases which might present a prolonged period of incubation or latency, and thus manifest themselves not infrequently some time after the patient's return from the tropics. The patient, of course, was altogether unaware of the infection, which did not previously give rise to any appreciable morbid manifestation either at the place in which it was contracted or on the journey home. The disease might have all the appearances of having been contracted at home some time after landing, and yet it was a tropical disease. Examples of tropical disease which might manifest themselves for the first time in England after a long period of latency were sprue, blackwater fever, malaria, sleeping sickness, and leprosy. Physicians should be prepared to meet with tropical diseases even in people who had never been to the tropics, and, indeed, in people who had never been out of this country. He need hardly mention plague and cholera, because these diseases had been imported again and again, and in past times had even given rise to great and deadly epidemics in these islands. But, just as plague might be introduced from abroad by infected rats, so might other diseases be brought over with their respective carriers. He might mention yellow fever, which had been imported several times into the large seaport towns of the Iberian peninsula and once in this country (Swansea, 1865) with infected mosquitos brought over in cargo ships from the West Indies. Like yellow fever, filariasis might be introduced with mosquitos harbouring the larval parasite. A well-authenticated case was described in 1894 by Dr. M. Font y Torné in a Spaniard from Canet di Mar (Barcelona) who had never left his country. That man suffered from chyluria and enlargement of the scrotum, and his blood contained at night the ensheathed larvae of *Filaria bancrofti*. At one time ague was very prevalent in the fen districts of this country, and there was no reason why they should not again come across autochthonous cases of malaria. In Holland the disease, after almost disappearing for a time, had again become very prevalent. Another point was the use of the microscope in the diagnosis of tropical diseases. It was to the microscope that they owed their great discoveries in this branch of medicine, and it was on the microscope that they must rely for the diagnosis of tropical diseases. Without the microscope it was seldom possible to arrive at a correct diagnosis. But, as Sir Patrick Manson had justly remarked, the microscopical diagnosis must be carried out

by someone familiar not only with microscopical technique, but with the special parasitology of the tropics. Unless the microscopist were an expert his opinion was worse than useless. Take malaria, for instance; nothing was easier to detect by the microscope, and yet how frequently it was overlooked or mistaken. With regard to multiple infection, it was not the exception, but the rule. At one time it was believed that man could not suffer from more than one disease at the time; now they knew that several infections might coexist in the same patient, at the same time either aggravating or minimizing, certainly modifying, one another's agency. The sooner they grasped all the importance of the interaction of various pathogenic organisms the sooner they would be able to understand the complex etiology of disease, its multiple manifestations, its ever-changing sequelae. Whilst pursuing his studies of comparative pathology at the London Zoological Gardens and elsewhere he had often come across amazing cases of multitudinous parasitism. In the *Field* newspaper, September 21st, 1907, he had described a very interesting case of multiple infection in a red grouse (*Lagopus scoticus*). That bird presented a parasitic fly (*Ornithomyia lagopidis*) and two lice (*Goniodes tetraemus* and *Nirmus cameratus*) on its skin; a microfilaria (*Filaria* sp.) and two protozoal organisms (*Leucocytozoon lovati* and *Haemoproteus mansonii*) in its blood; two tapeworms (*Davainea urogalli* and *Hymenolepis microps*) and a round worm (*Trichostrongylus pergracilis*) in its intestine. Most of these parasites were found in prodigious numbers. Some months later, in examining the larger tapeworms found in this grouse, he discovered that they were not all specimens of *Davainea urogalli*, as he had supposed, but that amongst them were specimens of another tapeworm (*Drepanidoteenia lanceolata*) which had never been found previously in the grouse. Had he looked more carefully he would have been able to add considerably to the list, but he did not trouble about fungi and bacteria. As a rule they found only what they looked for, and, even to find that they must know how to search and look very carefully and often repeatedly. The first parasite they came across was not necessarily the sole cause of the morbid condition they were endeavouring to explain, although it might have or might not have had some part in its causation. The peculiar habits of a man might play an important part in the acquirement of certain infections. It was possible, therefore, that a knowledge of the habits of a patient might be of some slight assistance in leading to a correct diagnosis of his case. A Jew or a Mohammedan, strictly observant of his religion, was not likely to harbour the pork-measle tapeworm (*Taenia solium*) or suffer from trichinosis. A man careless in matters of food and drink was far more likely to contract such diseases as were conveyed in infected meat and polluted water than the one who thoroughly cooked his food and boiled the water he drank. Malaria and many other tropical diseases were contracted through the bite of infected mosquitos and other blood-sucking arthropods which played a necessary part in the fostering and dissemination of such diseases. With regard to these diseases, the use of the mosquito net was a most efficient protection. People who would not believe in these precautions, or who would not take the trouble to carry them out must inevitably pay the penalty of their folly. Close contact with the native, taking shelter within his compounds and beneath his very roof, was a dangerous source of infection. Take plague, for instance. In many Eastern towns, during epidemics of plague, white men of the better class, living apart from the natives, usually escaped, whilst the mean whites, or those obliged to associate constantly with the natives, fell easy victims. In speaking of habits, one point which he considered of very great importance was sexual intercourse with native women. Quite recently Dr. E. Brumpt, at a meeting of the Paris Society of Tropical Medicine, stated that he had found the relapsing fever parasite (*Spirochaudinnia recurrentis*) in the menstrual blood of a female patient. That a blood parasite should be found in the catamenial discharge was only what might have been expected, but he (the speaker) was inclined to give it a greater significance. Take sleeping sickness, for instance. They knew that the parasite of this disease, the *Trypanosoma gambiense*, was found in the blood. They further supposed, on very good grounds, that it

was transmitted by the dusky tsetse fly, *Glossina palpalis*. But they also knew of certain limited epidemics of sleeping sickness in which some other mode of infection must have been in operation. Professor Koch was the first to suggest the possibility of contagion by means of sexual intercourse. A very similar trypanosomiasis of horses, called dourine or *maladie du coït*, is known to be transmitted chiefly, if not solely, by sexual intercourse. Now, if the relapsing fever parasite might reach the genital tract by means of the menstrual blood, it was only reasonable to infer that the trypanosome of sleeping sickness and the treponema of syphilis might likewise follow the same route. The infection of relapsing fever, like that of syphilis, had frequently been traced to the brothel, though usually ascribed to the vermin infesting such places. He could not help thinking that the Jewish laws which regarded a woman unclean during the catamenial period and for seven full days after its cessation, must have been formulated on account of the knowledge of some positive danger attending intercourse at that time. This would be in perfect accordance with the many other wise restrictions for which they justly regarded the Jews as the creators of the science of public hygiene. In Italy, and in the South of France, it was a popular belief that venereal diseases were the outcome of sexual intercourse during or immediately after menstruation. All this suggested the reasonableness of looking upon the menstruating woman as a possible source of infection with regard to certain diseases.

NORTH OF ENGLAND BRANCH:

NORTHUMBERLAND COMMITTEE.

A MEETING of this Committee was held at the Royal Victoria Infirmary, Newcastle-upon-Tyne, on March 25th; Mr. RUTHERFORD MORISON presiding.

Confirmation of Minutes.—The minutes of the previous meeting were read and confirmed.

Midwives.—Dr. CLARK BURMAN produced amended rules which had been adopted by the Alnwick Nursing Association altering the rule previously approved by this Committee whereby nurses only attended cases where a doctor had been engaged. He also produced correspondence thereon, and said that the Alnwick Division would probably strenuously resist the new procedure.

Bonesetters' Certificates.—After discussion, the Committee decided that if the Miners' Permanent Relief Fund chose to act on bonesetters' certificates, they would probably find considerable calls on their funds, and that at present no further action should be taken by the medical men.

Friendly Society Appointments.—It was resolved that a notice should be sent to all members of the British Medical Association in the county every year reminding them of the rules as to acceptance of these appointments, including the rules against recognition of the National Deposit Friendly Society.

Insurance Examinations.—The SECRETARY reported as to replies he had received from certain Divisions on the subject of recent attempts on the part of certain industrial societies to lower the fees for medical examinations. The reply of the Morpeth Division that 5s. should be the minimum fee for industrial examinations, 10s. 6d. if urinary analysis, and £1 1s. and upwards for cases requiring detailed examinations, was considered satisfactory. It being understood that the lower fees applied only to small insurances or scales of benefit.

County Co-operation.—The SECRETARY reported as to arrangements he was making to secure uniformity in all county Divisions as regards contract practice rules and for relieving secretaries of Divisions of a certain amount of clerical work. It was decided that a special meeting should be held to consider a scheme to carry this out.

SOUTHERN BRANCH:

PORTSMOUTH DIVISION.

A CLINICAL meeting was held at 5, Pembroke Road, Southsea, on March 24th. The CHAIRMAN (Dr. Carling) and seven members were present.

Case.—Mr. CHILDE showed a case in which excision of the external carotid artery and its branches had been performed previous to removal of a round-celled sarcoma of the tonsil in a boy aged 20. Also a case in which

double enterectomy had been performed fourteen months previously for malignant disease of the intestine, the patient remaining in good health.

Papers.—Mr. RIDOUT read an account of a successful enterectomy for intussusception occurring as the result of a round-celled sarcoma in the small intestine. (See p. 839 of this week's JOURNAL.) Mr. CHILDE read a paper on 36 cases of abdominal hysterectomy and myomectomy for fibromyoma of the uterus, and drew attention to the symptoms and indications for operation.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

COUNCIL MEETING.

A MEETING of the Council will be held at 2 o'clock in the afternoon of Wednesday, April 28th, in the new Council Room, at 429, Strand, London, W.C.

By Order,

GUY ELLISTON.

March 25th, 1909.

BRANCH AND DIVISION MEETINGS TO BE HELD.

DORSET AND WEST HANTS BRANCH.—The spring meeting of this Branch will be held in Dorchester on Wednesday, May 5th. Members wishing to read papers, show cases, exhibit specimens, or propose new members, are requested to communicate, not later than Thursday, April 22nd with JAMES DAVISON, Honorary Secretary, "Streteplace," Bournemouth.

DORSET AND WEST HANTS BRANCH AND WEST SOMERSET BRANCH.—Nominations for the office of a Representative on the Central Council should be sent, on or before Tuesday, April 13th next, in accordance with By-law 25, to JAMES DAVISON, "Streteplace," Bath Road, Bournemouth.

EAST ANGLIAN BRANCH.—The spring meeting will be held at Bury St. Edmunds on Thursday, April 15th. Members wishing to read papers or show cases should communicate at once with Dr. Gutch, Ipswich, the Honorary Secretary for Suffolk.—B. H. NICHOLSON, Senior Secretary, East Lodge, Colchester.

LANCASHIRE AND CHESHIRE BRANCH.—Change of date of Branch Council meeting. Owing to April 14th falling in Easter week the Branch Council meeting will be held a week earlier—namely, on Wednesday, April 7th, 4.30 p.m., at Onward Buildings, 207, Deansgate, Manchester.—F. CHARLES LARKIN, Honorary Secretary, Liverpool.

LANCASHIRE AND CHESHIRE BRANCH: ALTRINCHAM DIVISION.—A general meeting will be held at the Greenbank Hotel, Northwich, at 5 p.m., on Wednesday, April 21st, to receive reports from the Executive Committee, to consider matters referred to Divisions, and to transact the usual business. At 6 p.m. Dr. Mauwaring White will read a paper on Frontal Sinusitis as a Complication of Influenza. Dinner at 7 p.m.—T. W. H. GARSTANG, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: WALTHAMSTOW DIVISION.—The next meeting of the Division will be held at the Walthamstow Hospital, on Tuesday, April 6th, at 4 p.m. Agenda: 1. Minutes. 2. Letters. 3. Medical Inspection of School Children. 4. Papers and Cases by Members.—A. POTTINGER ELDRED, Honorary Secretary.

NORTH WALES BRANCH.—The spring intermediate meeting of this Branch will be held at Colwyn Bay, on Tuesday, April 20th. Members having papers to read, cases or specimens to show, are requested to notify the Honorary Secretary before April 7th. H. JONES ROBERTS, Llywernarth, Penygroes S.O., Honorary Secretary.

SOUTH-EASTERN OF IRELAND BRANCH.—A meeting of this Branch, also a meeting of the Branch Council and the local Division, will be held at Adelphi Hotel, Waterford, on Wednesday, April 7th, at 3.15 p.m. Agenda: (1) Minutes of last meeting. (2) Letters of apology. (3) Correspondence. (4) Dr. Laffan will move that dinners at Branch meetings be paid for at so much to each member present and half of that amount to each absent member. (5) Dr. Mackey will move that members of this Branch bind themselves not to accept a less fee than one guinea for examination and report in any case under the Employers' Liability Act or Workmen's Compensation Act at common law, whether same be furnished on behalf of employers or insurance companies. (6) Any other business.—J. QUIRKE, Honorary Secretary, Piltown.

CENTRAL MIDWIVES BOARD.

A SPECIAL meeting of the Central Midwives Board was held on March 23rd at Caxton House, Westminster, with Dr. F. H. CHAMPNEYS in the chair.

MIDWIVES STRUCK OFF THE ROLL.

The Board considered the following charges amongst others against the midwives whose names are given below and ordered them to be struck off the Roll.

Mary Jane Blackler, that being in attendance as a midwife at a confinement, the patient suffering from severe sickness and pains in the back, she did not explain that the case was one in which the attendance of a registered medical practitioner was required, nor did she hand to the husband or the nearest relative or friend present the form of sending for medical help, properly filled up and signed by her, as required by Rules E. 13 and 19.

Phyllis Botfield, that being in attendance as a midwife at a confinement, the patient being ill, suffering from diarrhoea, with high temperature, about the seventh day, she did not send for a doctor.

Suzanne Burrow, that being in attendance as a midwife at a confinement, the child's eyes being inflamed on the third day, she did not send for a doctor.

Dorothy Hudson, that she had been convicted of stealing.

Jane Lawrence, that being in attendance as a midwife at a confinement, the patient suffering from abdominal pain, chill, and rigor, she did not send for a doctor.

Mary Ann Quainton, that being in attendance as a midwife at a confinement, the patient suffering from a severe shivering fit, with considerable pain in the side, she did not send for a doctor.

Anna Maria Richardson, that being in attendance as a midwife at a confinement, the placenta and membranes not having been expelled two hours after the birth of the child, she did not send for a doctor.

Elizabeth Townsend, that being in attendance as a midwife at a confinement, the presentation being abnormal, she did not send for a doctor.

Julia Walters, that being in attendance as a midwife at a confinement, the child being stillborn, and no registered medical practitioner having been in attendance, she failed to notify the Local Supervising Authority, as required by Rule E. 20.

Frances Mary Wills, that being in attendance as a midwife at a confinement, the patient suffering from persistent vomiting and headache shortly after the confinement, from abdominal pain and feverishness on the third day, and from rigor on the fifth day, she did not send for a doctor.

Ruth Kitching, **Susan Jane Lonsdale**, and **Harriet Tovey**, that they were uncleanly and did not take with them to confinements the appliances and antiseptics required by Rule E. 2.

Elizabeth Mary Bothwell, for habitual drunkenness.

Annie Gordon, that on March 9th, 1895, she was convicted of having unlawfully and feloniously used an instrument with intent to procure miscarriage, and was thereupon sentenced to be kept in penal servitude for a term of five years. That on October 27th, 1904, she procured the grant of a certificate to her by the Central Midwives Board by causing to be made and by producing a false and fraudulent certificate of good moral character.

Sarah Ann Marsh, that she had been convicted for being drunk and disorderly during the years 1902 to 1904, and that on April 27th, 1905, she procured the grant of a certificate to her by the Central Midwives Board, by making a false and fraudulent representation that she was trustworthy, sober, and of good moral character, and by causing to be made and by producing a false and fraudulent certificate to this effect.

The documents relating to the last two cases were ordered to be sent to the Public Prosecutor.

MIDWIVES CAUTIONED.

The following midwives were cautioned after charges against them had been considered: Margaret Aldred, Alice Mary Bolton, Frances Curtis.

MIDWIVES CENSURED.

Elizabeth May, and Minnie Elizabeth Stevenson were censured after charges against them had been considered.

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

IN seventy-six of the largest English towns, including London, 4,489 births and 6,253 deaths were registered during the week ending Saturday last, March 27th. The annual rate of mortality in these towns, which had been 22.1 per 1,000 in each of the two preceding weeks, declined last week to 19.3 per 1,000. The rates in the several towns ranged from 9.4 in East Ham, 10.4 in Sitchwick, 10.7 in Devonport, 10.9 in Leyton, 11.1 in Handsworth (Staffs), 11.7 in Wilsden and in Coventry, and 12.5 in Horsey, to 24.8 in Middlesbrough, 25.9 in Liverpool, 26.5 in Swansea, 31.5 in Brighton, 31.5 in Wigan, 36.1 in Great Yarmouth, and 38.9 in St. Helens. In London the rate of mortality was 21.5 per 1,000, while it averaged 19.2 per 1,000 in the seventy-five other large towns.

.....

DIARY FOR THE WEEK.

TUESDAY.

ROYAL SOCIETY OF MEDICINE:

PATHOLOGICAL SECTION, National Hospital, Queen Square, W.C. 8.30 p.m.—Exhibition of Specimens.

THERAPEUTICAL AND PHARMACOLOGICAL SECTION, 20, Hanover Square, W., 4.30 p.m.—Papers: (1) Dr. Gordon Sharp: Experiments and Experiences with the Heart Tonics.—Pharmacological and Clinical. (2) Dr. Williams Bain: The Action of the Digestive Ferments upon Each Other.

POST-GRADUATE COURSES AND LECTURES.

LONDON SCHOOL OF CLINICAL MEDICINE, Seamen's Hospital, Greenwich.—Daily arrangements: Out-patient Demonstration, 10 a.m.; Medical and Surgical Clinics, 2.15 p.m. and 3.15 p.m. respectively; Operations, 2 p.m. Special Clinics: Ear and Throat, at noon and 4 p.m., Monday, and noon, Thursday; Skin, at noon and 4 p.m., Thursday, and noon, Friday; Eye, 11 a.m., Wednesday and Saturday; Radiography, 4 p.m., Thursday.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.—Monday, Clinics, 10 a.m., Surgical Out-patient, 2.30 p.m., Medical Out-patient: Nose, Throat, and Ear; X Rays: 4.30 p.m., Medical In-patient. Tuesday, 10 a.m., Medical Out-patient Clinic: 2.30 p.m., Operations; Clinics, Surgical, Gynaecological; 3 p.m., Demonstration on the Infectious Fevers (at the North-Eastern Fever Hospital, St. Ann's Road, N.). Wednesday, 2.30 p.m., Medical Out-patient, Skin, and Eye Clinics. Thursday, 2.30 p.m.,

Gynaecological Operations; Clinics: Medical Out-patient; Surgical Out-patient; X Rays: 3 p.m., Medical In-patient; Demonstration on the Infectious Fevers (at the North-Eastern Fever Hospital, St. Ann's Road, N.). Friday, Clinic: 10 a.m., Surgical Out-patient: 2.30 p.m., Operations; Clinics: Medical Out-patient, Eye; 3 p.m., Medical In-patient.

BIRTHS, MARRIAGES, AND DEATHS.

The charges for inserting announcements of Births, Marriages, and Deaths is 3s. 6d., which sum should be forwarded in post-office orders or stamps with the notice not later than Wednesday morning, in order to ensure insertion in the current issue.

BIRTHS.

McRAE.—On Friday, March 26th, at Glengall House, Ayr, the wife of G. Douglas McRae, M.D., F.R.C.P.E., of a son, surviving only thirty-six hours.

RANKINE.—On March 17th, at Westfield House, Rowletown, Carlisle, the wife of J. L. Rankine, M.R.C.S., of a son.

SCOTT.—On March 31st, at 46, Queen Anne Street, Cavendish Square, W., the wife of Sydney R. Scott, M.S.Lond., F.R.C.S. Eng., of a son.

DEATHS.

HARDIE.—At Kersal, The Cliff, Higher Broughton, Manchester, on March 27th, James Hardie, M.D., F.R.C.S., aged 67. Friends will kindly accept this intimation.

TAYLOR.—On March 21st, at Wray Croft, Lacock, Chippenham, Wilt., Mary Fanny, dearly loved wife of S. H. Stanley Taylor, M.B., Ch.B., and daughter of the late Arthur F. Roberts and Fanny Roberts, of Craycombe, Pershore, Worcestershire, aged 28.

ANNUAL MEETING, BRITISH MEDICAL ASSOCIATION, BELFAST, 1909.

The Seventy-seventh Annual Meeting of the British Medical Association will be held at Belfast from July 23rd, to July 31st, 1909, under the Presidency of Sir William Whitla.

The Annual Representative Meeting commences in Belfast on July 23rd. The Presidential Address will be delivered on July 27th. The Sections will meet on July 28th, 29th, and 30th.

A preliminary programme of arrangements was published in the SUPPLEMENT, February 27th, 1909. The Honorary Local Secretaries are: Henry Lawrence McKisack, M.D., M.R.C.P., 17, University Square, Belfast; Cecil Edward Shaw, M.A., M.D., M.Ch., 23, University Square, Belfast; and Howard Stevenson, B.A., M.B., F.R.C.S.I., 2, College Square North, Belfast.

SPECIAL NOTICE TO MEMBERS.

Every member is requested to preserve this "Supplement," which contains matters specially referred to Divisions, until the subjects have been discussed by the Division to which he belongs. BY ORDER.

MATTERS REFERRED TO DIVISIONS.

HOSPITALS COMMITTEE.

REPRESENTATION OF LOCAL MEDICAL PROFESSION ON BOARDS OF HOSPITALS AND SIMILAR BODIES.

The Annual Representative Meeting held at Sheffield decided that the following motions on the agenda, by the Hampstead and Wandsworth Divisions, respectively, should be referred to the Divisions before any opinion was pronounced:—

(a) *By the Hampstead Division (Metropolitan Counties Branch):*—

That in the interests of hospitals and their work it is desirable that medical practitioners should nominate representatives for election to Boards of Management of Hospitals in their respective localities, and that such nominations should be carried out by an organised professional body such as a Division of the British Medical Association:

(b) *By the Wandsworth Division (Metropolitan Counties Branch):*—

(i) That on all bodies formed to promote or control medical assistance for the sick, and which receive public subscriptions, there should be adequate direct representation of the medical profession resident in the district or districts affected:

(ii) That the conduct of the nominations and election of such representatives can be best carried out by the British Medical Association through its Branches or Divisions, as the case may be, on a scheme approved of by the members of the medical profession resident in the district or districts likely to be affected.

For the assistance of the Divisions in considering this important subject, the Hospitals Committee submits the following

MEMORANDUM.

1. The advantages of elected representatives of the local medical profession taking part in the general management of the hospitals of the district are doubtless obvious to most members of the profession.

2. It is, however, to be inferred from the proceedings of the last United Kingdom Hospitals Conference that such advantages are not at present obvious to the majority of laymen engaged in hospital administration.

It is desirable, therefore, that the Association, in deciding its policy upon this matter, should be clear as to the grounds of its decision.

3. It should be recognized that such representation is desirable in the interests of hospitals themselves and not merely in the interests of the medical profession.

4. Hospitals are benefited by the co-operation and support of the local medical profession and their work may be seriously prejudiced by its antagonism. Hospitals are dependent for their existence upon the work of their medical staff, and with respect to all questions affecting the terms of employment of the staff and conduct of the hospital members of the staff must be materially influenced by local professional opinion.

5. Experience shows the advantage of avoiding misunderstandings and conflict by making systematic provision for conference between authorised representatives of the interests concerned.

6. The association of officially recognised representatives of the local profession in the general management of hospitals affords a means whereby any proposals which might arouse opposition on the part of the profession may receive consideration in conference at an early stage, when amicable adjustment is so much easier than after opinions, based possibly on misunderstandings, have hardened on both sides.

7. The Committee has information of several cases in which, in recent years, hospitals have voluntarily associated in the general management representatives of the local profession.

8. For the appointment of such representatives there are obvious advantages in making use of the machinery afforded by organised bodies representative of the profession such as the Divisions of the British Medical Association.

9. In view of the above considerations the Hospitals Committee suggests that it would be well for members of Divisions to bring to the notice of influential representatives of Hospitals the desirability of associating representation of the medical profession in the management of these institutions where such representation does not at present exist, at first in a tentative manner, showing them that such a course is likely to prove useful to hospital patients and doctors alike, and thus inducing them to make the requisite appointments to the Governing Bodies of their several institutions.

10. The Divisions are requested to consider the motions of the Hampstead and Wandsworth Divisions, stated at the commencement of this Report, and the above suggestion of the Committee, and to instruct their Representatives with a view to the matter being voted upon in the Annual Representative Meeting.

Meetings of Branches & Divisions.

The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.

BIRMINGHAM BRANCH:

NEUNTON AND TAMWORTH DIVISION.

A MEETING of this Division was held at Tamworth General Hospital on February 23rd. 1909. Dr. SCULTHORPE, Chairman, presided, and there were present Drs. Joy, E. N. Nason, Robertson, Torbitt, and Wood.

Medical Inspection of School Children.—With regard to the questions referred to the Division under this heading, the following conclusions were arrived at:

1. The Division approves of system of payment by adequate salary and disapproves of payment per head.
2. School clinics are disapproved in this Division, the size of the towns being too small for the purpose. If school clinics should be necessary, school children found defective should be paid for by case.
3. The surgeries of those practitioners willing to act should be recognized. The selection should be by the parent and the payment per case.
4. Payment should be made by the education authority. The amount disbursed should be recoverable by the authority from such parents as, in their opinion, are able to pay.

Whole-time Medical Officers of Health.—It was resolved:

That it is desirable that medical officers of health should be debarred from private practice.

Earlier Appointment of Representative.—It was resolved:

That Rule 7 of the Division rules be altered so that the Division may elect the Representative earlier than is now possible.

In Rule 7 alter three months to nine months.

LANCASHIRE AND CHESHIRE BRANCH:

MANCHESTER (WEST) DIVISION.

A GENERAL meeting of the Division was held in the Technical Institute, Old Trafford, on Thursday, March 25th, at 4 p.m. The following gentlemen attended: Drs. D'Ewart, Wallace Eales, Moeckler, Nichol, Skardon Prowse, L. E. Scanlon, and F. H. Worswick. Dr. WORSWICK took the chair.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Letter from Chelsea and Fulham Division.—A letter from the Chelsea and Fulham Division, calling attention to the following resolution, was considered:

That we, the Chelsea and Fulham Division of the British Medical Association, deeply regret and resent the action of the Council of the Royal College of Surgeons of England, in that, having ascertained the wishes of a majority of the Fellows and Members of that College, they should deliberately flout that opinion in the recent alteration of their by-laws.

It was resolved:

That this meeting cordially supports the action of the Chelsea and Fulham Division.

Medical Inspection and Treatment of School Children.—The meeting adopted, with the undermentioned exceptions, the resolutions of the Manchester and Salford Divisional Joint Committee regarding the medical inspection and treatment of school children:

Medical Inspection.

Joint Committee's resolution (A. 4) reads as follows:

Teachers should be trained to observe indications of ill-health in the children under their care, and should forthwith bring these children to the notice of the proper medical authority.

The meeting was of opinion that the training of teachers in the symptoms of disease is unnecessary, ordinary methods of observation being quite sufficient for what is required.

Medical Treatment.

In connexion with Resolution B. 6 of the Joint Committee, which deals with the institution of recognized surgeries, the meeting considered that no special selection of surgeries should be made by the authorities, but that the surgeries of all registered medical practitioners who are willing to do the work should be recognized places for treatment, so that parents may exercise a free choice among the practitioners in their district.

Correspondence.—Letters from the Secretary of the Departmental Committee re Midwives Act, and from the Medical Secretary acknowledging the receipt of resolutions from this Division were read.

Scientific Work of Branches and Divisions.—The meeting approved of the suggested conversion of the Central Library of the Association into a circulating library if that plan should prove practicable. It was resolved:

That the Joint Committee of the Manchester and Salford Divisions be asked to approach the various medical societies in Manchester which possess libraries, with the view of testing their willingness to consider a scheme for extending the privilege of the use of such libraries to all members resident within the area of the Manchester and Salford Divisions.

Scientific Meeting.—The Executive Committee was instructed to arrange for a scientific meeting of the Division at the earliest practicable date.

Medical Certification of Suitability for Hospital Treatment.—With regard to the medical certification of the suitability of patients for hospital treatment, the Division adopted the recommendation of the Council of the Association, with the addition of the word "urgent" as qualifying "casualties," in the last sentence.

Contributions to Hospitals by Employers and Employees.—Some discussion took place on the report on contributions to hospitals by employers of labour and employees, and it was resolved, in view of its complexity, to postpone further consideration of the subject until the next meeting of the Division.

Fresh Public Medical Institutions.—The meeting approved of the principle enunciated in the resolution referred to the Divisions by the Sheffield Representative Meeting in connexion with the establishment of fresh public medical institutions. It was proposed by Dr. D'Ewart, seconded by Dr. NICHOL, and resolved:

That the Manchester and Salford Joint Committee be requested to consider the feasibility of forming a board in Manchester for the control of hospital extension, etc., on lines similar to that of the King's Fund in London.

Sanatoriums for Workers suffering from Tuberculosis.—The meeting endorsed the resolution contained in the report of the Joint Committee of the Medico-Political and Hospitals Committees on Sanatoriums for Workers suffering from Tuberculosis.

Midwives Act.—The circular from the Medical Secretary concerning the action of the Association in connexion with the work of the Departmental Committee re Midwives Act was read, and the HONORARY SECRETARY stated that the information asked for had been supplied through the Manchester and Salford Joint Committee.

Representation of Profession on Local Councils and in Parliament.—The following resolution, proposed by Dr. D'Ewart and seconded by Dr. L. E. SCANLON, was agreed to by the meeting:

That this Division desires the Manchester and Salford Joint Committee to consider the question of securing suitable and adequate representation of the medical profession upon the Town Councils of Manchester and Salford; and further to consider what methods should be taken locally to secure adequate voicing of medical opinion in Parliament.

Fees in Police Cases.—With regard to fees in police cases, it was resolved:

That the Joint Committee of the Manchester and Salford Divisions be urged to approach the Manchester Watch Committee with the view of inducing that body to adopt the metropolitan police system of paying general practitioners for services rendered.

It was pointed out that the Manchester Baths and Tramways Committees had agreed to a definite scale of fees to be paid to practitioners for first aid in all casualty cases.

Joint Committee of Local Divisions as Mouthpiece of the Profession.—The suggestion put forward by the Manchester (South) Division, that the Joint Committee of the local Divisions should endeavour to obtain official recognition of itself as the mouthpiece of the profession in Manchester and Salford, was cordially supported by the meeting.

NORTH OF ENGLAND BRANCH:

NORTH NORTHUMBERLAND DIVISION.

An ordinary meeting was held on March 31st, at 2.30 p.m., in the Blue Bell Hotel, Belford. There were present: Drs. Main, Coldstream, Burrow, Macdonald, Purves, Robson, and Burman. Dr. MAIN was voted to the chair.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Apologies for Non-attendance.—Apologies for absence were received from Drs. Mackay and Shand.

Northumberland County Nursing Association.—The SECRETARY reported that in the new rules for the county association maternity nurse stationed at Alnwick, Rule 3 had been altered from:

The nurse may only book cases which a doctor has been engaged to attend,

to

The nurse may only take maternity cases without a doctor by leave of the managing committee;

and called attention to the anomalous position the Division was placed in by the alteration, which rendered the resolution passed by the Division on September 18th, 1908, quite nugatory. A prolonged discussion followed, and a letter from the President of the association, dated December 22nd, 1908, in which the following sentence occurs, "The N.C.N.A. will continue to leave the matter to local committees to settle with local medical men," was read. It having been proved that no such action had been taken, and a letter from the local secretary read in reply to one from the Secretary calling attention to the alteration of the rule, the following resolution was proposed by Dr. ROBINSON, seconded by Dr. PURVES, and carried unanimously:

That this meeting regrets the alteration of Rule 3 after the resolution passed by the Division on September 18th, 1908, and forwarded to the Secretary of the Association, and is of opinion that whether this alteration is maintained or not, in the interests of the sick poor and the medical profession, the medical men practising in all districts should be members of the local nursing managing committees.

The Secretary was instructed to forward this resolution to the secretary of the Northumberland County Nursing Association together with a covering letter explaining the several points discussed at the meeting.

Treatment of School Children found Defective.—Dr. BURROW opened a discussion on the treatment of school children found upon medical inspection to be defective, and gave some interesting statistics of the percentage of the various forms of disease under their respective headings, pointing out the difficulties of treatment in rural as compared with urban districts. An interesting discussion followed, in which all the members took part; and, after Dr. Burrow had answered questions arising out of his paper, it was agreed that any treatment of school children found defective should be paid for at the usual rate of professional charges according to local conditions; that local practitioners be asked to treat such cases, and if any hospital treatment was required to advise the same; but it was very distinctly urged that if the services of a local hospital were utilized for the performance of any operation which was suggested by the education authorities, such authorities should be responsible for the payment of such fees as the hospital committee fixed. School clinics were not recommended, and it was agreed that all local practitioners should have equal opportunities to carry out treat-

ment when called for. A vote of thanks to Dr. Burrow for his paper was unanimously carried.

British Temperance and General Collecting Society.

A communication from the Secretary of the Northumberland Committee *re* British Temperance and General Collecting Society was read, and the Secretary was requested to inform the Committee that the Division fix the minimum fee at 5s. for any proposal of £50 or below, provided the report was not one involving a detailed examination, or the examination of urine.

Tea.—The members were entertained at tea by Dr. Main.

OXFORD AND READING BRANCH:

OXFORD DIVISION.

A GENERAL meeting of this Division was held on Friday, March 26th, at the Radcliffe Infirmary, Oxford, at 3.15 p.m. Mr. WHITELOCKE was in the chair, and twenty-nine members attended.

Confirmation of Minutes.—The minutes of the previous meeting were read and confirmed.

Functional Dyspepsia.—The CHAIRMAN introduced Dr. ROBERT HUTCHISON, of the London Hospital, who opened a discussion on the treatment of functional dyspepsia. After alluding to the difficulties of a scientific classification, Dr. Hutchison suggested the recognition of three main clinical types of functional dyspepsia: (1) Hypersthenic type, associated with hyperchlorhydria, chiefly found in young men; (2) asthenic type, with defective motility and flatulence, in both sexes; (3) hyperaesthetic, found in young women. He further mentioned the "acid type," typical of elderly people with gouty tendencies. He then proceeded to deal with the treatment, dietetic and medicinal, of the various types. In the hypersthenic cases, the avoidance of secretory stimulants—for example, salt, condiments, and alcohol—was important, and an animal diet was most suitable. Medicinally, the use of the earthy carbonates, which were insoluble, was recommended, the aim being to neutralize secretion. For the asthenic types the diet should be pulped and dry—for example, minced food. Strychnine and ipecacuanha were useful as motor stimulants, and, in the reader's opinion, aloes seemed to have an effect upon the stomach analogous to that upon the colon. Electricity and massage he had found somewhat disappointing. For the hyperaesthetic cases, "feeding up" was important, though at first the diet should be bland. Sedatives, and especially bismuth, were indicated. The application of local heat in the form of hot poultices was sometimes very beneficial. The acid dyspepsias benefited from the limitation of carbohydrates and the use of antacids. Doubt was thrown upon the value of diastatic ferments. In the discussion which followed, Dr. COLLIER alluded to the method of chewing red gum to neutralize the gastric secretion; he also drew attention to auto-massage of the stomach walls. Finally, he asked for an explanation of the formation of wind in the stomach, as he did not consider that fermentation could account for the enormous amount of gas formed. Dr. HUTCHISON, in replying, suggested that some of the "wind" resulted from air-swallowing, and he thought that possibly some of the gas was excreted from the blood circulating in the gastric vessels. A hearty vote of thanks was accorded to Dr. Hutchison, who had to leave early.

Colitis and Pericolitis.—Dr. GIBSON gave a short account of the pathology and symptoms of colitis and pericolitis, illustrated by two cases. In both there was chronic constipation, and some rise of temperature, and pain over the colon, with rigidity of abdominal muscles. Either some swelling or thickening was usually to be made out over some portion of the colon, and some peritonitis was present. Suppurative pericolitis might ensue.

Cases of Poisoning.—Dr. WYLIE gave an interesting account of 6 cases of poisoning he had had to deal with within a few months. All of them made a good recovery.

1. A case of oxalic acid poisoning in a man who had taken nearly half an ounce of salts of lemon. He was treated by injection of apomorphine $\frac{1}{10}$ grain, the stomach being washed out with chalk and water.

2. A woman who had taken 2 oz. of pennyroyal. Vomiting was induced by apomorphine, and kept up by draughts of vin. ipecacuanhae in water.

3. A case of morphia poisoning in a lady, who had taken a bottle of medicine containing 2 grains of morphia in one dose. The stomach was washed out with a weak solution of permanganate of potash; strychnine was given and artificial respira-

tion tried. Repeated washings out with the permanganate solution were successful after three hours' treatment.

4. A case of carbolic acid poisoning in a child aged 4½. Treated with apomorphine and the stomach washed out with a solution of sulphate of magnesia. White of egg and brandy given.

5. Child of 2 years, who had taken 1½ grains of opium in the form of R. camph. co. Recovered after the stomach had been washed out with permanganate solution, and the child being kept awake by walking about to open air.

6. A case of a man who drank a pint of paraffin oil in mistake for beer. He was found in a very collapsed and excited state. Apomorphine was injected, and copious draughts of lukewarm water given; and, finally, a dose of brandy and castor oil.

Dr. Wylie advised every medical man to carry about with him Dr. Murrell's small book on poisons, which he had found most useful.

Cerebro-spinal Meningitis.—Dr. DUGAN read notes of a case of cerebro-spinal meningitis of the sporadic type. Except for a cold in the head and a slight attack of urticaria ten days previously, the patient, a girl aged 11, had no symptoms whatever till seized with pain in the head and convulsions of a general type at 4 a.m. In a few hours she became unconscious, and was deeply comatose when first seen at 8.30 a.m. She died four hours later without recovering consciousness. *Post mortem* the brain was congested, but there was no basal meningitis. A large hæmorrhage had taken place into the right temporo-sphenoidal lobe and a second one into the lateral ventricles. A pure culture of the *Diplococcus* or *Meningococcus unicellularis* was made by Dr. GIBSON. Dr. COLLIER read notes of another recent case, a boy living in the country, who was seized with headache and vomiting. There was great cerebral irritability and paresis of the left face and arm. Some pain in the ears suggested cerebral abscess. He was taken to hospital, but died the next day. Purulent meningitis was found *post mortem* and the *Diplococcus unicellularis* discovered. Since that time another child and the mother of the same family were showing symptoms suggestive of meningitis.

Business Management of the Association.—Dr. COLLIER proposed the following resolution:

That, in view of the practical experience of the last thirty-seven years, during which period the Association has enjoyed great financial prosperity, it has been proved that in the best interests of the British Medical Association it is essential to have an official with the rank and status of "General Secretary and Manager," and that such official should possess special business training.

Further, that having regard to the highly satisfactory manner in which Mr. Guy Elliston has discharged the duties since his appointment in 1902, it is in the interests of the Association that his services should be retained as "General Secretary and Manager"; and that the Representative of the Oxford Division to the Representative Meeting at Belfast be instructed accordingly.

This was seconded by Mr. DREW (Representative) and carried unanimously.

New Buckinghamshire Division.—The SECRETARY announced the formation of the new Buckinghamshire Division.

The Royal College of Surgeons of England.—A resolution received by the Secretary from the Secretary of the Chelsea and Fulham Division, regretting the action of the Council of the Royal College of Surgeons in the recent alteration of their by-laws, was read and laid on the table.

Matters Referred to Divisions.—A proposition was made by the SECRETARY, and seconded by the CHAIRMAN, that certain communications from the Medical Secretary concerning matters to be referred to the Divisions, including one concerning the working of the Midwives Act, be referred to the Executive Committee. Carried *nem. con.*

SOUTH-EASTERN BRANCH:

MAIDSTONE DIVISION.

A MEETING of this Division was held at the West Kent General Hospital on Thursday, March 11th, at 3 p.m., Mr. FRED. T. TRAVERS in the chair. There were also present: Drs. C. KILLICK, W. Shaw, T. Joyce, R. T. Caesar, G. Southwell Sander, A. Parr Dudley, W. Ryan, A. T. Falwasser, C. Pye Oliver, Geo. Potts.

Confirmation of Minutes.—The minutes of the previous meeting were read and confirmed.

Cases.—Cases were shown by Mr. TRAVERS, Mr. C. KILLICK, and Dr. SOUTHWELL SANDER.

Conference of Charity Association.—Drs. JOYCE and CAESAR gave an account of the conference of the Charity Association, at which they represented the Division.

Notice of Motion.—Dr. JOYCE gave notice that he would propose at the next meeting:

That this meeting is of opinion that it should be considered disgraceful conduct in a professional sense for any registered practitioner to supplant another who has been compelled to vacate any appointment on the ground that it is inadequately paid for; where such a statement of unremuneration has been found by the Medical Council to be well founded, an investigation should be insisted on.

STAFFORDSHIRE BRANCH:

SOUTH STAFFORDSHIRE DIVISION.

AN ordinary meeting of the Division was held on February 23rd, at 4.30 p.m., those present being Dr. BADGER, in the chair, Drs. Cholmeley, Cridland, Bailey, Harthill, and Somerset.

Resolutions.—It was resolved:

1. That the grouping of Branches as proposed was approved of by the Division.
2. That the Division noted counsel's opinion relating to the opposition to certain clauses in the Charter, but were not concerned with the said opposition.
3. That the Division approves of the principle of health officers (at least in the larger areas) being debarred from private practice, providing that the office carries with it in all cases sufficiency of salary and security of tenure, the interests of existing officials being recognized or compensated for. (Moved by Dr. BAILEY, seconded by Dr. CHOLMELEY.)
4. That except in certain special cases, the time has not yet arrived when treatment of the children found defective in the medical inspection of the elementary schools should be paid for at the expense of the public authorities.
5. The Secretary was instructed to obtain further information about the methods of giving certificates at hospitals.
6. The meeting agreed that the rules should be altered so as to allow the earlier appointment of the Representative in the Representative Meeting.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

COUNCIL MEETING.

A MEETING of the Council will be held at 2 o'clock in the afternoon of Wednesday, April 28th, in the new Council Room, at 429, Strand, London, W.C.

By Order,

March 25th, 1909.

GUY ELLISTON.

BRANCH AND DIVISION MEETINGS TO BE HELD.

BORDEN COUNTIES BRANCH: ENGLISH DIVISION.—A meeting of the Division will be held at the George Hotel, Penrith, on Friday, April 23rd, at 3 p.m. The Honorary Secretary will be pleased to hear from members who wish to read papers or show cases or pathological specimens.—NORMAN MACLAREN, Honorary Secretary, 23, Portland Square, Carlisle.

DORSET AND WEST HANTS BRANCH.—The spring meeting of this Branch will be held in Dorchester on Wednesday, May 5th. Members wishing to read papers, show cases, exhibit specimens, or propose new members, are requested to communicate, not later than Thursday, April 22nd with JAMES DAVISON, Honorary Secretary, "Streteplace," Bournemouth.

DORSET AND WEST HANTS BRANCH AND WEST SOMERSET BRANCH.—Nominations for the office of a Representative on the Central Council should be sent, on or before Tuesday, April 13th next, in accordance with By-law 25, to JAMES DAVISON, "Streteplace," Bath Road, Bournemouth.

EAST ANGLIAN BRANCH.—The spring meeting will be held at Bury St. Edmunds on Thursday, April 15th. Members wishing to read papers or show cases should communicate at once with Dr. Gutch, Ipswich, the Honorary Secretary for Suffolk.—B. H. NICHOLSON, Senior Secretary, East Lodge, Colchester.

LANCASHIRE AND CHESHIRE BRANCH: ALTRINCHAM DIVISION.—A general meeting will be held at the Greenbank Hotel, Northwich, at 5 p.m., on Wednesday, April 21st, to receive

reports from the Executive Committee, to consider matters referred to Divisions, and to transact the usual business. At 6 p.m. Dr. Manwaring White will read a paper on Frontal Sinusitis as a Complication of Influenza. Dinner at 7 p.m.—T. W. H. GARSTANG, Honorary Secretary.

METROPOLITAN COUNTIES BRANCH: RICHMOND DIVISION.—The next meeting of the Division will be held at the Royal Hospital, Richmond, on Wednesday, April 14th, at 8.30 p.m. A paper will be read by J. R. LEESON, M.A., M.D., entitled "Thirty-eight Years of Medical Life: a Retrospect and Prospect."—G. CARDNO STILLI, Honorary Secretary.

NORTH WALES BRANCH.—The spring intermediate meeting of this Branch will be held at Colwyn Bay, on Tuesday, April 20th. H. JONES ROBERTS, Llywenarth, Penygroes S.O., Honorary Secretary.

SOUTH-EASTERN BRANCH: MAIDSTONE DIVISION.—A meeting of the Maidstone Division will be held at the Kent County Ophthalmic Hospital, Maidstone, on Thursday, April 15th, at 3 p.m., when cases will be shown by Mr. C. Killick and Dr. Ryan. Dr. T. Joyce will propose the following resolution: "That this meeting is of opinion that it should be considered disgraceful conduct in a professional sense for any registered practitioner to supplant another who has been compelled to vacate any appointment on the ground that it is inadequately paid for. Where such a statement of unremuneration has been found by the Medical Council to be well founded an investigation should be insisted upon." It is particularly requested that members will endeavour to attend and, if possible, to show cases. Any member who desires to show cases or read papers will kindly communicate immediately with the Honorary Secretary.—GEORGE POTTS, Honorary Secretary.

SOUTH MIDLAND BRANCH: NORTHAMPTONSHIRE DIVISION.—A meeting of the Division will be held on Tuesday, April 20th, at 2.30, in the Board Room of the Northants General Hospital. There will be a luncheon beforehand at Franklin's Restaurant, Guildhall Road, at 1.30. Names of those wishing to attend the luncheon should be sent in two days beforehand to the Secretary. Business:—Report of Executive Committee. Matters referred to Divisions: (1) Report on medical certificates of suitability of patients for hospital treatment; (2) Report on contributions to hospitals by employers of labour and employees; (3) Statement as to fresh public medical institutions; (4) Statement as to sanatoriums for workers suffering from tuberculosis (cf. SUPPLEMENT, February 27th); (5) Departmental Committee re Midwives Act; (6) Questions of health officers being whole-time officers (cf. SUPPLEMENT, January 23rd). Clinical cases.

ULSTER BRANCH.—The spring meeting of this Branch will be held in Londonderry on Saturday, May 8th. Members having communications to make to the meeting are requested to send particulars not later than April 30th to CECIL SHAW, Honorary Secretary, 29, University Square, Belfast.

Naval and Military Appointments.

EXCHANGE.

The charge for inserting notices respecting Exchanges in the Army Medical Department is 3s. 6d., which should be forwarded in stamps or post office order with the notice, not later than Wednesday morning, in order to ensure insertion in the current issue.

EXCHANGE wanted by senior Lieutenant-Colonel due for India, beginning of September. Address, Lieutenant-Colonel Simpson, R.A.M. College, or by wire c/o. Jaspase, London.

ROYAL NAVY MEDICAL SERVICE.

SIR H. F. NORBERT, K.C.B., M.D., Honorary Surgeon to the King, Director-General (retired), has been awarded a good-service pension of £100 a year in the vacancy caused by the death of Director-General Sir John W. Reid on February 24th.

The following appointments have been made at the Admiralty: Staff Surgeon S. G. T. to the *Albatross*, recommissioned on April 13th; Surgeon G. G. VICKERY, M.B., to the *Triton*, March 30th; Fleet Surgeon E. R. D. FASER, and Surgeon S. F. DUDLEY to the *Terrible* and for the Division of Special Service Vessels at Portsmouth, April 1st.

Mr. A. G. DAMPIER-BENNETT has been appointed Surgeon and Agent at Kingstown and Dalkey, March 30th.

ARMY MEDICAL SERVICE.

COLONEL J. I. ROOTH, Half Pay List, is placed on retired pay, March 29th. He is appointed Surgeon, February 3rd, 1878; Surgeon-Major, February 3rd, 1880; Surgeon-Lieutenant-Colonel, February 3rd, 1888; Colonel, December 3rd, 1904; and retired on half pay, January 8th, 1906. He served with the Tirah Expeditionary Force during the campaign on the North-West Frontier of India in 1897-6, receiving a medal with two clasps.

ROYAL ARMY MEDICAL CORPS.

The details of the transfer from the Second List of Lieutenant-Colonel J. WILL, M.B., is for February 28th, 1909, and not, as stated in the *Gazette* of March 2nd, 1909.

Lieutenant M. G. DILL, M.B., from the Second List to be Lieutenant, March 14th. He was placed on the Second List for service with the Egyptian Army, February 14th, 1907.

Major A. P. HENKINSON has been appointed Assistant to the Commandant of the Royal Army Medical College.

Major F. J. W. PORTER, D.S.O., has been appointed Senior Medical Officer, West Africa, vice Major A. Pearce.

ROYAL ENGINEERS (VOLUNTEERS).

The resignation of Surgeon-Major G. O. C. MACKNESS, M.D., the Tay Division, Submarine Miners, bears date March 31st, 1908, and not as stated in the *London Gazette* of November 1st, 1907.

TERRITORIAL OFFICERS' DECORATIONS.

The King has been pleased to confer the Territorial Decoration upon the undermentioned officers of the Territorial Force who have been duly recommended for the same under the terms of the Royal Warrant, dated August 17th, 1908:

YEOMANRY.

TERRITORIAL FORCE.

Surgeon-Lieutenant W. S. HENDERSON, M.D., from the King's Colonials Imperial Yeomanry, to be Surgeon-Lieutenant, King's Colonials Yeomanry, with precedence as in the Imperial Yeomanry, April 1, 1908.

The announcement of the transfer of Surgeon-Lieutenant W. S. HENDERSON, M.D., from the King's Colonials, Imperial Yeomanry, which appeared in the *London Gazette* of October 20th, 1908, is cancelled.

Surgeon-Captain O. C. MATRICE, Royal Wiltshire (Prince of Wales's Own Regiment), to be Surgeon-Major, March 5th.

Surgeon-Major R. BULLOCK, Warwickshire Yeomanry, is granted the honorary rank of Surgeon-Lieutenant-Colonel, March 31st, 1908.

INFANTRY.

Surgeon-Captain G. B. ROBINSON, M.D., 5th Battalion the King's (Liverpool Regiment), resigns his commission, February 9th.

Surgeon-Captain J. M. AHERN, 8th (Irish) Battalion the King's (Liverpool Regiment), resigns his commission, February 12th.

The announcement of the transfer and promotion of Surgeon-Major J. W. ELLIS, 3rd Battalion the King's (Liverpool Regiment), which appeared in the *London Gazette* of October 6th, 1908, is cancelled.

Surgeon-Major G. M. LOWE, M.D., 4th Battalion the Lincolnshire Regiment, is granted the honorary rank of Surgeon-Lieutenant-Colonel, March 31st, 1908.

ROYAL ARMY MEDICAL CORPS.

First West Lancashire Field Ambulance.—Captain A. G. GULLAN, M.D., to be Major, December 13th, 1908.

First Northumbrian Field Ambulance.—ARTHUR G. DIXON, M.B., to be Lieutenant, October 21st, 1908.

Third Wessex Field Ambulance.—Lieutenant F. E. STOKES, from the Royal Army Medical Corps, Territorial Force, to be Lieutenant, May 19th, 1908.

Lieutenant-Colonel J. M. HARPER is granted the honorary rank of Surgeon-Colonel, March 31st, 1908.

London Mounted Brigade Field Ambulance.—Major (Honorary Major in the Army) CHARLES STONHAM, C.M.G., from the Royal Army Medical Corps (Territorial Force), to be Lieutenant-Colonel, March 5th. HENRY ROBINSON, M.D., and ALEXANDER FINDLATER, M.D., to be Lieutenants, March 5th.

Second East Anglian Field Ambulance.—DUDLEY W. BOSWELL, M.D., to be Lieutenant, January 2nd.

First Highland Field Ambulance.—ARTHUR KELLAS to be Lieutenant, February 2nd.

First Home Counties Field Ambulance.—BERTRAM C. A. LEEPER to be Lieutenant, January 1st.

Second Northern General Hospital.—The appointment of E. F. TRAVELMAN, M.D., to the rank of Lieutenant-Colonel bears date July 7th, 1908, and not as stated in the *London Gazette* of February 23rd, 1909.

Fifth Northern General Hospital.—Officer whose services will be available on mobilization: Captain ROBERT STEWART, M.D., to be Major, February 2nd.

For Attachment to Units Other than Medical Units.—Captain E. L. PATON, M.B., to be Major, September 7th, 1908. OCTAVIUS R. ENXION to be Lieutenant, December 31st, 1908. ALEXANDER D. KENNEDY, M.D., to be Lieutenant, January 27th, 1909. ARTHUR ROBERTS, F.R.C.S. (Ed.), date Lieutenant, Berkshire Imperial Yeomanry, to be Captain, with seniority from February 8th, 1905, October 1st, 1908. HARRY R. SPIRO, M.D., to be Lieutenant, January 1st, 1909. Surgeon-Captain JOHN GAFFRITH, from the Gloucestershire Battalion the South Wales Borderers, to be Captain, March 1st, 1909.

Unattached List.—Surgeon-Major WILLIAM COX, from the 1st Gloucestershire Royal Engineers (Volunteers) is appointed, with rank and precedence as in the Volunteer Force, April 1st, 1908.

Vital Statistics.

HEALTH OF IRISH TOWNS.

DURING the week ending Saturday, March 27th, 636 births and 550 deaths were registered in the twenty-two principal urban districts of Ireland, as against 598 births and 571 deaths in the preceding period. The annual death-rate in these districts, which had been 22.5, 25.3, and 26.1 per 1,000 in the three preceding weeks, fell to 25.1 per 1,000 in the week under notice, this figure being 5.3 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 27.2 and 26.7 respectively, those in other districts ranging from 8.2 in Drogheda and 9.6 in

Ballymena to 27.5 in Armagh and 34.3 in Kilkenny, while Cork stood at 27.4, Londonderry at 18.1, Limerick at 16.4, and Waterford at 21.4. The zymotic death-rate in the twenty-two districts averaged 1.1 per 1,000, as against 1.3 per 1,000 in each of the three preceding weeks.

Hospitals and Asylums.

THE SANDLEBRIDGE COLONY FOR THE FEEBLE-MINDED.

THE report for 1908 of the Incorporated Lancashire and Cheshire Society for the Permanent Care of the Feeble-minded states that the Colony at Sandbridge, Cheshire, continues to grow. The number of inmates on October 1st, 1908, was 160 (93 boys and 67 girls), an increase of 103 (or 180 per cent.) during the last three years. There have been no deaths during the year, and only 4 have left the home; 7 boys work on the farm. 15 in the garden and greenhouses, and 20 girls are employed in laundry and house work; 140 of the inmates are under 16 years of age, and, being at school under the provisions of the Defective and Epileptic Children's Act, 1899, 139 of them in the year 1906-7 a Government grant amounting to £401 10s. 7d. Other sources of income are payments for maintenance from local authorities and from relatives of children amounting to £3,110 for the year, and £586 from subscriptions. A balance of £58 4s. 1d. of income over expenditure is carried to the capital balance sheet, so that the financial condition of the colony seems quite sound, though, of course, contributions are continually needed to meet the constant expansion of the Society's operations.

The report opens with a grateful reference to the invaluable services of the late Dr. Ashby, who devoted a large share of his time to promote the interests of the Sandbridge Colony. It is hoped permanently to commemorate his connexion therewith by the erection on the estate of a little hospital bearing his name, which seems to us a most appropriate memorial. The chief extension of the work during the past year was the opening as a residence for thirty older girls of Warford Hall, a mansion adjoining the colony which had been acquired with its beautiful gardens and grounds, to supplement the original estate, and to afford scope for the better training of the boys in horticulture, for which its extensive glass houses (since added to) offered facilities. The new Thomasson and Sam Gamble School Building proves very serviceable for the practical education of the 140 children of school age, whose work, under six teachers, is favourably commented on by the Inspector of the Board of Education. The final paragraph of his report is as follows:

"With the material provision for accommodation and suits added to their school, the committee is able to regard its institution as a model scheme of administration for handling the whole problem of the feeble-minded at every stage." It is this completeness of grasp of the necessities of the class that differentiates Sandbridge from most other establishments in this country for mentally defectives, and we sincerely congratulate Miss Dendy and those associated with her upon the encouraging results of ten years' work. We trust that any legislation that may follow the Report of the Royal Commission on the Feeble-Minded may tend to strengthen the hands of voluntary workers in this field of much-needed social service.

GOVAN DISTRICT ASYLUM, HAWKHEAD, PAISLEY.

THE annual report of Dr. W. R. Watson, the Medical Superintendent of the above asylum, for the year ending May 14th, 1908, shows that there were 553 patients on the register on May 15th, 1907, and that the number had increased to 580 on May 15th, 1908. The total cases under care during the year numbered 805, and the average number daily resident 565.6, as compared with 532.4 for the previous year. During the year 252 were admitted, of whom 215 were first and 37 not-first admissions. Of the total admissions, in 170 the attacks were first attacks within three, and in 16 more within twelve, months of admission; in 50 not-first attacks within twelve months of admission, and in the remainder the attacks were either of more than twelve months' duration (13) or of congenital origin (3) on admission. The total admissions were classified according to the several forms of mental disorder into: Mania, 32; melancholia, 80; dementia, 42; delusional insanity, 9; alcoholic insanity, 6; puerperal insanity, 2; general paralysis, 18; acquired epilepsy, 10; and congenital or infantile defect, 3. With regard to the supposed etiological factors, Dr. Watson gives detailed tabular statements, showing in each of the male and female first-attack admissions the form of mental disorder and the associated conditions. Concerning these cases, it was ascertained, Dr. Watson says, that 24.1 per cent. of the men and 8.6 of the women, or 16.7 per cent. of both sexes, were regarded as excessive drinkers; 20 per cent. suffered from affections of the heart or arteries; and 15.6 per cent. were the subjects of some form of abdominal disease. With regard to syphilis as an associated condition, we note that out of 87 male first-attack cases previous syphilitic infection was recorded in only 1 case, and that a case of delusional insanity, although the 87 patients included 20 cases of general paralysis. During the year 83 were discharged as recovered, giving a recovery-rate on the admissions of 32.9 per cent., 33 as relieved; 35 as not improved, and 74 died. These deaths, giving a percentage death-rate on the average number daily resident of 13.1, were due in 41 cases to cerebro-spinal diseases, including no less than 24 deaths from general paralysis; in 23 to chest diseases,

including 9 deaths from pulmonary consumption; in 5 to abdominal diseases, and in 5 to general and various diseases. No serious accident occurred during the year, and the asylum was twice visited by members of the General Lunacy Board, who left exceedingly favourable reports upon its condition and management.

VICTORIA HOSPITAL, CORK.

THE annual meeting of the Victoria Hospital for Women and Children, Cork, was held on March 13th, when the friends and subscribers met for the thirty-fourth time to hear the annual report of this very useful hospital. The past year has seen the completion of the new building. Excellent dormitories and bathrooms have been provided for the nursing staff, a spacious waiting room for the extern patients, with consulting room adjoining, and a large ward which the Hospital Committee hopes soon to see opened for patients. The much-needed improvements will not only greatly add to the comfort of those who carry on the work and of those who benefit by it, but will also materially aid its efficient administration. The total sum received for the special work amounts to £2,035, and £500 is still needed to pay for its completion. As regards the general financial condition of the hospital, the honorary treasurer reported an increase in the annual subscriptions of £124 3s. 4d. over last year, the total amount received being £2,645 8s. 11d. for the year, a debt of £72 16s. 6d. being due to the bank. The interest in the hospital, the treasurer said, was being maintained, as was shown by the more regular legacies left, which in a few years would be a very good source of income for the hospital.

QUEEN'S HOSPITAL, BIRMINGHAM.

THE annual report of the Queen's Hospital records the completion of the new hospital block, the dispensary, and the chapel. Alterations and enlargement of the out-patient department have also been completed, and a room on the top floor of the old block, previously occupied as a small ward, has been converted into an operating theatre. The total number of beds is now 170, divided into 60 medical and 110 surgical. The sum expended on the new buildings and alterations was £41,132, and towards it £26,950 have been subscribed. During the past year the number of patients treated has been 39,483, as compared with 37,898 in 1907. The expenditure has increased also from £12,786 in 1907 to £14,226 in 1908. The income, on the other hand, has decreased from £10,979 to £10,474. The subscriptions showed a slight increase, but the Hospital Sunday Fund, donations, and registration fees showed a decrease, so that the total receipts were less by £505 than those of last year. The roof ward, even in the inclement season, has been kept well filled since it was first opened. During the year, Mr. B. J. Ward has been appointed to the vacant post of third surgeon to out-patients, and Mr. F. Emrys-Jones to the new post of radiographer.

SUNDERLAND INFIRMARY.

THE report of the General Committee of Sunderland Infirmary, submitted at the annual meeting on January 28th, covered a period of eighteen months. It shows a debit balance of some £900, but additions to the out-patient department and other structural improvements, which should be passed to the balance sheet, explain the greater part of this deficit. The yearly cost per bed seems to have dropped from £53 6s. 11d. in 1907 to £48 15s. 6d. in 1908, but how this calculation is made is not shown. The staff is to be increased by four members—two assistant physicians and two assistant surgeons.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column, advertisements must be received not later than the first post on Wednesday morning.

VACANCIES.

- BANBURY: HONITON INFIRMARY.—House-Surgeon. Salary, £80 per annum.

NELSON, W. B., M.R.C.S., L.R.C.P., District and Workhouse Medical Officer of the Wainford Union.

NOYES, H. F., G. M.B., B.C.Camb., District Medical Officer of the Tarsvin Union.

O'BRIEN, John, L.R.C.P. Edin., L.R.C.S. Edin., L.F.P.Glasg., Assistant Medical Superintendent of Toowoomba Asylum, Queensland.

ROBERTSON, Monica, M.B., B.S.Durh., School Medical Inspector under the Nottingham Education Committee.

SMITH, Harold C., D.M. and S.S.A. Lond., Medical Officer of Health, Skirlough Rural District Council.

STIFF, Harold, M.B.Cantab., Surgeon to the Suffolk General Hospital, Bury St. Edmunds.

THORNBURN, J. C., M.B., Ch.B. Liverpool, Resident Assistant Medical Officer at the Brownlow Hill Workhouse Infirmary of the Liverpool Parish.

VICKERMAN, P. S., M.B., B.S. Edin., Second Resident Assistant Medical Officer, St. George's Union Infirmary.

WALKER, A. F., L.R.C.P. and S. Edin., L.F.P.S. Glasg., District Medical Officer of Toxteth Park Township.

WHITE, Clifford, M.D., B.S. Lond., M.R.C.P. Lond., Pathologist and Registrar to the Queen Charlotte's Lying-in Hospital, Marylebone Road, N.W.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 3s. 6d. which sum should be forwarded in post-office orders or stamps with the notice not later than Wednesday morning, in order to ensure insertion in the current issue.

DEATH.

RAMSBOTHAM.—March 30th, at Fairstead, Harrogate, Samuel Henry Ramsbotham, M.D. Edin., M.R.C.S. Eng., eldest son of the late John Hodgson Ramsbotham, M.D., F.R.C.S., aged 70 years.

DIARY FOR THE WEEK.

WEDNESDAY.

UNITED SERVICES MEDICAL SOCIETY, Royal Army Medical College, Millbank, S.W., 8.30 p.m.—Surgeon K. D. Bell, R.N.: Physical Training and the Medical Profession.

THURSDAY.

ROYAL SOCIETY OF MEDICINE: DERMATOLOGICAL SECTION, 20, Hanover Square, W., 5 p.m.—Exhibition of Cases.

FRIDAY.

ROYAL SOCIETY OF MEDICINE: ELECTRO-THERAPEUTICAL SECTION, 20, Hanover Square, W., 8.30 p.m.—Papers:—Dr. Sloan: Vulvo-vaginal Electricity for Ionic Medication; Dr. T. Eckenham: Treatment of Haemorrhoids by Zinc Mercury Ionization; Mr. N. S. Finzi: Treatment of Ulcers by Ionic Medication.

SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 11, Chandos Street, Cavendish Square, W., 8.30 p.m.—Papers on the Etiology of Beri-beri will be read for Dr. L. Braddon, Seremban, and Dr. A. R. Wellington, Singapore.

POST-GRADUATE COURSES AND LECTURES.

CENTRAL LONDON THROAT AND EAR HOSPITAL, Gray's Inn Road, W.C. Tuesday and Friday, 3.45, Middle Ear and Labyrinth.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.—Wednesday, 2.30 p.m., Medical Out-patient, Skin, and Eye Clinics; 5 p.m., Demonstration on the Infectious Fevers at the North-Eastern Fever Hospital, St. Anne's Road, N.E. Thursday, 2.30 p.m., Gynaecological Operations; Clinics: Medical Out-patient, Surgical Out-patient, X Rays; 5 p.m., Medical In-patient, Friday, Clinic: 10 a.m., Surgical Out-patient; 2.30 p.m., Operations; Clinics: Medical Out-patient, Eye; 3 p.m., Medical In-patient.

BOOKS, ETC., RECEIVED.

Elementary Practical Treatise on Diseases of the Pharynx and Larynx. By Dr. E. J. Moura. Translated by J. M. Farquharson. M.B., F.R.C.P. London: Reisman, Limited. 1909. 12s. 6d.

ANNUAL MEETING, BRITISH MEDICAL ASSOCIATION, BELFAST, 1909.

The Seventy-seventh Annual Meeting of the British Medical Association will be held at Belfast from July 23rd, to July 31st, 1909, under the Presidency of Sir William Whitla.

The Annual Representative Meeting commences in Belfast on July 23rd. The Presidential Address will be delivered on July 27th. The Sections will meet on July 28th, 29th, and 30th.

A preliminary programme of arrangements was published in the SUPPLEMENT, February 27th (see also March 27th, p. 145). The Honorary Local Secretaries are: Henry Lawrence McKisack, M.D., M.R.C.P., 17, University Square, Belfast; Cecil Edward Shaw, M.A., M.D., M.Ch., 29, University Square, Belfast; and Howard Stevenson, B.A., M.B., F.R.C.S.I., 2, College Square North, Belfast.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

THE British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the BRITISH MEDICAL JOURNAL is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow:

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent by the Branch Secretary to the General Secretary of the Association, and to every

Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the BRITISH MEDICAL JOURNAL for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

British Medical Association.

SCIENCE COMMITTEE.

REPORTS OF INSPECTORS ON WORK OF SCHOLARS AND GRANTEES.

THE Science Committee, at its meeting on March 26th, received reports from members of the Committee and others who had undertaken to inspect the work done by the research scholars of the British Medical Association, and by other investigators who had received grants from the Association last year. The following reports are published for the information of members of the Association.

Scholarships.

Immune Bodies in Haemolytic Serum

Dr. R. C. Buist reports:—

Dr. J. P. McGowan, Ernest Hart Memorial Scholar, has continued his work on the seat of the origin of complement, especially by the method of extirpation of organs, and has also extended his former work on the fate of hen corpuscles injected into the blood stream of the rabbit. Part of the result is being incorporated in a thesis for the M.D. degree in Edinburgh University, and owing to the regulations of the University Dr. McGowan requests the permission of the Science Committee to delay the presentation of a detailed report on his work in the meantime. I have much pleasure in supporting his application. I am satisfied that Dr. McGowan has done his work with great care and ability, and think that the Council is to be congratulated on the fact that

the fitness of his election to the Ernest Hart Scholarship has been approved by his recent selection for the post of Bacteriologist to the R.C.P.Ed.

Action of Drugs in Health and Disease.

Professor W. E. Dixon reports:—

Dr. W. H. Harvey, Research Scholar, has during the past six months been doing the most satisfactory work in the Pharmacological Laboratory, Cambridge. Some of the results will appear in the May number of *Virchow's Archiv*. Dr. Harvey, in collaboration with myself, has also published another short paper on the action of brucine. We have been working at the difference in the action of certain drugs during health and disease. For this purpose animals were first given some toxin, such as diphtheria, and a day or two afterwards when they were under the influence of the poison the action of drugs was determined. It was found that many drugs were without action under these circumstances; the action of others was greatly modified. In these cases of acute toxæmia, the greatest benefit was derived from endovenous injections of physiological saline. Dr. Harvey has also obtained some interesting conditions by the daily administration of pituitary extract. One difference between the action of pituitary extract and adrenalin is that the former drug contracts the coronary arteries whilst the latter does not. In correlation with this fact it has been determined that pituitary extract induces coronary sclerosis, a condition which I believe has not previously been induced experimentally.

Effect of Muscular Work on Purin Metabolism.

Professor C. J. Martin reports:—

Dr. E. L. Kennaway, Research Scholar, is diligently pursuing an investigation into the Effect of Muscular Work on Purin Metabolism, in the Laboratory for Pathological Chemistry at the Lister Institute of Preventive Medicine under Dr. Leathes, and the first instalment of the results obtained appeared in the *Journal of Physiology*, December 1908, Vol. 38, p. 1.

(a)

Experiments were made to ascertain whether the large excretion of uric acid, which was found by Leathes and Cathcart to follow muscular work, could be attributed to the flushing out of an amount of this substance which was present in the body and would otherwise have been retained there, or whether the increased output were due to heightened activity of the process of formation of uric acid.

During two periods of 28 and 24 days, respectively, a purin-free diet was taken at fixed times and in equal amounts daily. For the examination of the urine, the day was divided into four, and sometimes five portions, the urine passed during each of these being analysed separately.

In the first place, the same amount of work was performed with 10-lb. dumb-bells on four occasions at intervals of a few days. The first period of work was followed by a considerable increase in the output of uric acid, the second period by a smaller increase, after the third and fourth periods the output was actually subnormal. Two new forms of exercise were then taken, which brought into action muscles which had not been employed on the earlier occasions; the subsequent output of uric acid was distinctly greater than it had been after the later repetitions of the previous form of work.

The diminution in effect which was observed to result from the repetition of a single form of work might have been due to exhaustion of the stock of retained uric acid, but if this were the case, the new exercises could not have produced the observed increase in the output by any washing-out process; they must then have caused an increase in the formation of uric acid. These results suggest that unaccustomed exercise leads to the formation of increased amounts of uric acid, this effect showing, however, a progressive diminution as the muscles employed in any one form of exercise become better trained.

In the second place, the combined effects of salicylic acid and of muscular work upon the uric acid output were observed. On an earlier occasion the person who was the subject of these experiments had taken 4 grains of salicylic acid; in the next 24 hours the amount of uric acid excreted was nearly twice as great as is normal, while during the second 24 hours only about three-fifths of the normal amount was excreted. When 2 grams of salicylic acid were taken before and after 2 hours of muscular work, the uric acid output during the next 24 hours was two and one-fifths times greater than the average, while during the second 24 hours the diminution in the output was less than it had been at this time under the influence of salicylic acid alone. A comparison of the combined effects of muscular work and of salicylic acid with the results obtained by the action of each of these two agents alone indicates that the two actions can take place simultaneously without interference. This fact, and the great amount of the output under these conditions, give support to the theory that muscular work increases the formation of uric acid.

(b)

Two series of observations made upon the same person in July and October, 1908, showed that the total output of purins at these two periods was almost exactly the same, while the amounts of uric acid excreted showed a considerable difference. In both these periods the uric acid output was more variable from day to day than was that of the total purins. This result confirms the conclusion reached by Burian and Schur, that the total output of purin compounds is in any person a remarkably constant quantity, which undergoes smaller variations than does the uric acid output.

(c)

The amounts of purin base excreted during different portions of the day show variations very similar to those of the uric acid output. The excretion of bases is lowest during the night and highest about the middle of the day.

(d)

When a constant amount of fluid is being taken at fixed times of the day, the output of uric acid tends to be

raised when the volume of urine is small, and lowered when the volume of urine is large, while the excretion of purin bases varies in the opposite directions.

(e)

During muscular work, the output of purin bases is increased while that of the uric acid is diminished; the net result of these two changes is such that the total amount of purins excreted may be but little altered. This naturally suggested that the amount of oxygen supplied to the tissues during exertion is insufficient to allow of the formation by oxidation of the usual amount of uric acid. Accordingly, observations were made upon the excretion of purins during work with and without inhalation of oxygen. No definite evidence of an increased oxidation of purins could be obtained when oxygen was inhaled.

Mesencephalic Root of Trigeminal.

Professor C. J. Martin reports:—

Dr. Otto May, Research Scholar, is working in Sir Victor Horsley's Laboratory at University College on the origin and distribution of the mesencephalic root of the trigeminal nerve. There are some important groups of cells in the brain stem, the functions of which have only been conjectured, not proved. One of the most interesting of these is the column of large ovoid cells, lying along the outer border of the grey matter surrounding the aqueduct of Sylvius. They are usually regarded as part of the motor nucleus of the trigeminal nerve, and their axons are said to form the "mesencephalic" or descending root of that nerve, and to issue from the pons as part of its motor division. This view has never been put to experimental proof, and the great morphological differences between these cells and those of the main motor nucleus in the pons together with their close connection with the nuclei of the 3rd and 4th nerves, suggests the probability of some functional connection with those nerves.

The object of Dr. May's present research is a complete experimental investigation of the cells; and their axons.

The methods he is employing are of two kinds:—

1. Division of the whole or branches of the trigeminal nerve (or the oculo-motor nerves) in cats and monkeys and after a suitable interval examining the nucleus in question for chromatolytic changes.
2. Making lesions in the hind part of the mid-brain, *i.e.*, through the tegmental region in the level of the posterior part of the posterior colliculus, for the purpose of dividing the supposed mesencephalic root of the trigeminal without interfering with its main nuclei in the pons. Serial sections are made of the parts behind the lesion, stained by Marchi's method to show degenerated fibres, and of the parts in front of the lesion, stained to show chromatolysis. In addition, the Gasserian ganglion and the peripheral branches of the trigeminal and other nerves are examined for degenerated fibres.

Up to the present a large number of these various lesions have been made, of which a considerable portion have been successful. The results, so far as they have been obtained, suggest the necessity for considerable revision of our ideas regarding the function of these parts. At present, however, it would be premature to give any detailed account of these findings, but it appears likely that the completion of this research will throw considerable light on the connections of various parts of the mid-brain.

Grants.

The Larger Nuclei of the Brain Stem.

Professor C. J. Martin reports:—

Dr. Gordon Holmes is working in Sir Victor Horsley's Laboratory, University College, and is engaged in an investigation on the anatomical relations of the larger nuclei of the brain stem, especially of those which are connected

with the cerebellum. He is observing as far as possible the symptoms which arise from destruction of these nuclei. The methods he employs are: (1) making small lesions by electrolysis in the grey matter to be investigated, and tracing the myelinated fibres which degenerate therefrom by the Marchi method; (2) making larger lesions, e.g., hemisection of the mid-brain, or section of the peduncles of the cerebellum, and ascertaining later by Nissl's method those cells which send axis cylinders into the region injured by the experiment.

Owing to delay in obtaining a vivisection licence relatively little progress has been yet made.

Lymphogenous Neurotoxic Lesions.

Professor Sheridan Delépine reports:—

Dr. David Orr has worked continuously in the Pathological Laboratory of the Manchester University at this since last June. He has continued his work on *lymphogenous neurotoxic lesions*. He has compared the action of the *Bacillus paratyphicus* with that of the *Bacillus coli* and of the staphylococcus he had previously used. He has obtained distinct results which he demonstrated by means of excellent preparations.

He has also begun to investigate the character of haematoxigenous neurotoxic lesions in rabbits (3 rabbits used).

The Pituitary Body.

Professor C. J. Martin reports:—

Drs. Halliburton, Mott and Sikes are engaged at Claybury Asylum and King's College, London, in the examination of a large number of pituitary bodies removed after death from various cases of nervous disease. The work is progressing rapidly, and the authors expect that a full paper on the subject will be ready for publication soon. Most of our knowledge of the pituitary is derived from the study of that gland in animals. So far as results have at present been obtained, they coincide very closely with those derived from a study of the pituitary in animals, and the various nervous affections from which the patients suffered appear to be without any marked influence on the functions of the organ.

The investigation is partly histological, partly experimental (injection of extracts into animals), and partly chemical, an attempt being made to determine the chemical nature of the active principle.

Cyanosis in Congenital Heart Disease.

Professor C. J. Martin reports:—

Dr. Herbert French is working conjointly with Dr. Pembrey in the Physiological Laboratory at Guy's Hospital upon the nature of the extreme cyanosis of certain varieties of congenital heart disease. The methods employed are various, including gas analyses (respiratory exchanges, etc.), blood examinations, blood pressure determinations, the effects of respiring various abnormal gases, and so forth. Extensive investigations have been carried out upon four adult cases of morbus coeruleus. The results so far afford evidence in favour of certain theories, but naturally it requires a larger number of cases to be investigated before absolute statements upon any deductions can be made. Cases of adult morbus coeruleus are not so common as to enable the investigators to carry on their work continuously, and it might be several years before they have examined a sufficient number of cases. A preliminary account of the results of their work upon this subject during last year was communicated to the Section of Physiology at the Annual Meeting at Sheffield, and was published in the *BRITISH MEDICAL JOURNAL*, August 29th, 1908.

Estimation of Total Haemoglobin.

Professor C. J. Martin reports:—

Dr. A. E. Boycott and Dr. C. G. Douglas set out to attack the problem as to whether reliance could be placed on the method described by Haldane and Lorrain Smith in 1900 of estimating the total amount of haemoglobin in the body and the volume of the blood by administering carbon monoxide

in known amount, and subsequently measuring the pinkness of the blood. Very important results were obtained by L. Smith by the application of this method to cases of human anaemia. He found, for example, that in pernicious anaemia there is a real deficiency of haemoglobin in the body, and that in chlorosis, on the other hand, the deficiency of haemoglobin indicated by the haemoglobinometer is only apparent, and is brought about by a great increase in the total volume of blood. In the same way it has been shown that in *Ankylostoma* anaemia there is no real lack of haemoglobin, but only a dilution of the blood.

The accuracy of this method cannot be tested directly on man. On animals, however, by making determinations by this method before and after (1) taking out a known amount of haemoglobin by bleeding, (2) putting in a known amount by transfusion, they got the correct calculated answer within about 5 per cent. A similar correspondence was found between the results given by the carbon monoxide method and those obtained by killing the animal, washing out the vessel, etc., and so estimating the total amount of haemoglobin directly. The inference which may be drawn is that the results obtained on man are completely reliable.

They also studied the regeneration of blood by this method, and were able for the first time to determine accurately the amount of haemoglobin which is regenerated from day to day after single and repeated bleedings. The fate of rabbits' blood transfused into rabbits was also examined. They found that if an amount of haemoglobin equivalent to about one quarter to one third of that possessed by the recipient be passed into the circulation, it takes about ten days to disappear; it would then be of material service in helping to tide over the period of dangerous pregenerative deficiency of haemoglobin following a severe haemorrhage. If, however, the transfusion be repeated a second or a third time on the same animal, a similar quantity of haemoglobin is disposed of in two or three days, under which circumstances transfusion would be an almost useless therapeutic measure. This observation raises many points of interest which Boycott and Douglas are at present investigating.

Incidentally they observed in rabbits conditions somewhat resembling chlorosis in man, in that the haemoglobinometer readings indicated a much greater deficiency of haemoglobin than actually obtained owing to a co-existing increase in the volume of the blood. This condition was found in some animals after a single severe haemorrhage, in aniline poisoning (when the volume of the blood may be doubled), and in a spontaneous anaemia (in which the volume was increased fourfold).

An abstract of their results was received by the Secretary of the Association for publication in the *JOURNAL* in accordance with the terms of the Grant on November 2nd last. A more extended account will appear in the next number of the *Journal of Pathology and Bacteriology*. Financial assistance in aid of this research was also received from the Government Grant Committee of the Royal Society.

Methaemoglobin.

Professor C. J. Martin reports:—

Mr. P. P. Laidlaw is working in the Physiological Laboratory at Guy's Hospital and is re-examining the accepted view with regard to the amount of oxygen present in methaemoglobin.

He has found that oxyhaemoglobin when converted into haematin by acids gave up half its available oxygen, whereas methaemoglobin treated in the same way did not. As the haematin formed seem to be the same and the oxygen would hardly have come from the globin or the acid used it is probable that the oxygen content of oxyhaemoglobin is different from methaemoglobin. If this is the case the accepted view resting on Hüfner's researches is incorrect.

The method Mr. Laidlaw is employing for his work consists of three steps: (1) crystallization of methaemoglobin, (2) estimation of the oxygen content in pure pigment by means of hydrazine hydrate solution which gives one molecule of nitrogen for one molecule of available oxygen, (3) estimation of the amount of haemoglobin used.

The research has only recently commenced and the time has so far been occupied in devising and perfecting the methods.

(Continued on next page)

Cardio-toxins in Blood Serum and Muscle.

Professor C. J. Martin reports:—

The researches at present being carried out by Miss Winifred C. Cullis, D.Sc., at the Physiological Laboratory of the London School of Medicine for Women are:—

1. The investigation as to the nature of the substances present in blood serum, toxic to the isolated mammalian heart.
2. The isolation of the substance or substances in Liebig's extract of meat which gives to this preparation its stimulating properties upon the excised heart. These properties are being investigated in perfusion experiments upon the isolated mammalian hearts fed with Locke's solution.

The first point Miss Cullis has been investigating for some time, and so far she has determined that the poisonous substance is protein in nature, or that at least it is eliminated from the serum by methods which get rid of the proteins.

The second investigation arose from Miss Cullis's own observation that muscle extract acted as a stimulus to the perfused heart, an observation confirmed by Dr. Biggs. At present separation of the different constituents of this extract is being attempted by Kütsch's method, and these when obtained will be investigated separately.

Dropsy of Pregnancy.

Professor C. J. Martin reports:—

Dr. A. M. H. Gray is, conjointly with Dr. Charles Bolton, making "Observations on the dropsy occurring during pregnancy in rabbits," but the work, which is being carried out in the laboratories of University College Hospital Medical School, is not yet very far advanced owing to the difficulty of securing pregnant animals at this time of the year.

It was noticed by these investigators that ascites is by no means uncommon in pregnant rabbits. This is no doubt a well known fact, but no reference to it has been found in the literature.

This accumulation of fluid in the peritoneal cavity must be brought about either by an exaggerated action of the physiological mechanisms concerned in the production of lymph, or by pathological factors. In the latter case, the primary cause might be some disturbance in the circulation or some toxic condition of the blood.

Drs. Gray and Bolton propose to investigate the condition of the circulation, the blood, and the ascitic fluid of these animals, and have commenced to examine the pressures in the different parts of the vascular system.

In order to get some idea of the pressures occurring in normal rabbits they have examined the venous pressures in the jugular vein, inferior vena cava, and portal vein, and also the arterial pressure in nine normal rabbits. In each case artificial respiration was employed and the animals were anaesthetized to the same degree with ether. Up to the present time they have only had the opportunity of examining the pressures in four pregnant animals, the amounts of the ascitic fluid being on the average about 15 ccm. In these animals the various pressures were found to be precisely the same as had been found to occur in the normal animal.

If the dropsy is an exaggeration of the normal condition, or due to a disturbance of the circulation this result is of great interest, as showing that the accumulation of fluid has occurred with a normal capillary pressure, because it has been held for some time by Dr. Bolton as the result of experiments, that the dropsy of venous stagnation is not dependent upon a rise of capillary pressure.

Rickets.

Professor Noel Paton reports:—

During last summer, Dr. Leonard Findlay carried out experiments in the Pathological and Physiological Laboratories of the University of Glasgow in connection with variation in the amount of complement in rickets, but the complement proved so labile that the results proved inconclusive. This winter the investigation is being continued on kittens. The blood in eight cases of experimental rickets in dogs has been examined.

Motor and Sensory Functions of Human Alimentary Canal.

Professor C. J. Martin reports:—

The investigations of Dr. A. F. Hertz on the motor and sensory functions of the human alimentary canal in health and disease were carried out at Guy's Hospital chiefly by auscultation and by skiagraphy after the administration of a meal containing 2 ounces of bismuth oxychloride, an inert salt opaque to the X-rays.

The process of swallowing produces characteristic sounds, and its mechanism has also been studied with the X-rays. (1) (2).

In addition to peristalsis, segmentation, which thoroughly churns the food with the digestive juices, occurs in man as well as in animals (1) (2).

The residue of a meal begins to arrive in the caecum 4 hours after it is taken. The arrival can be recognised by auscultation, as it produces characteristic sounds which disappear when the opening of the ileo-caecal sphincter is inhibited by inflammation in its immediate neighbourhood. The presence or absence of caecal sounds can be a valuable aid in the diagnosis of appendicitis and certain other conditions. (5).

The study of a large number of cases of constipation has shown that two great classes exist: (1) those due to sluggish action of the intestines, especially the part distal to the middle of the transverse colon, owing to weakness of the intestinal musculature, insufficient stimulation of peristalsis or depression of the nervous system; (2) those due to inability to defaecate completely owing to weakness of the abdominal muscles, or loss of the defaecation reflex, the passage through the intestines being normal in rate. (3) (4).

According to Hertz's results saline purgatives do not act by attracting water into the lumen of the gut, but by stimulating the motor and secretory activity of the large intestine after absorption into the blood. (6).

Dr. Hertz has also made observations upon the sensory capacity of the normal alimentary tube. The stomach and intestines are insensitive to heat and cold; the temperature sensation felt on swallowing is produced in the lower end of the oesophagus.

0.5 per cent. HCl produces no sensation in the oesophagus or stomach, so heartburn and the pain in "hyperchlorhydria" cannot be due to excess of HCl alone. Carminatives produce no sensation, but 40 per cent. alcohol produces a characteristic "burning" in the oesophagus and the stomach. (7).

Physiological Effect of Gastro-jejunostomy.

Professor C. J. Martin reports:—

Mr. Herbert J. Paterson, M.A., F.R.C.S., is working at the Laboratory of the London Temperance Hospital, and also in a small subsidiary laboratory fitted up at his residence. He is continuing his investigations into the physiological effects of the operation of gastro-jejunostomy by investigating the condition of the stomach contents before and after operation on patients on whom he himself operates. He has the patient under observation during the whole period of the investigation.

Mr. Paterson has already investigated some 30 or 40 cases. He proposes to make additional observations upon a number of the cases a year or more after operation to ascertain what influence time has on the changes produced by operation.

Intestinal Concretions.

Professor Sheridan Delc pne reports:—

Dr. Owen T. Williams has been engaged since last June in collecting intestinal concretions, healthy and diseased appendices vermiformes, etc.

He has also studied the characters of neutral fats and earthy soaps, and their distribution in the mucous membrane of the intestine and in concretions. He proposes to use animals, including a goat, for experimental work.

Dr. Williams has already done a considerable amount of work which appears to be very carefully done and sound.

He works in Professor B. Moore's Laboratory in the University of Liverpool.

Metabolism in Rheumatoid Arthritis.

Professor W. E. Dixon reports:—

Dr. Harold Ackroyd has been working at the Hospital for Special Diseases, Cambridge, at purin metabolism, to which he has been devoting his whole time. He is about to publish a paper on the metabolism of rheumatoid arthritic patients. These patients were required to live on a purin-free diet for a time varying from three to four weeks, during which period their endogenous uric acid nitrogen, etc., was examined daily. The work has been performed under exceptionally favourable conditions in the special hospital for rheumatoid arthritis.

The following are the conclusions at which he has arrived:—

1. The normal endogenous excretion of uric acid nitrogen may fluctuate from day to day in the same individual to the extent of 0.037 gram (0.11 gram of uric acid), and the total purin nitrogen excretion to the extent of 0.03 gram.

2. The daily average endogenous uric acid nitrogen excretion varies in different individuals from about 0.08 to 0.19 gram (0.25 to 0.55 gram of uric acid), and the total purin nitrogen from about 0.1 to 0.21 gram.

3. No constant percentage of a purin substance contained in the food reappears in the urine as exogenous purin excretion. This percentage may vary in normal cases from 20.6 to 71.5 when hypoxanthin is the purin substance administered; and the same individual may give different results on different occasions.

4. The duration of the period of increased uric acid excretion which follows the addition of 0.75 gram of hypoxanthin to a purin-free diet may be as short as two days, or as long as four in normal cases.

5. There is no important change in the purin metabolism of persons suffering from rheumatoid arthritis; it may be (1) completely normal, or (2) while normal as regards the endogenous excretion, the period of increased uric acid excretion which follows the administration of hypoxanthin may be prolonged for more than four days. It is more likely that this effect is individual than that it is characteristic of any particular form of the disease, except in those cases in which this prolongation is accompanied by active manifestations of the disease.

6. An acute or sub-acute attack of rheumatoid arthritis is accompanied by an increased purin excretion in some cases, but not in all.

7. Hypoxanthin, though generally inert except as regards its effect on purin excretion, may cause slight rise of temperature in some persons, while in other persons headache occurs some hours after it has been taken. These effects are neither frequent nor generally very well marked.

8. Some evidence is brought forward that, at any rate in some cases of rheumatoid arthritis, part of the increased excretion of uric acid which follows a dose of hypoxanthin may not be derived by direct oxidation from that substance, but may be the result of its action on the endogenous purin metabolism.

Opsonic Index in Coryza.

Professor C. J. Martin reports:—

Dr. C. H. Benham has been engaged in determining the opsonic index of the blood of persons infected by the organisms producing common colds, noting the results of vaccine therapy on the opsonic index to see whether any clinical results might be obtained which would be of value in treatment.

Dr. Benham has taken advantage of an epidemic of rather severe colds for investigation. The prevailing organism has been the *Micrococcus catarrhalis*, associated in several cases with *Micrococcus paratyphicus*. He has made observations upon six cases due to the *Micrococcus catarrhalis*.

Dr. Benham observed in all but one of the six cases a considerable rise in the opsonic index as a result of the injection of a vaccine prepared from the *Micrococcus catarrhalis*, and this was accompanied by an improvement in clinical symptoms. One case, in which an injection of 250 million organisms was given within 24 hours of the onset, was completely cured in 48 hours, the opsonic index rising from 0.63 before injection to a maximum of 2.27.

It is too early at present to draw any conclusions as to the results, but they appear to confirm those obtained by R. W. Allen (*Lancet*, December 5th, 1908).

Intracellular Constituents of Micro-organisms.

Professor C. J. Martin reports:—

Professor R. Tanner Hewlett, King's College, London, is investigating the properties of the intracellular constituents (endotoxins) of micro-organisms, particularly those which do not excrete toxin.

The intracellular constituents are obtained by a modification of MacFadyen's method (trituration in the presence of liquid air).

At present the effects of the intracellular constituents of the *Micrococcus pyogenes* var. *aureus* are being studied especially in relation to their effects on the opsonic index of normal animals.

The keeping qualities of the solutions of the intracellular constituents are also being investigated with a view to the possibility of their use for prophylaxis and treatment.

It has been found that the constituents of the *M. pyogenes* var. *aureus* produce when injected subcutaneously a marked rise in the opsonic index of rabbits, a rise greater and more lasting than that produced by a vaccine (a killed culture) of the same micro-organism. Weight for weight, the endotoxin is decidedly more active than the corresponding vaccine. Taken by the mouth, also, a distinct, though transient, rise of the opsonic index is obtained.

The solutions of the endotoxins with which these results have been obtained are being kept, and will be tested from time to time in order to ascertain their keeping qualities.

An important point which is indicated by the work so far accomplished, is that the endotoxins, even in large doses, produce decidedly less "negative phase" than the corresponding vaccine.

In these experiments the opsonic index is being determined for several strains of the *M. pyogenes* var. *aureus*, and indications have been obtained that there is some variation with the different strains, suggesting that the strain of organism employed in determinations of the opsonic index may be a factor of some importance.

Parasitic Skin Diseases.

Dr. R. C. Buist reports:—

Dr. R. Cranston Low is continuing with great patience his experiments on the growth of tinea *in vitro* and in animals. The rate of growth is extremely slow, but a strain has been successfully inoculated in the cat, and Dr. Low has also prepared a vaccine and has at present three cats under treatment with it. It will for some time yet be impossible to report the result. Dr. Low made an interesting exhibit of his cultures at the recent meeting of the Edinburgh Branch.

Scabies has been successfully cultivated in the rabbit, and at the same meeting a series of microscopic sections was exhibited. In the rat the results have so far been negative. Dr. Low's work is being very well done.

Röntgen Rays.

Professor C. J. Martin reports:—

Dr. A. Howard Pirie is investigating the quantitative relations between X-rays given off and the amount of electricity used. For this purpose it is necessary to measure the voltage, the milliampère, and the time. The latter two can be combined in the quantimeter brought out by Dr. Pirie two years ago. It is still difficult to measure the voltage, as a suitable instrument has not yet been brought out. The Equivalent Spark Gap is taken as a measure of the voltage, but it is only a rough gauge. Lord Kelvin's instrument has been found unsuitable for use with an X-ray outfit.

Dr. Pirie has carried out many experiments with various X-ray tubes, and found that an X-ray tube which is suitable for use in a case of Ringworm requires to be supplied with about $\frac{1}{300}$ of a Board of Trade unit at 63,000 volts before the skin has received enough X-rays to cause epilation according to Sabouraud's method.

THE SEVENTY-SEVENTH ANNUAL MEETING
OF THE
BRITISH MEDICAL ASSOCIATION,
BELFAST,
JULY 23RD TO JULY 31ST, 1909.

President:

SIMON SNELL, Hon.D.Sc., F.R.C.S.Edin., Ophthalmic Surgeon, Royal Infirmary, Sheffield.

President-elect:

Sir WILLIAM WHITLA, M.D., LL.D., Professor of Materia Medica and Therapeutics, Queen's College, Belfast.

Past-President:

HENRY DAVY, Hon.D.Sc., M.D., F.R.C.P.Lond., Physician, Royal Devon and Exeter Hospital, Exeter.

Chairman of Representative Meetings:

JAMES ALEXANDER MACDONALD, M.D., M.Ch., R.U.I., Physician, Taunton and Somerset Hospital.

Chairman of Council:

EDMUND OWEN, Hon.D.Sc., LL.D., F.R.C.S., Consulting Surgeon to St. Mary's Hospital, London.

Treasurer:

EDWIN RAYNER, M.D.Lond., F.R.C.S., Consulting Surgeon, Stockport Infirmary, Stockport.

The Seventy-seventh Annual Meeting of the British Medical Association will be held in Belfast in July, 1909. The President's address will be delivered on Tuesday, July 27th, and the Sections will meet on the three following days. The Annual Representative Meeting will begin on Friday, July 23rd, 1909.

PROGRAMME OF BUSINESS.

The Address in Surgery will be delivered by ARTHUR EDWARD JAMES BARKER, F.R.C.S., Professor of the Principle and Practice of Surgery, University College, London.

The Address in Obstetrics will be delivered by Sir JOHN W. BYERS, M.D., Professor of Midwifery and Diseases of Women, Queen's College, Belfast.

The Popular Lecture will be delivered by Dr. J. A. MACDONALD, Physician to the Taunton and Somerset Hospital, Chairman of the Representative Meetings.

THE SECTIONS.

The scientific business of the meeting will be conducted in fifteen Sections, which will meet on Wednesday, July 28th, Thursday, July 29th, and Friday, July 30th.

The President, Vice-Presidents, and Honorary Secretaries of each Section constitute a Committee of Reference for that Section, and exercise the power of inviting, accepting, or declining any paper, and of arranging the order in which accepted papers shall be read. Communications with respect to papers should be addressed to one of the Honorary Secretaries.

A paper read in the Section must not exceed fifteen minutes, and no subsequent speech must exceed ten minutes.

Papers read are the property of the British Medical Association, and cannot be published elsewhere than in the BRITISH MEDICAL JOURNAL without special permission.

The following are the general arrangements so far as they are yet complete:

ANATOMY AND PHYSIOLOGY.

President: CHARLES SCOTT SHERRINGTON, M.D., F.R.S., Physiological Laboratory, University, Liverpool.

Vice-Presidents: Professor THOMAS HUGH MILROY, M.D., F.R.S.E., Queen's College, Belfast; Professor PETER THOMPSON, M.D., King's College, Strand, London; ARTHUR

PHILIP BEDDARD, M.D., F.R.C.P., 44, Seymour Street, Portman Square, London, W.; Professor ANDREW FRANCIS DIXON, M.B., D.Sc., 73, Grosvenor Road, Dublin.

Honorary Secretaries: ALEX. LOW, M.B., 142, Blenheim Place, Aberdeen; JOHN ALEX. MILROY, M.D., Queen's College, Belfast.

DERMATOLOGY AND ELECTRO-THERAPEUTICS.

President: WILLIAM CALWELL, M.D., 6, College Gardens, Belfast.

Vice-Presidents: ROBERT BRIGGS WILD, M.D., 96, Mosley Street, Manchester; LESLIE ROBERTS, M.D., 46, Rodney Street, Liverpool.

Honorary Secretaries: JAMES HARRY SEQUEIRA, M.D., F.R.C.P., 8a, Manchester Square, London; S. ERNEST DORE, M.D., 26, New Cavendish Street, London; JOHN CAMPELL RANKIN, M.D., 38, University Road, Belfast.

A discussion will be held on the Treatment of Skin Diseases by Radium and Radio-therapy.

DISEASES OF CHILDREN.

President: HAROLD J. STILES, F.R.C.S.Edin., 9, Great Stuart Street, Edinburgh.

Vice-Presidents: JOHN McCaw, M.D., 74, Dublin Road, Belfast; RICHARD WHYTOCK LESLIE, M.D., "St. Heliers,"

Strandtown, Belfast; ROBERT CAMPBELL, F.R.C.S. 21, Great Victoria Street, Belfast.

Honorary Secretaries: ANDREW FULLERTON, F.R.C.S.I., 8, University Square, Belfast; JOHN WILLIAM SIMPSON, M.D., 19, Lansdowne Crescent, Edinburgh.

It is proposed to devote some portion of three of the days on which the Section meets to the discussion of the following subjects:

Wednesday, July 28th.—Club Foot.

Thursday, July 29th.—Functional Neuroses in Children.

HAEMATOLOGY AND VACCINE THERAPY.

President: SIR ALMROTH WRIGHT, M.D., F.R.S., 6, Park Crescent, Regent's Park, London, N.W.

Vice-Presidents: ALEX. GARDNER ROBE, M.B., 15, University Square, Belfast; THOMAS HOUSTON, M.D., 95, Great Victoria Street, Belfast; CAPTAIN STEWART RANKIN DOUGLAS, I.M.S., Inoculation Department, St. Mary's Hospital, London.

Honorary Secretaries: WILLIAM DUNLOP DONNAN, M.D., 12, High Street, Holywood, co. Down; DUDLEY W. CARMALT-JONES, M.B., B.Ch.Oxon., 78, Wimpole Street, London, W.

The subjects which have been chosen for discussion are:

Wednesday, July 28th.—Papers on separate subjects: Dr. Houston, Typhoid Carriers. Captain Douglas, Bacteriology of Cystitis; discussion. Dr. Fleming, Bacteriology and Vaccine Treatment of Acne.

Thursday, July 29th.—Discussion: The Early Diagnosis of Tuberculosis, opened by Professor Calmette, l'Institut Pasteur de Lille.

Friday, July 30th.—Discussion: Bacterial Infections of the Respiratory Tract other than Tuberculous.

HYGIENE AND PUBLIC HEALTH.

President: LOUIS COLTMAN PARKES, M.D., 61, Cadogan Square, Chelsea, London.

Vice-Presidents: SAMUEL AGNEW, M.D., Lurgan, co. Antrim; HENRY O'NEILL, M.D., 6, College Square East, Belfast; CHARLES KILLICK MILLARD, M.D., Town Hall, Leicester.

Honorary Secretaries: CHARLES PORTER, M.D., Public Health Department, Town Hall, Finsbury; WILLIAM MCLEORINAN, L.R.C.P., 103, Antrim Road, Belfast; THOMAS CARNWATH, M.B., Town Hall, Manchester.

The following subjects have been suggested for discussion:

1. The Compulsory Notification of all forms of Tuberculosis and the Mortality from Tuberculous Diseases in relation to Sex. To be opened by Dr. Harold Scurfield, Medical Officer of Health, Sheffield.

2. Latent Infections of the Diphtheria Bacillus, and the Administrative Measures required for dealing with Contacts. (Joint discussion with the Laryngological Section.)

3. The Discharge of Sewage Effluents into Tidal Waters.

The following additional subjects are also suggested:

1. Enteric Fever Carriers and Paratyphoid Bacilli.
2. Ventilation of Sewers and House Drains and the Disconnexion Trap.
3. The Medical Officer of Health and School Medical Inspection.

LARYNGOLOGY, OTOTOLOGY, AND RHINOLOGY.

President: ST. CLAIR THOMSON, M.D., F.R.C.P., 28, Queen Anne Street, London.

Vice-Presidents: ERNEST BLECHYNDEN WAGGETT, M.B., 45, Upper Brook Street, London, W.; V. P. HENRY SMURTHWAITE, M.D., 8, St. Mary's Place, Newcastle-on-Tyne; J. A. KNOWLES RENSHAW, M.D., 11, St. John Street, Manchester.

Honorary Secretaries: HAROLD SHUTTLEWORTH BAREWELL, F.R.C.S., 55, Wimpole Street, London; JOHN STODDART BARR, M.B., 13, Woodside Place, Glasgow; HENRY HANNA, M.B., B.Sc., 57, University Road, Belfast.

The following subjects have been selected for special discussion:

Wednesday, July 28th.—The Treatment of Tinnitus Aurium. (1) Dr. Thomas Barr (Glasgow); (2) Mr. Richard Lake (London).

Thursday, July 29th.—Latent Infections of the Diphtheria Bacillus, including the Administrative Measures required for dealing with Contacts. (In association with the Section of Hygiene and Public Health.) (1) Dr. Robert M. Buchanan (Glasgow); (2) Dr. Duncan Forbes (Brighton); (3) Dr. P. Watson Williams (Bristol).

Friday, July 30th.—The Treatment of Cicatricial Stenoses of the Larynx and Trachea. (1) Dr. H. Lambert Lack (London); (2) Dr. Delsaux (Brussels); (3) Dr. Bryson Delavan (New York).

It is proposed this year to arrange a special exhibition of skiagraphy in relation to diseases of the upper air and food passages. Members are requested to send in the titles and descriptions of any skiagraphs they propose to contribute to Dr. Hanna not later than June 1st, so that they may be printed in the catalogue. Every care will be taken of negatives and prints, which should be carefully labelled with the owner's name and address.

MEDICINE.

President: PROFESSOR JAMES ALEXANDER LINDSAY, M.D., F.R.C.P., 3, Queen's Elms, Belfast.

Vice-Presidents: ARTHUR FOXWELL, M.D., F.R.C.P., 47, Newhall Street, Birmingham; JOSEPH FRANCIS O'CARROLL, M.D., F.R.C.P.I., 43, Merrion Square, Dublin; LAURISTON ELGIE SHAW, M.D., F.R.C.P., 64, Harley Street, London; WILLIAM BAIRD MCQUITTY, M.D., 8, College Square East, Belfast.

Honorary Secretaries: JOHN SMYTH MORROW, M.D., Eia House, Antrim Road, Belfast; LEWIS ALBERT SMITH, M.D., 25, Queen Anne Street, London, W.; JOHN ELDER MACILWAINE, M.D., 55, University Road, Belfast.

The following subjects are suggested for discussion:

Wednesday, July 28th.—Metabolism.

Thursday, July 29th.—The Medical Aspects of Athleticism; Adolescent Albuminuria, or Mucous Colitis.

Friday, July 30th.—A Demonstration on Gastric Illumination.

NAVY, ARMY, AND AMBULANCE.

President: Fleet Surgeon J. LLOYD THOMAS, R.N.

Vice-Presidents: Inspector-General ROBERT BENTHAM, R.N. (retired), 22, King's Avenue, Ealing, London, W.; Lieut.-Colonel R. PORTER, R.A.M.C., P.M.O., Station Hospital, Military Barracks, Belfast; Colonel THOMAS H. HENDLEY, I.M.S., C.I.E., 4, Loudon Road, London, N.W.

Honorary Secretaries: Captain M. LOWSLEY R.A.M.C., St. Michael's Road, Aldershot; Captain HERBERT HUGH BLAIR CUNNINGHAM, M.D., F.R.C.S., 69, University Road, Belfast; Surgeon EDMUND COX, M.B., R.N., The Royal Naval Hospital, Chatham; Captain WILLIAM SALISBURY-SHARPE, R.A.M.C., 8, Cleveland Terrace, Hyde Park, London, W.

The Committee of this Section suggest the following subjects:

1. Effect on Health of Service in Submarine Boats.
2. Conditions of Life in Boys' Training Establishments on Shore.
3. Medical Arrangements for War in Ships of Dreadnought type.
4. A Detailed Scheme for an Unexpected Landing Party, using Material available on Board Ship.
5. Pitfalls for the Recruiting Medical Officer.
6. Probable Effects in the Services of the New Treatment of Syphilis by means of Organic Arsenical Compounds.
7. On the Importance of the Permanent Attachment of Ample Transport under the Command of the Medical Officer to each Field Medical Unit.
8. The Infective Pneumonias, their Incidence, Causes, Prevention, and Treatment during a Campaign.
9. On the Existing Ambulance Organization of the Home Railway Companies, with Suggestions for its Amplification and Unification.

10. The Effects of Recent Research on the Work of Colonial Medical Officers.

11. Diagnosis and Treatment of Pulmonary Tuberculosis in the Services.

12. Collection and Disposal of Wounded in War.

OBSTETRICS AND GYNAECOLOGY.

President: JOHN CAMPELL, M.D., F.R.C.S., Crescent House, University Road, Belfast.

Vice-Presidents: ROBERT ALEXANDER GIBBONS, M.D., 29, Cadogan Place, London; JOHN SINGLETON DARLING, M.B., High Street, Lurgan; CHARLES EDWIN PURSLOW, M.D., 192, Broad Street, Birmingham; EWEN JOHN MACLEAN, M.D., 12, Park Place, Cardiff.

Honorary Secretaries: HENRY THOMAS HICKS, F.R.C.S., Derby; ROBERT JAMES JOHNSTONE, M.B., F.R.C.S., 14, University Square, Belfast.

The Committee have thought it well to select two chief subjects for discussion:

1. The Treatment of the Graver Forms of Puerperal Sepsis.
2. Endometritis.

In the Pathological Part of this Section, Cancer of the Uterus has been chosen as one affording a wide scope for the exhibition of Specimens, Photographs, Microscopic Slides, etc.

These, with any others of interest, will be exhibited in the Pathological Museum.

OPHTHALMOLOGY.

President: JOHN WALTON BROWNE, M.D., 10, College Square North, Belfast.

Vice-Presidents: ARTHUR W. SANDFORD, M.D., 13, St. Patrick's Place, Cork; WILLIAM MARCUS KILLEN, M.D., 9, Clifton Street, Belfast; ALEX. HILL GRIFFITH, M.D., 17, St. John Street, Manchester.

Honorary Secretaries: JAMES ANDREW CRAIG, F.R.C.S., 11, University Square, Belfast; LESLIE JOHNSTON PATON, F.R.C.S., 1, Spanish Place, Manchester Square, London.

The subjects chosen for discussion are:

1. Eye Injuries in their Relation to the Workmen's Compensation Act.
2. Vascular Diseases of the Retina.
3. The Diseases of the Lymphoid Tissue of the Conjunctiva (Mr. Treacher Collins).

PATHOLOGY.

President: Professor WM. ST. CLAIR SYMMERS, M.B., Queen's College, Belfast.

Vice-Presidents: WALTER SYDNEY LAZARUS-BARLOW, M.D., Cancer Research Laboratory, Middlesex Hospital, London; ARTHUR EDWARD MOORE, M.B., Castlemahon, Blackrock, Cork; ASTLEY VAVASOUR CLARKE, M.D., 37, London Road, Leicester; Professor I. WALKER HALL, M.D., 9, Royal Park, Clifton, Bristol.

Honorary Secretaries: ALFRED EDWARD BARNES, M.B., 348, Glossop Road, Sheffield; OTTO F. F. GRÜNBAUM, M.D., 34, Wimpole Street, London, W.; WILLIAM JAMES WILSON, M.D., Pathological Laboratory, Queen's College, Belfast.

PHARMACOLOGY AND THERAPEUTICS.

President: Professor RALPH STOCKMAN, M.D., F.R.S. Edin., The University, Glasgow.

Vice-Presidents: Professor WALTER ERNEST DIXON, M.D., Pharmacological Laboratory, Cambridge; NEWMAN NEILD, M.D., 9, Richmond Hill, Clifton, Bristol.

Honorary Secretaries: VICTOR GEORGE LEOPOLD FIELDEN, M.B., 84, Dublin Road, Belfast; HECTOR CHARLES CAMERON, M.B., Guy's Hospital, London, S.E.

The following subjects have been suggested for discussion:

1. Spinal Anaesthesia.
2. The Treatment of Oedema.

PSYCHOLOGICAL MEDICINE.

President: T. OUTTERRSON WOOD, M.D., 40, Margaret Street, Cavendish Square, London.

Vice-Presidents: GEORGE ROBERT LAWLESS, F.R.C.S.I., District Asylum, Armagh; WM. RICHARD DAWSON, M.D., Farnham House, Finglas, co. Dublin; ROBERT HENRY COLE, M.D., 25, Upper Berkeley Street, London, W.; MICHAEL JAMES NOLAN, L.R.C.P. and S.I., Down District Asylum, Downpatrick.

Honorary Secretaries: WALTER SAMUEL SMYTH, M.B., District Asylum, Antrim; SIDNEY HERBERT CLARKE, M.B., Leicester and Rutland Asylum, Narborough, Leicestershire.

The following subjects have been selected for special discussion in this Section:

- July 28th.—(1) Somatic Delusions and Local Lesions. To be opened by Chas. Arthur Mercier, M.D.
- July 29th.—(2) The Sociological Relations of Insanity in Ireland. To be opened by M. James Nolan, M.D.
- July 30th.—(3) Considerations upon the Commissioner's Report of the Care and Control of the Feeble-minded. To be opened by Wm. Richard Dawson, M.D.

SURGERY.

President: Professor THOMAS SINCLAIR, M.D., F.R.C.S., 22, University Square, Belfast.

Vice-Presidents: CHARLES ALFRED BALLANCE, M.V.O., M.S., F.R.C.S., 106, Harley Street, W.; Sir PETER O'CONNELL, M.D., 9, College Square North, Belfast; ARTHUR JOHN DREW, F.R.C.S., Water Hall, St. Aldate's, Oxford; JOHN GALWAY COOKE, M.B., City and County Infirmary, Londonderry; ARTHUR BROWNLOW MITCHELL, F.R.C.S.I., 18, University Square, Belfast.

Honorary Secretaries: W. THELWALL THOMAS, F.R.C.S., 84, Rodney Street, Liverpool; G. LENTHAL CHEATLE, C.B., F.R.C.S., 117, Harley Street, London; HOWARD STEVENSON, M.B., F.R.C.S.I., 2, College Square North, Belfast; JAS. BERNARD MOORE, M.B., 11, Clifton Street, Belfast.

TROPICAL MEDICINE.

President: CHARLES WILBERFORCE DANIELS, M.B., London School of Tropical Medicine, Albert Docks, London.

Vice-Presidents: Lieutenant-Colonel ANDREW DEANE, I.M.S., Royal Victoria Hospital, Belfast; Surgeon-General W. R. BROWNE, M.D., C.I.E., 5, Royal Crescent, Holland Park Avenue, London.

Honorary Secretaries: JAMES COLVILLE, M.D., 7, University Square, Belfast; Dr. ANTON BREINL, Director Runcorn Research Laboratories.

The following subjects have been selected for discussion:

Wednesday, July 28th, 10 a.m.—Persistence of the Tropical Diseases of Man due to Protozoa. The discussion will be opened by the President.

Thursday, July 29th, 10 a.m.—Treatment of Chronic Recurrent Dysentery, with Special Reference to the Possibilities of Surgical Treatment. The discussion will be opened by Mr. J. Cantlie.

Friday, July 30th, 10 a.m.—Feeding and Treatment of Children in the Tropics. The discussion will be opened by Dr. W. Carnegie Brown.

The Committee will be glad to receive pathological specimens, photographs, drawings, or microscopical preparations illustrative of any subject in Tropical Medicine.

Honorary Local Secretaries—

HENRY LAWRENCE MCKISACK, M.D., M.R.C.P.,
17, University Square, Belfast.

CECIL EDWARD SHAW, M.A., M.D., M.Ch.,
29, University Square, Belfast.

HOWARD STEVENSON, B.A., M.B., F.R.C.S.I.,
2, College Square North, Belfast.

PROVISIONAL TIME TABLE.

FRIDAY, JULY 23RD, 1909.

11 A.M.—Annual General Meeting followed by Representative Meeting.

SATURDAY, JULY 24TH, 1909.

9.30 A.M.—Representative Meeting.

MONDAY, JULY 26TH, 1909.

10 A.M.—Representative Meeting.

7.30 P.M.—Annual Conference of Secretaries of Divisions and Branches.

TUESDAY, JULY 27TH, 1909.

10 A.M.—Council Meeting.

10.30 A.M.—Representative Meeting (if required).

2.30 P.M.—Adjourned General Meeting.
Induction of President.

8.30 P.M.—President's Address.

WEDNESDAY, JULY 28TH, 1909.

9.30 A.M.—Council Meeting.

10 A.M.—Sectional Meetings.

10.30 A.M.—Representative Meeting (if required).

12.30 P.M.—Address in Medicine.

8.30 P.M.—Reception.

THURSDAY, JULY 29TH, 1909.

8 A.M.—National Temperance League Breakfast.

9.30 A.M.—Council Meeting.

10 A.M.—Sectional Meetings.

12.30 P.M.—Address in Surgery.

7.30 P.M.—Annual Dinner.

FRIDAY, JULY 30TH, 1909.

10 A.M.—Sectional Meetings.

12.30 P.M.—Address in Obstetrics.

8 P.M.—Popular Lecture.

8.30 P.M.—Reception.

SATURDAY, JULY 31ST, 1909.

Excursions.

THE PATHOLOGICAL MUSEUM.

The following Committee has been appointed to organize the pathological museum:

President: Professor W. ST. CLAIR SYMMERS.

Honorary Secretaries: THOMAS HOUSTON, M.D.;
W. J. WILSON, M.D.

J. S. DICKIE, M.B.	C. H. P. D. GRAVES, M.D.
ROWLAND HILL, M.B.	(Cookstown).
C. G. LOWRY, M.D.	Professor McWEENEY (Dublin).
J. E. MACILWAINE, M.D.	Professor MOORE (Cork).
JOHN McLEISH, M.B.	C. H. NESBITT, M.D. (Randals-
W. J. MAGUIRE, M.D.	town).
J. C. RANKIN, M.D.	Professor O'SULLIVAN (Dublin).
FRED. SMYTH, M.D.	R. T. ROWLETTE, M.D. (Dublin).
ERNEST WALES, M.D.	Professor WHITE (Dublin).
J. SINGLETON DARLING, M.D.	JOHN WILSON, M.D. (Castle
(Lurgan).	blaney).

EX-OFFICIO MEMBERS.

The President-elect: Sir WILLIAM WHITLA, M.D., LL.D.
The Local Honorary Treasurer: JOSEPH NELSON, M.D.
The Local Honorary Secretaries: H. L. McKISACK, M.D.; C. E. SHAW, M.D.; HOWARD STEVENSON, F.R.C.S.I.

The Committee propose that the material should be arranged under the following heads:

- I. Exhibits bearing on discussions and papers in the various sections.
- II. Specimens and illustrations relating to any research work.
- III. Instruments relating to clinical diagnosis and pathological investigation.
- IV. Individual specimens of special interest, or a series illustrating some special subject.

It is also proposed to make a special effort to gather together a series of exhibits relating to:

- (a) Tuberculosis.
- (b) Diseases of warm climates.
- (c) Cancer of the uterus.
- (d) X-rays and photography.

The Committee wish it to be understood that the above are only suggestions, and if there is any subject in which Members are specially interested, and of which interesting specimens can be supplied, they will be glad to hear from them.

The Museum will occupy a central position, and will be easy of access.

It is hoped that it will be possible for arrangements to be made whereby exhibitors may have an opportunity of demonstrating their specimens.

THOMAS HOUSTON,
W. J. WILSON,
Honorary Secretaries.

Communications should be addressed to one of the Honorary Secretaries at Queen's University, Belfast.

RECREATIONS.

Golf Competition.—The Ulster Medical Society has arranged to present to the British Medical Association a cup, to be known as the "Belfast Cup," to be played for at annual meetings, and to be won out and out by any member winning it three times. It will be played for on the Friday of the Belfast meeting, on the fine links of the County Down Club at Newcastle, co. Down, kindly lent for the day by the council and members of the club. The play will be by bogey score. The cup is designed after the famous Ardagh Cup, one of the finest examples of ancient Irish work, which is now in the Kildare Street Museum in Dublin. The original is composed of gold, silver, enamels, and jewels, and was, it is believed, meant for use as a chalice. The challenge cup will be of silver, about 9 in. high, with gilt panels and coloured enamel bosses; round it will be set stones representing the four Provinces of Ireland—the black pebble for Leinster, the white or Carn-money pebble for Ulster, the red stone for Munster, and the green Connemara marble for Connaught.

Cricket Match.—The North of Ireland Cricket Club, the premier club of Ulster, and one of the best in Ireland, has kindly offered to play a one-day match against a British Medical Association team. The beautifully turfied grounds of the club are only about five minutes' walk from Queen's College, where the Association will meet. The local executive will be very glad if some English cricketer will undertake to organize a team for the occasion; any one interested in the matter should communicate with one of the Honorary Local Secretaries.

Launch.—The local executive has some reason to hope that there may be an opportunity during the annual meeting of witnessing the launch of one of the great steamships for which the shipyards of the city of Belfast are famous. A large vessel for the Orient Line is at present on the stocks in Messrs. Workman, Clark, and Co.'s yard, and is expected to be launched in July. The exact date cannot be settled so far ahead, but if the firm can make it coincide with the visit of the Association to Belfast, it has courteously promised to do so.

Meetings of Branches & Divisions.

The proceedings of the Divisions and Branches of the Association relating to Scientific and Clinical Medicine, when reported by the Honorary Secretaries, are published in the body of the JOURNAL.]

BOMBAY BRANCH.

A MEETING of the members of this Branch was held in the University Library on Thursday, March 4th, at 5.30 p.m. Dr. SORAB NARIMAN presiding. The following were also present: Drs. (Miss) Benson, Dorabhai Patel, H. N. Anklesaria, Sorab Engineer, V. J. Sangziri, and a visitor. and the Honorary Secretary, Dr. Bardi.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Subordinate Indian Medical Service and the Association.—In connexion with the letter from the Organization Committee requesting the opinion of the Branch as to the advisability of appointing some of the members of the Subordinate Indian Medical Service as complimentary members, it was resolved, as advised by the Council:

That those of the Subordinate Indian Medical Service who have attained the honorary rank of a captain may be elected complimentary members of the Branch, and that the consideration of other members be postponed to a future date.

Balance Sheet.—The balance sheet for the year 1908 was put on the table for the information of the members.

Appointment of Representative at Representative Meeting.—Captain E. F. GORDON-TRUCKER, I.M.S., was unanimously appointed the Representative of the Branch to the Representative Meetings for the year 1909-10.

Representative on Central Council.—The Honorary Secretary was authorized to communicate with the other Branches bracketed with the Bombay Branch re the appointment of a member to the Central Council; and if it could be arranged to appoint Lieutenant-Colonel H. Herbert, I.M.S. (ret.) of Nottingham, the latter should be communicated with the desire of the Branch.

Relation of Syphilis to Phthisis Pulmonalis.—Dr. SORAB K. ENGINEER, in a paper on this subject, said that opinions of authorities varied very much, and he held that more evidence was needed, and related two cases which had been under his treatment in private practice:

CASE I.—A Hindu clerk, aged 30, first came under observation on December 24th, 1907, for an eruption. His parents died of plague. He had one brother alive and in good health; he had no children. He gave a distinct history of chancre, and the eruption was diagnosed to be secondaries. This diagnosis was verified by another medical man at the same time. The eruption disappeared under the ordinary antisyphilitic treatment, local and internal. As I was reading the literature on the subject at that time, I carefully examined all his systems, and nothing worth mentioning was found. He went to his native country in Gujarat for a change, and returned to say in his own words, "Completely cured." He was advised to continue the treatment, but followed it out very irregularly nine months. In the middle of September, 1908, he consulted me for a bronchial catarrh. In the beginning of November, 1908, he complained of "slight continuous fever, troublesome cough, and weakness." On close questioning he admitted having spit blood once or twice while he had the bronchial catarrh. He was again carefully examined, and the right apex was found to be affected; movements very much diminished, percussion note dull, and a few rales. He was given guaiacol, arsenic, etc., and was advised to go for a change. In about a month he returned almost in the same condition. His sputum was examined on three different occasions, and every time tubercle bacilli were present. He went to his native country, and I have not heard from him since.

CASE II.—A Hindu merchant, aged 25, consulted me on November 2nd, 1908, for slight fever, headache, pus expectoration, weakness, and loss of flesh. Copper-coloured spots were seen on his body, and he admitted, after great hesitation, having had syphilis about two years earlier. He also admitted having gonorrhoea about eight years ago. For syphilis he was treated by a qualified practitioner, who was good enough to inform me, on inquiry, that he had treated him for primary syphilis. For gonorrhoea and secondaries he was treated by a native hakim. His present complaint was of about ten months' duration. He had consulted several medical men, but as they all gave him quinine and told him that he was suffering from malarial fever, prevalent in our city, he resorted

to patent medicines for malarial fever. Not finding relief, his relatives brought him to me. His temperature was 102° F.; voice peculiar; both apices dull, with well marked crepitations; on the right side the physical signs had extended as far as the third intercostal space. The sputum was somewhat nummular. Tubercle bacilli were present. The usual treatment was prescribed, and the patient was advised to go for a change to his native country at Cutch Mandvi, so as to enjoy fresh air and be free from business worry. Some time ago I heard from his relatives that the patient felt a little better.

In both the cases syphilis had been contracted first and the lung lesion afterwards. Syphilis had impaired the general health of these patients, the final result being the lung affection. After quoting the opinions expressed by Walshe, Aitken, Fagge, Roberts, and Williams, Dr. Engineer pointed out that, as tubercle bacilli were present in both his cases, there could be no doubt of the actual existence of phthisis pulmonalis. In both cases the pulmonary followed the skin lesions. The patients were neither intemperate nor destitute. The occurrence of syphilis and tubercle in the same part might have been a mere coincidence, but Dr. Engineer did not think so. He had refrained from prescribing potassium iodide, the use of which had been recommended in destructive disease of the lungs in syphilis, because the bacteriological examination showed that both patients were suffering from phthisis pulmonalis, but he thought there could be no doubt that in them syphilis had played a part in the causation of phthisis pulmonalis. He summarized his conclusions as follows: (1) Syphilis is related to phthisis either directly or indirectly; (2) syphilis does act as one of the conditions which affect the general health of the individual; and (3) syphilis is one of the predisposing causes of phthisis and to a greater extent than thought of at present by medical men.

CAPE OF GOOD HOPE (EASTERN PROVINCE) BRANCH.

A REGULAR meeting of this Branch was held at the residence of Dr. FitzGerald on Friday, February 19th, at 9 p.m.

Dinner.—The meeting was preceded by a dinner held at Steinman's Hotel at 7.30 p.m., at which the following were present: Dr. G. E. FITZGERALD in the chair, Drs. A. Cowper, Bruce-Bays, Dr. Drury, C. F. Lillie, R. F. Harrison, R. C. Mullins, and, as visitors, William Robertson, M.R.C.V.S., H. Conder, and Dr. Duerden, of Rhodes College, all of Grahamstown.

Letters.—Letters of apology from Drs. F. A. Saunders and Jones-Phillipson. Letters were read from Dr. Greuffell from Dr. Mullins; from Dr. Moffatt, Honorary Secretary, Western Branch; from the Medical Secretary, British Medical Association, and from Dr. Greenlees, our Member of Central Council.

South African Committee.—In the matter of the South African Committee of the British Medical Association, it was resolved:

To request the Central Council (1) to sanction the formation of the South African Committee of the British Medical Association; (2) to delegate to it congresses, transactions, scheme of medical defence or benevolence, code of ethics, ethical decisions, medical politics, and other powers to be defined in the regulations; (3) to approve the draft regulations, with the exception of No. 25, which is not constitutional.

The appointment of Dr. Campbell-Watt to take the necessary steps to approach the Central Council was also approved.

Correspondence with Postmaster-General.—Dr. FITZGERALD read correspondence with the Postmaster-General on the subject of the delivery of telegrams not formally addressed to "Dr." —; in this connexion a resolution was passed for submission to the official concerned.

Presentations to Branch Museum.—It was resolved that Dr. Jones Phillipson be thanked for his generous presentation of twenty assorted pathological jars to the museum of the Branch; also that Mr. William Robertson be thanked for his offer of a specimen of tuberculous lung in the cow.

Presidential Address.—Dr. G. E. FITZGERALD then read his presidential address, which dealt with the early medical history of the colony and of the town of Grahamstown from 1804 to about 1850, and which was enlivened by anecdote and by quotation from original documents.

CAPE OF GOOD HOPE (WESTERN PROVINCE)
BRANCH.

A SPECIAL meeting was held on February 27th, Dr. JASPER ANDERSON, President, in the chair. Fifteen members were present.

Report of the Parliamentary Committee.—A report from the Parliamentary Committee was submitted to the Branch. It suggested amendments to be aimed at in the expected Medical Act Amendment Bill. In the main the report was adopted.

Committees.—The resolutions and regulations of the proposed South African Committee of the South African Branches were adopted. It was decided to amalgamate the Post-graduate and Clinical Committees.

CEYLON BRANCH.

Election of Officers.—The following have been elected officers for 1909: President, Dr. H. Geo. Thomas; President-elect for 1910, Dr. Aldo Castellani; Vice-Presidents, Dr. S. Hallock, Dr. E. Roberts; Representative on the Council of the Parent Association, (under consideration); Representative at the Annual Meeting at Belfast, (under consideration); Secretary and Treasurer, Dr. S. C. Paul; Members of the Council, Dr. F. Grenier, Dr. W. P. Rodrigo, Dr. J. Homer, Dr. M. Sinnatamby.

MIDLAND BRANCH:

BOSTON AND SPALDING DIVISION.

A MEETING of this Division was held at the White Hart Hotel on Friday, March 12th, at 2.45 p.m. There was a small attendance owing to bad weather. Dr. MASON was in the chair. There were also present: Drs. Crofton, Mann, Miller, Pilcher, South, Wilson, and Witham.

Confirmation of Minutes.—The minutes of the last meeting were read and confirmed.

Votes of Thanks.—A vote of thanks was cordially passed to Dr. John McCormac, of London, for his kindness in coming down on December 10th, and also to Mr. Percy Smith, Lindrum House, Boston, for kindly entertaining the members on that occasion.

Medical Treatment of School Children.—It was proposed, after some discussion, by Dr. CROFTON and seconded by Dr. WITHAM:

That those children whose parents cannot afford to pay for medical treatment be treated by the Poor Law medical officer, who should make some special arrangement for this purpose with the guardians. Those parents able to pay should be referred by the medical inspector to their ordinary medical attendant. That school clinics for the Boston and Spalding Division's area are unnecessary and impracticable.

Carried unanimously.

The Association Library.—Dr. MANN proposed and Dr. MILLER seconded:

That the Central Library be granted powers to make it a lending library, so that provincial members may be able to use it. That members defray the cost of carriage one way.

Carried unanimously.

Whole-time Medical Officers of Health.—It was proposed by Dr. WILSON and seconded by Dr. MILLER:

That the whole-time medical officers of health are preferable, and should be debarred from engaging in private practice. That they should not hold any other appointments, and, in case of resignation, should not be allowed to practise within the area for which they have acted as medical officers of health.

Carried unanimously.

Cases.—Dr. CROFTON showed a case of diabetes in a child treated by a preparation made from the internal secretions of the pancreatic gland. Ordinary diet had been allowed, and there was, after a year's treatment, marked improvement in general health and a steady diminution of glucose excreted. Amount of urine excreted per diem had been reduced from 15 pints to 3½ pints. Dr. MANN showed a case of a child aged 5 years with symptoms of intracranial tumour. The pupils were widely dilated and a good view of the fundi obtained. The child had become rapidly worse of late. Dr. Mann thought the tumour implicated the optic chiasma. Dr. SOUTH showed a man suffering from exophthalmic goitre. The peculiarity of the case was the limitation of the exophthalmos to the left eye. The thyroid gland was enlarged generally;

pulse-rate 90 (he was taking digitalis). He was improving under treatment. The medical men were cordially thanked for the interesting cases. No time remained to see the specimens.

Tea.—The members had tea in the hotel afterwards.

SOUTH MIDLAND BRANCH:
BUCKS DIVISION.

THE first meeting of this Division was held on Tuesday, March 30th, in the Board Room of the Royal Bucks Hospital, Aylesbury. Twenty-three members were present, or 40 per cent. of the total membership. The names were: Drs. Baker, Bradbrook, Benson, F. A. Cooke, Carruthers, Crawley, Durran, Eagles, Graham, Larking, Magrath, Morrison, Macfarland, Perrin, Rose, Reynolds, Shaw, Turner, West, and Wheeler. Three visitors attended: Drs. Wm. Hill, H. Harrison, and Norman.

Apologies for Non-attendance.—Apologies for absence were sent by Drs. Bradshaw, Gardner, Hardwick, Pemberton, and Lucas.

Election of Officers.—After the adoption of the rules the following officers were elected: Chairman, Dr. J. C. Baker; Vice-Chairman, Dr. Reynolds; Secretary, Dr. Larking; Members of Branch Council, Drs. Benson and Durran; Committee, Drs. Gardner, Graham, Turner, West, Morrison, and Humphrey-Wheeler.

Resolutions.—The resolutions on the agenda were carried.

Demonstration.—Dr. Wm. HILL then gave a demonstration on recent methods of throat examination by direct vision. He showed the vocal cords, bifurcation of the trachea, etc., on several patients and also numerous instruments used. The members were much interested, and passed a hearty vote of thanks to him for his most instructive demonstration.

Medical Inspection of School Children.—Dr. CARRUTHERS introduced the subject of medical inspection of children. After remarks by Drs. DURRAN, WHEELER, SHAW, LARKING, and GRAHAM, the following resolution was passed:

That this meeting considers that if any further appointments are necessary in this county for the medical inspection of school children the general practitioners of each district should have the opportunity of performing the work under the supervision of the county medical officer.

In reference to the fee it was resolved:

1. That this Division approves of the system of payment per head.
2. That the fee should be 2s. 6d. per child for each inspection.

Treatment of School Children Found Defective.—The question of treatment was discussed by Drs. BRADBROOK, LARKING, CARRUTHERS, BENSON, and DURRAN, and finally the following resolution was carried, with one dissentient:

That this Division considers that in this county no special provision is necessary for the treatment of defective school children; it deprecates the establishment of "school clinics" or "recognized surgeries," and believes that all cases can be dealt with by the ordinary medical attendant, who could, whenever necessary, suggest where special treatment could be obtained. This Division is firmly of opinion that, if the education authorities pay for the treatment of some children and refuse others, it will lead to dissatisfaction among parents, and will ultimately lead to the exploitation of the services of medical men and injuriously affect private practice.

WEST SOMERSET BRANCH.

THE spring meeting of this Branch was held at the Taunton and Somerset Hospital on Friday, April 2nd, the chair being occupied by Dr. H. T. S. AVELINE, the President.

Confirmation of Minutes.—The minutes of the last meeting were read and signed.

Clinical Cases.—Dr. J. W. RUTHERFORD showed an inmate of Cotford Asylum suffering from a skin disease of a scaly nature affecting the lower part of the abdomen, penis, etc. The diagnoses which at different times have been suggested include tuberculosis, syphilis, and actinomycosis. Mr. A. J. H. ILES showed an excellent series of skiagraphs depicting various bone diseases in which assistance in diagnosis may be obtained by x rays. He read short explanatory notes which were much appreciated. Mr. A. E. JOSELYNE showed a boy with a "port wine" stain involving half of his face, and on which he had recently commenced treatment with high-frequency currents.

Dr. SANGUINETTI read notes of a case of bronchiectasis the symptoms of which first appeared fourteen days after the extraction of several teeth under an anaesthetic, and which was subsequently treated with vaccines. He also read notes on a case of pernicious anaemia. Dr. CALDWELL showed a female patient, at present an inmate of Taunton Hospital, whose abdomen was covered with numerous cicatrices resulting from eight distinct laparotomies performed upon her "in another place," and from all of which she had recovered. He also showed a spleen from a case of spleno-medullary leukaemia.

Medical Certificates of Suitability for Hospital Treatment.—The opinion of the meeting was taken on the following resolution, which will come before the Representatives at their next meeting:

That a medical certificate of suitability for hospital treatment be required as a condition of hospital treatment, except in the case of casualties.

After some discussion it was unanimously resolved that the Representative be instructed to vote for the resolution.

Tea was served at the conclusion of the meeting.

To ensure the insertion of notices in this column, they must be received at the Central Offices of the Association not later than the first post on Tuesday.

Association Notices.

COUNCIL MEETING.

A MEETING of the Council will be held at 2 o'clock in the afternoon of Wednesday, April 28th, in the new Council Room, at 429, Strand, London, W.C.

By Order,
GUY ELLISTON.

March 25th, 1909.

BRANCH AND DIVISION MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH: ENGLISH DIVISION.—A meeting of the Division will be held at the George Hotel, Penrith, on Friday, April 23rd, at 3 p.m. The Honorary Secretary will be pleased to hear from members who wish to read papers or show cases or pathological specimens.—NORMAN MACLAREN, Honorary Secretary, 23, Portland Square, Carlisle.

DORSET AND WEST HANTS BRANCH.—The spring meeting of this Branch will be held in Dorchester on Wednesday, May 5th. Members wishing to read papers, show cases, exhibit specimens, or propose new members, are requested to communicate, not later than Thursday, April 22nd with JAMES DAVISON, Honorary Secretary, "Sireatplace," Bournemouth.

LANCASHIRE AND CHESHIRE BRANCH: ALTRINCHAM DIVISION.—A general meeting will be held at the Greenbank Hotel, Northwich, at 5 p.m., on Wednesday, April 21st, to receive reports from the Executive Committee, to consider matters referred to Divisions, and to transact the usual business. At 6 p.m. Dr. Manwaring White will read a paper on Frontal Sinusitis as a Complication of Influenza. Dinner at 7 p.m.—T. W. H. GARSTANG, Honorary Secretary.

MIDTROPOLITAN COUNTIES BRANCH.—*Nominations of Branch Officers.*—Pursuant to By-law 25, notice is hereby given that nominations for all the officers of the Branch—namely, President-elect, Vice-Presidents, Secretary, members of the Branch on the Central Council of the Association—must be sent in to the Honorary Secretary of the Branch on or before May 29th. Voting papers will be sent out on or before June 5th, and must be returned to the Secretary on or before June 12th.—ATWOOD THORNE, E. W. GOODALL, Honorary Secretaries.

MIDLAND BRANCH: BOSTON AND SPALDING DIVISION.—An ordinary meeting of the above Division will be held on Tuesday, April 20th, at 2.45 p.m., at the White Hart Hotel. Agenda: Dr. Stanley Green, of Lincoln, will read a paper on Some Sore Throats, and give a demonstration of skiagrams illustrating some diseased conditions of bone. Tea will be provided for those desiring it, as on former occasions. Members who wish to be present are requested to intimate their intention by April 18th to A. E. WILSON, Honorary Secretary.

NORTH WALES BRANCH.—A meeting of the Branch will be held at the Colwyn Bay Hotel, Colwyn Bay, on Tuesday, April 20th, at 2.30 p.m. Luncheon at 1.30 p.m.; tickets, 2s. 6d. Agenda: (1) To read the minutes of the last meeting. (2) To read correspondence. (3) To receive the report of the Branch

Council. (4) To read the financial statement for 1908. (5) To adopt, if approved of, the model rules for the regulation of procedure in ethical matters. (6) To read a letter from the council of the University College of North Wales re the terms of the award of the Jones Morris Memorial Prize, and to reconsider the terms. The following papers will be read, specimens shown, etc.:—Dr. Craufurd T. Matthews: A Case of Multiple Maldevelopments. Drs. R. E. Lord and H. Nuttall: A Case of Intestinal Obstruction with Marked Enterospasm. Mr. G. P. Newbolt: (1) A note on Three Cases of Emergency Intestinal Operations; (2) Hair Bolus Removed from Stomach. Mr. R. W. Monsarrat: Hydronephrosis. Dr. W. B. Warrington: Principles of Diet in Nephritis. Mr. J. Howell Evans: The Diagnostic Value of the Gastro-duodenoscope. The instrument will be shown. Dr. J. Elliott: Cultures and Lumière Photomicrographs of Bacteria, illustrating some recent cases (exhibited on the screen). Dr. W. Blair Bell: Case of Uterus Didelphys with Ectopia of Uterine Bodies (with specimens). Mr. H. E. Jones: Practical note on Glaucoma. Dr. J. E. Gemmell: The Influence of Fibroids of the Uterus on Pregnancy, Gestation, and the Puerperium. Dr. J. Lloyd Roberts: A Case of Tetanus. Dr. O. T. Williams: The Influence of Unsaturated Fats in Diet, with especial reference to Tuberculosis. The Branch Council will meet at 12.30 p.m.—H. JONES ROBERTS, Honorary Secretary, Penryn, S.O.

SOUTH MIDLAND BRANCH: NORTHAMPTONSHIRE DIVISION.—A meeting of the Division will be held on Tuesday, April 20th, at 2.30, in the Board Room of the Northants General Hospital. There will be a luncheon beforehand at Franklin's Restaurant, Guildhall Road, at 1.30. Names of those wishing to attend the luncheon should be sent in two days beforehand to the Secretary. Business.—Report of Executive Committee. Matters referred to Divisions: (1) Report on medical certificates of suitability of patients for hospital treatment; (2) Report on contributions to hospitals by employers of labour and employees; (3) Statement as to fresh public medical institutions; (4) Statement as to sanatoriums for workers suffering from tuberculosis (cf. SUPPLEMENT, February 27th); (5) Departmental Committee re Midwives Act; (6) Questions of health officers being whole-time officers (cf. SUPPLEMENT, January 23rd). Clinical cases.

STAFFORDSHIRE BRANCH.—The third general meeting of the session will be held at the Victoria Hotel, Wolverhampton, on Thursday, April 29th. The President, Dr. S. King Alcock, will take the chair at 5.25 p.m. Business: (1) Minutes of the last general meeting. (2) Correspondence. (3) Exhibition of living cases. Papers:—(a) Dr. W. Spencer Badger: The Chest of the Elementary School Child. (b) Dr. J. A. Codd: The Treatment of Glandular Enlargements by X Rays. (4) Exhibition of Pathological Specimens, etc. Dinner at 7 p.m.; charge, 5s. A meeting of the council will be held immediately before the general meeting to fix the date of the annual council meeting.—G. PETERCAVE JOHNSON, Honorary General Secretary, Stoke-on-Trent.

ULSTER BRANCH.—The spring meeting of this Branch will be held in Londonderry on Saturday, May 8th. Members having communications to make to the meeting are requested to send particulars not later than April 30th to CECIL SHAW, Honorary Secretary, 29, University Square, Belfast.

MEDICAL ACTS AMENDMENT BILL (ANAESTHETICS).

MEMORANDUM.

THE object of this bill is to require a medical practitioner applying for registration on or after January 1st, 1911, to submit evidence of having received practical instruction in the administration of anaesthetics, and to prohibit any person not a registered medical practitioner administering an anaesthetic except under certain conditions, to safeguard the rights of all persons registered as dentists before the commencement of the Act. To prohibit any certificate of death being given in the case of any person dying under an anaesthetic.

ARRANGEMENT OF CLAUSES.

- Clause.
1. Additional qualification required for registration under Medical Acts.
2. Penalties attaching to the administration of anaesthetics by unauthorized persons.
3. Power to General Council to make regulations.
4. Penalty for giving death certificate in case of persons dying under anaesthetics.
5. Dentists' anaesthetic.
6. Prosecutions.
7. Definitions.
8. Short title.

A BILL to regulate the administration of anaesthetics, to make regulations relative thereto, and to amend the Medical Acts.

Be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual

and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

1. *Additional Qualification Required for Registration under Medical Acts.*—On and after the first day of January one thousand nine hundred and eleven, no person shall be registered under the Medical Acts in respect of any qualification referred to in any of those Acts unless he shall have produced evidence that he has received theoretical and practical instruction in the administration of anaesthetics.

2. *Penalties Attaching to the Administration of Anaesthetics by Unauthorised Persons.*—Any person not a registered medical practitioner who shall administer or cause to be administered to any other person, by inhalation or otherwise, any gas or vapour, or drug or mixture of drugs, solid or liquid, with the object of producing unconsciousness during any medical or surgical operation, examination, act or procedure, or during childbirth, shall be liable on conviction before a court of summary jurisdiction for such offence, to a penalty not exceeding ten pounds, and, in the case of any subsequent conviction, to a penalty not exceeding twenty pounds: Provided that a person shall not be liable to a penalty under this section if in conducting such administration he was acting under the immediate direction and supervision of a registered medical practitioner, or if the circumstances attending the administration were such that he had reasonable grounds for believing and did believe that the delay which would have arisen in obtaining the services of a registered medical practitioner would have endangered life.

3. *Power to General Council to make Regulations.*—Power is hereby given to the General Council to make any regulation or order to carry out the requirements of this Act.

4. *Penalty for Giving Death Certificate in Case of Persons Dying under Anaesthetics.*—Any registered medical practitioner who gives a certificate of death in the case of any person dying while under the influence of an anaesthetic shall be liable, on summary conviction, to a penalty not exceeding five pounds.

5. *Dentists' Anaesthetic.*—Nothing in this Act shall prohibit a person registered under the Dentists Act, 1878, before the commencement of this Act, administering an anaesthetic during a dental operation or procedure.

6. *Prosecutions.*—Offences under this Act may be prosecuted and all fines recovered in manner provided by the Summary Jurisdiction Acts.

In the application of this Act to Scotland the expression "Summary Jurisdiction Acts" shall mean the Summary Jurisdiction (Scotland) Acts, 1864 and 1881, and any Act amending the same.

In the application of this Act to Ireland the expression Summary Jurisdiction Acts shall mean a court of summary jurisdiction constituted in the manner mentioned in the two hundred and forty-ninth section of the Public Health (Ireland) Act, 1878.

7. *Definitions.*—The expression "Medical Acts" means the Medical Act, 1858, or any amendment of that Act.

The expression "General Council" means the General Council of Medical Education and Registration in the United Kingdom.

The expression "registered medical practitioner" means a person registered under the Medical Act, 1858, or any amendment of that Act.

8. *Short Title.*—This Act may be cited as the Anaesthetics Act, 1909.

the *Iphigenia*, April 13th; Staff Surgeon M. CAMERON, M.B., to the *Attentive*, April 13th this appointment to the *Cressy* being cancelled; Staff Surgeon W. B. MACLEOD, M.B., to the *Bonaventure*, April 13th; Surgeon M. T. MALL, M.B., to the Royal Marine Artillery, Eastern, April 7th; Surgeon P. T. NICHOLS, to the *Victory*, additional, for disposal, April 13th; Surgeon E. CAMERON, M.B., to the *Terrible*, April 13th; Surgeon S. F. DUDLEY, to the *Commonwealth*, April 13th. Mr. H. D. JOHNS, civil practitioner, has been appointed Surgeon and Agent at Hornsea and Aldborough, April 6th.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

ALDERSON, and G. O. M. DICKESSON, M.B., to the *President*, additional, for three months' course at West London Hospital, April 13th; Staff Surgeon J. WHELAN, to the *Cressy*, April 13th; Staff Surgeon A. J. WERNET, M.B., to the *Cressy*, April 13th; Staff Surgeon A. J. WERNET, M.B., to

Vital Statistics.

HEALTH OF ENGLISH TOWNS.

In seventy-six of the largest English towns, including London, 8,802 births and 5,653 deaths were registered during the week ending Saturday, April 3rd. The annual rate of mortality in these towns, which had been 22.1, and 19.8 per 1,000 in the two preceding weeks, further declined to 17.9 per 1,000 in the week under notice. The rates in the several towns ranged from 6.0 in Hornsey, 8.0 in Walthamstow, 8.3 in Barrow-in-Furness, 8.9 in Smethwick, 9.1 in Willesden, and 9.7 in Handsworth (Stals) to 27.5 in Liverpool, 28.3 in Preston, 29.4 in Oldham, 27.0 in Wigan, 27.5 in Great Yarmouth, 28.1 in Warrington, and 30.7 in St. Helens. In London the rate of mortality was equal to 18.3 per 1,000, while it averaged 17.8 in the seventy-five other large towns. The deaths from the principal infectious diseases averaged 1.8 both in London and in the seventy-six towns as a whole; the highest

death-rates from these diseases were 3.6 in Portsmouth and in Birmingham, 3.8 in Reading and in Bootle, 3.9 in West Hartlepool, 4.0 in Preston, 8.6 in Wigan, 9.4 in Warrington, and 15.9 in St. Helens. Measles caused a death-rate of 2.4 in Portsmouth, 2.8 in Warrington, 2.9 in Sunderland, 3.1 in Reading and in Sheffield, 3.3 in Bootle, 3.9 in West Hartlepool, 4.6 in Wigan, 8.7 in Warrington, and 14.8 in St. Helens; diphtheria of 1.1 in Huddersfield; whooping-cough of 1.1 in St. Helens and in Swansea, 1.7 in Norwich and 3.1 in Preston; and diarrhoea of 2.9 in Wigan. The mortality from scarlet fever and from enteric fever showed no marked excess in any of the large towns. One fatal case of small-pox was registered in Bristol, but none in any other of the large towns. The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had been 2,670 and 2,571 at the end of the three preceding weeks, had further declined to 2,462 at the end of the period under notice; 273 new cases were admitted during the week, against 279 and 327 in the two preceding weeks.

During the week ending Saturday last, April 10th, 8,320 births and 5,364 deaths were registered in seventy-six of the large English towns. The annual rate of mortality in these towns, which had been 22.1, 19.8, and 17.9 per 1,000 in the three preceding weeks, further declined last week to 17.0, 16.0, and 15.0. The rates in the several towns ranged from 4.9 in Horsey, 7.8 in Stockton-on-Tees, 8.2 in Handsforth (Staffs.), 8.4 in Walthamstow and in Ipswich, 8.8 in Rotherham, 8.9 in Leyton, and 9.6 in Burton-on-Trent, to 22.7 in Brighton, 22.8 in Swansea, 23.9 in Sunderland, 24.8 in Warrington, 25.1 in Wigan, 25.2 in Liverpool, 25.2 in Middlesbrough, 29.0 in Tynemouth, and 31.8 in St. Helens. In London the rate of mortality was 15.9 per 1,000, while it averaged 17.4 per 1,000 in the seventy-five other large towns. The death-rate from the principal infectious diseases averaged 2.2 per 1,000 in the thirty-five large towns; in London the death-rate from these diseases was 1.8 per 1,000, while among the seventy-five other large towns the rates ranged upwards to 4.0 in Wolverhampton, in Stockport and in Wigan, 4.5 in Bolton, 4.6 in Manchester, 6.5 in Sunderland, and 10.4 in St. Helens. Measles caused a death-rate of 2.0 in Wolverhampton and in West Hartlepool, 2.2 in Smethwick, 2.5 in Stockport, 2.6 in Birmingham, 2.9 in Wigan, 3.0 in Bootle, 3.1 in Reading, 3.3 in Sheffield, 3.2 in Sunderland, and 8.2 in St. Helens; scarlet fever of 1.3 in King's Norton and 2.2 in Walsall; diphtheria of 1.0 in Portsmouth and in Wolverhampton, and 1.2 in Rhondda; whooping-cough of 1.0 in Walsall and in Stockport, 1.1 in St. Helens, 1.2 in York, 1.3 in Coventry, and 1.5 in Rhondda; "fever" of 1.0 in Middlesbrough and 1.1 in Huddersfield; and diarrhoea of 1.1 in Swansea, 1.2 in Aston Manor, and 1.5 in Smethwick. No fatal case of small-pox was registered in any of the seventy-six towns last week. The number of scarlet fever patients under treatment in the Metropolitan Asylums hospitals and the London Fever Hospital, which had been 2,586, 2,570, and 2,462 at the end of the three preceding weeks, had further declined to 2,418 at the end of last week; 256 new cases were admitted during the week, against 279, 327, and 273 in the three preceding weeks.

HEALTH OF SCOTTISH TOWNS.

In eight of the principal Scottish towns, 957 births and 712 deaths were registered during the week ending Saturday, April 10th. The annual rate of mortality in these towns, which had been 21.6, 21.1, and 20.5 per 1,000 in the three preceding weeks, further declined to 19.9 per 1,000 in the week under notice, but was 20.9 in the two preceding weeks. During the same period in the seventy-six large English towns. Among these Scottish towns the death-rates ranged from 13.8 in Aberdeen and 15.2 in Leith to 23.3 in Paisley and 24.5 in Greenock. The death-rate from the principal infectious diseases averaged 2.2 per 1,000, the highest rates being recorded in Glasgow and Aberdeen. The 360 deaths registered in Glasgow included 4 which were referred to scarlet fever, 6 to diphtheria, 32 to whooping-cough, 2 to enteric fever, 1 to cerebro-spinal meningitis, and 8 to diarrhoea. Nine fatal cases of whooping-cough were recorded in Aberdeen; 2 of whooping-cough and 3 of diarrhoea in Dundee; and 3 of whooping-cough, 2 of diarrhoea, and 1 of cerebro-spinal meningitis in Edinburgh.

During the week ending Saturday last, April 10th, 339 births and 634 deaths were registered in these Scottish towns. The annual rate of mortality, which had declined from 21.6 to 19.9 in the four preceding weeks, further fell to 17.7 per 1,000 last week, but was 0.7 per 1,000 above the mean rate during the three preceding weeks. The rates in the large English towns. The death-rates in the eight Scottish towns ranged from 11.9 in Paisley and 13.4 in Leith to 19.6 in Glasgow and 20.6 in Dundee. The death-rate from the principal infectious diseases averaged 2.5 per 1,000, the highest rates being recorded in Glasgow and Dundee. The 327 deaths registered in Glasgow included 3 from scarlet fever, 4 from diphtheria, 42 from whooping-cough, 4 from enteric fever, 2 from cerebro-spinal meningitis, and 8 from diarrhoea. Three fatal cases of whooping-cough were recorded in Edinburgh; 2 of diphtheria, 2 of whooping-cough, and 3 of diarrhoea in Dundee; 1 of measles and 2 of whooping-cough in Aberdeen; and 3 of whooping-cough in Greenock.

HEALTH OF IRISH TOWNS.

During the week ending Saturday last, April 10th, 691 births and 531 deaths were registered in the twenty-two principal urban districts of Ireland, as against 636 births and 550 deaths in the preceding period. The annual death-rate in these districts, which had been 23.9, 26.1, and 25.1 per 1,000 in the three preceding weeks, fell to 23.1 per 1,000 in the week under notice, this figure being 6.3 per 1,000 higher than the mean annual death-rate in the seventy-six English towns for the corresponding period. The figures in Dublin and Belfast were 25.9 and 21.6 respectively, those in other districts ranging from 15.1 in Limerick and 15.3 in Limerick to 18.0 in Cork and 35.6 in Cork, while Londonderry stood at 25.6, Limerick at 26.0, and Waterford at 15.6. The zymotic death-rate in the twenty-two districts averaged 2.0 per 1,000, as against 1.1 per 1,000 in the preceding period.

Hospitals and Asylums.

CITY OF LONDON ASYLUM.

The annual report of Dr. R. Hunter Steen, the Medical Super-tendent of the City of London Asylum, Stoke Newington, Dartford, for the year 1908 shows that there were 558 patients in residence, and that on the last day of the year there were 579. The total cases under care during the year numbered 717, and the average number daily resident 570. In former reports the large number of aliens admitted to this asylum has been commented upon, and we note that of the total 579 resident in this institution at

the end of the year, 31 were of foreign birth, hardly a European State being unrepresented. During the year 159 patients were admitted, of whom 145 were first and 14 not-first admissions. In 60 the attacks were first attacks within three and in 13 more within twelve months of admission; in 37 not-first attacks within twelve months of admission and in the remainder the illness was already of more than twelve months (41) or of unknown duration (5) or of congenital origin. As regards duration of disorder, the admissions were thus not of a very favourable character, and Dr. Steen reported that recovery was considered probable in only 34, or 21 per cent., and that 74, or 46 per cent., were practically incurable. The greater number, also, were in poor bodily condition on admission. With regard to the forms of mental disorder, the admissions were classified into: Mania of all kinds, 41; melancholia of all kinds, 40; secondary and senile dementia, 12; general paralysis of the insane, 11; delusional insanity, 22; alcoholic insanity, 15; dementia praecox, 6; puerperal insanity, 3; stupor and acquired epilepsy, 2 each; confusional insanity and moral insanity, 1 each; and cases of congenital or infantile defect, 3. The total incidence of the etiological factors in the admissions—excluding 31 who were transfers—is stated in the report as follows: Alcohol in 24, or 18.7 per cent.; acquired syphilis in 2; critical periods in 7; child-bearing in 3; physiological defects and errors in 4; diseases of the nervous system in 3; mental stress in 2; and in 42 no principal factor was assigned. In 9, or 7 per cent., an insane heredity was ascertained; in 1 a heredity of marked eccentricity; and in 3 there existed moral or congenital mental deficiency. During the year, 34 were discharged as recovered, giving a recovery-rate of 26.56 per cent. on the admissions, exclusive of transfers; 64 as relieved, and 11 as not improved. During the year also 29 died, giving the low death-rate on the average numbers resident of 6.08 per cent. The deaths were due in 10 to diseases of the nervous system, including 8 from general paralysis; in 5 to diseases of the heart and blood vessels; in 3 to respiratory diseases; in 3 to chronic Bright's disease; in 2 to carcinoma; and in 5, or 17 per cent., of the total deaths to tuberculosis. All deaths were from natural causes, and the general health was good throughout the year. Two sporadic cases of enteric fever of mild type, and 2 cases of colitis occurred, but otherwise the institution was free from zymotic disease.

GENERAL HOSPITAL, BIRMINGHAM.

The 129th annual report of the General Hospital shows that during the year 1908, 5,526 in-patients and 65,551 out-patients were treated, making a total of 71,077. The ordinary expenditure was £25,011, and the extraordinary £1,116, while the sum of £439 was transferred to the Jaffray Branch Account to meet the deficit at that institution, making a total expenditure for the year of £26,567. The ordinary income was £19,681, and the total income from all sources £24,208. The deficit at the end of 1907 of £7,698 was increased to £10,605. The scheme for the reference elsewhere of trivial cases after giving first aid, which was especially referred to in the last report, came into force on March 23rd, 1908. Since that date, 2,294 cases after receiving first aid have been referred to dispensaries, general practitioners, clubs, or elsewhere according to their circumstances. Of these, 33 were out-patients, 54 medical casualties, and 2,207 surgical casualties, not including a number of cases which after treatment for short time proved to be trivial, and were then referred elsewhere. In spite of this scheme there was an actual increase of 3,449 in the number of out-patients treated. It is satisfactory to note that this is partly due to the more careful record taken, there having been an actual diminution of the old cases attending weekly. In November the matron, Miss M. E. Jones, resigned her post on account of ill-health. The board placed on record its regret at the cause of her resignation, and its appreciation of her valued services to the hospital during a period of ten and a half years. She has been succeeded by the medical and nursing staff of the hospital. Miss E. M. Musson (Matron of Swansea General and Eye Hospital, and formerly Assistant Matron of St. Bartholomew's Hospital, London) has been appointed matron.

Vacancies and Appointments.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column, advertisements must be received not later than the first post on Wednesday morning.

VACANCIES.

- ASHTON-UNDER-LYNE: DISTRICT INFIRMARY.—Junior House-Surgeon. Salary at the rate of £75 per annum.

MEMBERSHIP OF THE BRITISH MEDICAL ASSOCIATION.

THE British Medical Association exists for the promotion of medical and the allied sciences, and the maintenance of the honour and the interests of the medical profession.

The Annual Subscription to the British Medical Association is £1 5s. 0d., and the BRITISH MEDICAL JOURNAL is supplied weekly, post free, to every member of the British Medical Association, wherever he may reside.

Forms of application for membership can be obtained from the General Secretary, 429, Strand, W.C.

The principal rules governing the election of a medical practitioner to be a member of the British Medical Association are as follow :

Article III.—Any Medical Practitioner registered in the United Kingdom under the Medical Acts and any Medical Practitioner residing within the area of any Branch of the Association situate in any part of the British Empire other than the United Kingdom, who is so registered or possesses such medical qualifications as shall, subject to the regulations, be prescribed by the Rules of the said Branch, shall be eligible as a Member of the Association. The mode and conditions of election to Membership shall from time to time be determined by or in accordance with the By-laws. Every Member, whether one of the existing Members or a subsequently-elected Member, shall remain a Member until he ceases to be a Member in accordance with the provisions hereof.

By-law 1.—Every candidate for Membership of the Association shall apply for election in writing, addressed to the Association, and stating his agreement, if elected, to abide by the Regulations and By-laws of the Association, and the Rules of such Division and Branch to which he may at any time belong, and to pay his subscription for the current year.

By-law 2.—Every candidate who resides within the area of a Branch shall forward his application to the Secretary of such Branch. Notice of the proposed election shall be sent

by the Branch Secretary to the General Secretary of the Association, and to every Member of the Branch Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Branch Council at any meeting thereof held not less than seven days (or such longer period as the Branch may by its Rules prescribe) after the date of the said Notice. A Branch may by special Resolution require that each candidate for election to the Association shall furnish a certificate from two Members of the Association to whom he is personally known. Officers of the Navy, Army, and Indian Medical Services on the Active List are eligible for election through the Council or a Branch without approving signatures as laid down in By-law 3.

By-law 3.—Every candidate whose place of residence is not included in the area of any Branch shall forward his Application to the General Secretary of the Association, together with a statement signed by three Members of the Association, that from personal knowledge they consider him a suitable person for election. Notice of the proposed election shall be sent by the General Secretary to every Member of the Council, and the candidate, if not disqualified by any Regulation of the Association, may be elected a Member of the Association by the Council at any meeting thereof held not less than one month after the date of the said notice.

The annual subscription to the BRITISH MEDICAL JOURNAL for non-members is £1 8s. 0d. for the United Kingdom, and £1 15s. 0d. for abroad.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL.

SPECIAL NOTICE TO MEMBERS.

Every member is requested to preserve this "Supplement," which contains matters specially referred to Divisions, until the subjects have been discussed by the Division to which he belongs. BY ORDER.

MATTERS REFERRED TO DIVISIONS.

ANNUAL REPRESENTATIVE MEETING AT BELFAST.

FRIDAY, JULY 23RD, AND FOLLOWING DAYS.

NOTICES OF MOTION.

The following Notices of Motion have been received for discussion by the Annual Representative Meeting of the Association, to be held at Belfast, July 23rd, 1909, and following days.

A.—NOTICES AFFECTING THE CHARTER.

Election of Representatives.

By the LIVERPOOL (WESTERN) DIVISION (Lancashire and Cheshire Branch):

That in By-law 25 (1) the words "each such Constituency being entitled to elect one Representative," be deleted.

By the LIVERPOOL (WESTERN) DIVISION (Lancashire and Cheshire Branch):

That in By-law 25 (2), for the first word of line 2, "one," substitute "a," and after the word "Constituency" insert the words "to elect one Member"; at the end add the words "Any Division having more than 50 Members may elect another additional Representative for every complete 50 (75, 100, or other number) additional Members."

B.—NOTICES AFFECTING THE PRESENT REGULATIONS OF THE ASSOCIATION.

Mode of Election of Council.

By the COUNCIL:

That the present By-laws of the Association, numbered 23 to 32 inclusive, relative to the composition and mode of election of Council be rescinded, and the corresponding By-laws, numbered 37 to 46 inclusive, in the Schedule to the Draft Charter, be adopted in substitution thereof, subject to such verbal amendments and alterations as the legal advisers of the Association may deem to be necessary.

By the DUNDEE BRANCH:

That the present By-laws relating to the Council, namely, 23 et seq., be amended by substituting for them the provisions of the Schedule to the Draft Charter, namely, Section VI., subject to such verbal amendments as in the opinion of the Association's legal advisers are necessary to bring them into harmony with the present Memorandum and Articles.

By the GATESHEAD DIVISION (North of England Branch):

That having regard to the repeated decisions of the Representative Meeting, confirmed by a large majority upon the Referendum, that the mode of election of the Council should be altered so as to provide for the reduction of the total membership of, and some representation of the Representative Meeting on, the Council, the present By-laws of the Association as to the composition and mode of election of the Council be amended so as to conform with those on the same subject appended to the Draft Charter submitted to the Privy Council.

Standing Committees.

By the COUNCIL:

That the Schedule to the present By-laws of the Association as to Standing Committees be amended by making such verbal changes as are necessary to bring it into conformity with the corresponding Schedule appended to the Draft Charter.

C.—NOTICES AFFECTING THE ADMINISTRATION OF THE ASSOCIATION.**Method of Distribution of Capitation Grants.**

By the WANDSWORTH DIVISION (Metropolitan Counties Branch):

That in view of the facts (1) that the policy of the Association is to consider the Division as the primary unit, each Division being free to govern itself in such a manner as it shall think fit; (2) that the decision as to what additional subjects shall be forwarded to the Divisions for consideration rests with the Representative Body and the Central Council, and not the Branch Councils; this Representative Body considers that it is illogical any longer to place in the hands of Branch Councils the funds for distribution to the Divisions, while at the same time depriving them of any control over the objects for which the money is used, and instructs the Central Council to so amend the By-laws as to place the distribution in the hands of the Central Council, which can make capitation grants to all Divisions and Branch Councils as may be required.

The "British Medical Journal."

By the WATERFORD DIVISION (South-Eastern of Ireland Branch):

That the BRITISH MEDICAL JOURNAL should more largely advocate the rights, interests, and claims of the medical masses in the future than it has done in the past.

Appointment of Materia Medica Committee.

By the WATERFORD DIVISION (South-Eastern of Ireland Branch):
